which every man may feel *sure* that he is properly dressed ; and the dress fixed on for this purpose now throughout the civilized world is the plain suit of black, with the swallow-tailed coat, commonly called "evening dress." Nothing can be simpler or less pretentious, or more democratic. Nobody can add anything to it or take anything away from it. Many attempts to modify it have been made during the last thirty years by leaders of fashion, and they have all failed, because it meets one of the great wants of human nature. Nevertheless, it made its way with difficulty. It is only within the last fifteen years that it has obtained a firm foothold in American cities. People looked on it with suspicion, as a sign of some inward and spiritual naughtiness, and regarded the frock-coat with its full skirts as the only garment in which a serious-minded man, with a proper sense of his origin and destiny, and correct feelings about popular government, could make his appearance in a lady's parlor. Why, nobody could tell, for there was a time, not very far back, when the frock-coat was itself an innovation. Of late, that is, within perhaps twenty years, the Swallow-Tails of the world have exchanged the black or colored for a white cravat, and justify themselves by saying that it not only looks cleaner, but *is* cleaner of necessity than a silk one, and that you cannot look too clean or fresh about your throat when you present yourself in a lady's house on a festive occasion. Nevertheless, the plain, blunt men are not satisfied. They do not as yet feel sure as to its meaning. They think it indicates either overthoughtfulness about trifles or else a leaning, slight though it be, towards despotism and free-trade. They will now all, or nearly all, wear evening dress with a black cravat, but even those of them who will consent to put on a white one do so with a certain shamefacedness and sense of backsliding and of treachery to some good cause, though they do not exactly know which.

## THE ANTI-PRUSSIAN ENCYCLICAL.

BERLIN, March 2, 1875.

MR. REICHENSPERGER declared the other day in the Prussian Landtag that "the Ultramontanes acknowledge the May laws in so far as they willingly submit to the punishments inflicted by them, while otherwise they (the laws) would only too likely be met with the fists." That is a standpoint against the principle of which nothing can be said. It has been the conflict of duties which has thus far secured a respectful sympathy for those candid Ultramontanes whose spokesman Mr. Reichensperger was in the above-mentioned declaration. Now they are no longer allowed to occupy this dearly-paid-for but honorable middle ground. The Encyclical of February 5 has left but one alternative to a man of honor—disobedience to the infallible master or open rebellion against the state. Henceforth only idiots can, without conscious lying, assert that the new doctrines of the Roman Catholic Church are perfectly compatible with the allegiance of the citizens to the state. The Pope declares the so-called Falk Laws "totally null and void," and, what is worth noticing, not because they are against the Laws of *God*, but because they are wholly incompatible with all the rules and doctrines of the *Church*. Now, what the Pope can declare and decree with regard to Prussian laws he evidently can declare and decree with regard to the laws of any other State, and the more so as he "in a certain manner *owns* every man baptized in the name of Christ," as this "servant of servants" was pleased to announce in his letter to the Emperor. Henceforth no law is valid in any Christian commonwealth unless his Holiness has expressly or tacitly consented to its validity.

On one essential point there is no difference of opinion : the Encyclical is not a stroke into the air. The only question is, Who will be hit by it ? As yet one does not know what the Bishops are going to do about it. Will they publish it officially, or will they rest contented with its publication by the daily press ? In either case they will put themselves in an awkward and dangerous position. If they do not publish it officially, their solidarity with the infallible Pope has ceased to exist. Undoubtedly, it is but a small crack ; but here the slightest crack is almost certain to widen and to deepen, and in the course of time it might grow to be a yawning gulf which the infallible one himself might be unable to bridge. And that their refusal of an official publication would be a break in the solidarity of the Pope and the German Bishops there is no possibility of denying. The gist of the joint declaration recently issued by the latter against Bismarck's circular despatch concerning the election of a new Pope, is the assertion that the dogma of infallibility has not in the least produced a change in the relations of the Pope towards either the bishops or the states. It is an utterly unfounded invention of Catholic apostates and Protestants that by this dogma the sovereign power of the Pope has been extended over the proper domain of the State. While the Council were deliberating the dogma these same German Bishops protested against it, "in order to decline all responsibility for it before men and before the terrible judgment of God." "Over night"—to use the expression of Bishop Hefele, who was soon himself to join the rest—they changed their conviction, and ever since they have tried to screen the shame of their submission behind that harmless interpretation of the dogma. However great the powers be which Christ has intended the Bishops to possess, one is not to be found among them—the power to make a compromise with principles and with one's conscience a harmless thing by hiding it under oily words and finespun quibbles. A man like Bishop Hefele ought to have known that the Jesuits, after having obtained the submission of the Bishops to the dogma, would not rest satisfied with an interpretation of it which renders it worthless. As the Bishops have pocketed their protest, so they may now throw their joint declaration into the waste-paper basket, for the Encyclical of February 5 is the practical application of the interpretation given by Peronne, in March, 1871 : "The Pope is the supreme judge over all civil laws. In him the two powers—the spiritual and the temporal—run together as to one point, for he is the *locum tenens Christi*, who is not only the eternal priest, but also the King of kings and the Lord of lords."

On the other hand, if the Bishops dare make an official publication of the Encyclical, it may cost them their bishopries. Prussia has already proved that she is not at all afraid to remove a Bishop, and everything indicates that the Government is determined to meet this new attempt of the Holy See with terrible earnestness. Surely a sweeping removal of all the Bishops would make the conflict about as acute as one can imagine. But neither the Government nor the Liberal parties will shrink from it on that account, for it is not of their seeking ; and, besides, it is not unlikely that in this manner a satisfactory result will be attained much sooner. Perhaps, also, the Government will forbear once more to apply this heroic remedy, for there are yet several other means left in its hands, as, for instance, the withdrawal of the pecuniary support which the Church at present receives from the State. Nothing will be decided until the Bishops have taken their position in an unmistakable manner. Only this much is certain : the blow will be met with a blow, and neither the Government nor the public is likely to be betrayed into a rash decision. At present they watch and deliberate. The press is discussing some measures of a most incisive character. For instance, it has been proposed to bind all Government officials and the members of the Landtag by an oath of allegiance so plainly worded that, in spite of all Jesuitical skill in interpreting and all mental reservations, no man of any honor could take it who acknowledges and submits to the principles laid down in the Encyclical of February 5. Whether or no such an "iron-clad" oath be required in future, every man whose moral perceptions are not entirely perverted by religious fanaticism has already been placed on the fence, and can no longer put off his decision, whether he incline to the left or to the right. And there is a very large class of honorable men who, thus far, have been able to defer making any decision. They have not liked infallibility, but they have liked still less to break with the Church. So they have chosen the middle ground of keeping their mouths shut, which, under the circumstances, can hardly be judged incompatible with honor, as they were not forced either to make a direct profession of faith with regard to the new dogma or to refuse obedience to the laws of the country. This is no longer possible. They must either treat the solemn decision of the infallible *locum tenens Christi* as "empty wind," or they must cease to be true to their country and to their king. What the choice of the great majority of this class of men will be there cannot be any doubt. The hold of the clergy upon the masses is still very great, and therefore the end of the conflict is probably yet far off ; but the Encyclical of February 5 is certainly the beginning of the end. From this day even the most blindfolded Jesuits will begin to perceive the truth of what Bishop Hefele wrote in November, 1871 : "The new dogma . . . damages the Church in an incalculable manner, so that it has never received a heavier and more deadly blow than on the 18th of July of this year."

The state of the public mind I may illustrate by an interesting little anecdote. One of our best known professors of Roman law, a man of a very mild temper, who has never been heard to advance any extreme opinion, said to me the other day : "When I read the declaration of war by France in 1870, I exclaimed, 'There will be a terrible judgment of God (*Gottesgericht*).' I had exactly the same feeling on reading the Encyclical of February 5." It is very significant that this confidence in a final and complete victory is not in the least abated by the rumors of Bismarck's intentions to put the reins of government into other hands, though these rumors undoubtedly rest on a solid foundation. The final decision of the Chancellor is, however, not expected before the end of the

summer. That until then any decisive result will be attained, of course no one believes ; yet, so far as this question is concerned, no one feels any serious alarm on account of the eventual retirement of Bismarck. Partly this is to be explained by the hope of seeing his health restored by complete rest, so that, if in case of great need he is again called to the helm, he will be found to grasp it with all the strength of his best days. His constitution renders this hope a perfectly reasonable one, and reconciles the people more and more to the likelihood of his yielding at last to the urgent warnings of his physicians. From the possibility of his consenting to be sent into the Reichstag as a simple representative, they derive little consolation, and, I dare say, the judgment of their political instincts is more correct than the deep speculations of the correspondent of the *Kölnische Zeitung*, who first broached this idea, no matter how high his standing and how well informed he may be. The comparison he makes with the English statesmen, the Pitts and Peel, is a very unfortunate one. The Radicals, who are still now and again pleased to call the Reichstag and our Landtags "debating clubs," are hardly more wrong than those who consider the constitutionalism of England and that of Germany the same thing. A well-known general is reported to have said to Bismarck on the battle-field of Sadowa : "If our grenadiers had not conquered to-day, the old women would have hunted you out of the country with their broomsticks" ; and the statesman himself has often acknowledged that at that time he played *va banque*. His whole career since is proof how firmly he is convinced that with us also no government can be strong whose policy is not freely and decidedly supported by the majority of the people. Yet the mainspring of the political power is in what we call the "Government," *i.e.*, the King (Emperor) and his cabinet ; for we are by our historical development, by all our traditions, and by our actual political institutions an eminently monarchical people. Bismarck, as the leader of the majority in the Reichstag, can never play so important a part as the great English statesmen have played as leaders of the opposition minority. Besides, the most prominent feature of his political genius is his daring initiative, for which there is no play in the position of a simple representative. In one word, it is only in the first place that his services are invaluable, and that he cannot be replaced.

But whether I am right in this or not, the state of the public mind with regard to the conflict with Rome is, in the main, not determined by any hopes or fears concerning the resolutions of the Chancellor. Even in the eyes of the plain people with little education, it stands forth as a tremendous struggle of principles, in which victory *cannot* remain with night and darkness, because it cannot be dependent upon the leaders and incidents of the day. The spirit of the Reformation is once more alive—the spirit of the Reformation, not as it appears in Luther fighting his way through the dead wilderness of Roman formalism to the dogma *sola fide*, but the spirit of the Reformation as it appears in the friendship of Ulrich von Hutten and Luther, breaking the chains of Roman despotism, and preaching to princes and peasants alike that there is a political future for Germany too, if she only wills it.

## BOSSUET.

PARIS, March 12.

I HAVE before me a new (anonymous) English life of Bossuet, the Bishop of Meaux.* Cardinal de Bausset wrote a long life of the great orator, "bulky and dry," to use the words of the new biographer. But if you wish to know the real man, you must read the Memoirs and the Journal of the Abbé Le Dieu. I have always considered Bossuet as the greatest prose writer of the seventeenth century, and have taken the greatest interest in all that concerns him. Some of the original copies of his works, I wish I could say all, are on the shelves of my library, and this new biography has surprised me by its accuracy and its exhaustive character.

Bossuet belonged to the strong races of Burgundy, where you find a good mixture of the old Celtic blood of Gaul and of the blood of the German Burgundians, who settled in the east of our country, while the Franks established themselves in the north. He was named Bénigne, from the great saint who has given his name to the cathedral church of the town. His father had a numerous family ; he held a small parliamentary office, and removed to Metz, leaving Bénigne under the care of an uncle, a man of letters, who had a good library. At a very early age the Bible became his favorite study ; during all his lifetime he read it with passion, I may say ; his style has a Biblical boldness and simplicity. He was sent to Paris after the most brilliant classical studies to improve himself in philosophy. Descartes was the new luminary, and Bossuet began to study his works. "I foresee," he wrote to Father Lami, "a great warfare now rising up against the Church under the name of *Philosophie Cartésienne*. I foresee more than one heresy springing from out its bosom, from, to my mind, its misunderstood principles." The Jesuits never liked the Cartesian philosophy, but Bossuet was not the slave of the Jesuits, though he owed to them his education. He became a Gallican ; Gallicanism and Cartesianism went together and were connected by some secret ties which are now hardly perceptible. It is somewhat curious to find that, unlike most Cartesians, Bossuet never liked mathematics or science. In one of his sermons before the King in 1666 he said : "Cultivate science, but do not allow yourselves to become absorbed by it ; do not presume and believe that you are something more than others, because you know the properties and reasons of what is great or small ; empty food for curious and weak spirits, which, after all, leads to nothing which exists."

Bossuet, while he studied at the Collége de Navarre, was introduced to the hôtels of Nevers, Rambouillet, and others. The young theological student saw the *précieuses*, and preached before them ; and Voiture, of course, made his pun, saying that he never heard a man preach so early nor so late. So great became his reputation, that Condé came to attend the debate which took place on the day when he took his degree. Condé remained his friend ever afterwards, as we know from the pathetic tone of the great oration which Bossuet delivered at his funeral ; and the statue of Bossuet will soon be erected in the pleasure-gardens of Chantilly, where the great bishop and the great warrior often strolled together, talking over the great problems of religion and philosophy. At the age of thirteen Bossuet had been made canon of the cathedral of Metz ; after he was ordained, he went to fulfil the duties of his office. He returned soon to the Collége de Navarre, at the beginning of the Fronde, and was amongst the besieged while his patron, the Prince de Condé, Governor of Burgundy, blockaded the capital. He had been named Bursar of the college. In 1652, Bossuet took his doctor's degree, and was appointed archdeacon of Sarrebourg, a small town in Lorraine ; he received priest's orders the same year, after the usual *retraite*, or period of prayer, of meditation, and solitude. The diocese of Metz had been much neglected ; its bishops were absentees, who remained at Court. Bossuet undertook to administer the abandoned diocese ; he left Paris and devoted himself to his duties. Bossuet, remarks our author, does not seem to have had a ritualistic turn of mind. Of course not ; nothing was more grandly severe than the old Gallican church of France ; it had not the austerity of a Puritan church, but it was eminently a serious church. The Romanism of a later period has, to many a good Catholic in France, seemed a corruption. Bossuet was not a man to be amused with flowers, perfumes, and candlesticks. He lived at Metz with two sisters of his and with the Schombergs. His first controversial book was a refutation of Ferry's 'Catechism.' Ferry, the Protestant minister of Metz, had written a big book against the Church of Rome and the doctrine of papal infallibility. Bossuet had, therefore, to treat, at the very first a question which is, perhaps, the most difficult for a devout Catholic: "We only respect the Pope's authority," says he, "because we are convinced that Jesus Christ, our Master, entrusted it to him under strict obligation to render account to himself of its administration. We believe that Jesus has not forsaken his Church, and for that reason alone we believe her to be infallible." The author of the biography cites a phrase of this refutation which seems to me very fine ; it touches on the great question of grace : "Just as man gives sentence by *declaring* the accused to be innocent, so God gives it by *making* him innocent." In Bossuet's doctrine, it is faith which justifies, but good works are the fruit of justification.

The quiet life of Bossuet in Metz was interrupted by the arrival of the Queen with young King Louis XIV., Cardinal Mazarin, and all the Court. He preached before Anne of Austria. In 1658 he was sent to Paris by the Chapter of Metz, and his fame was such already that he was many times asked to preach, and his success is even noticed in Loret's 'Muse Historique,' which is the history of the *grand siècle* in small verse. Preaching seemed for some years to be his only vocation. He left the pulpit, however, on the coming in of 1669, and after that year he rarely preached in Paris, except when he delivered his great funeral orations. I doubt if all Bossuet's sermons have been printed, though there is a collection of them. The Abbé Le Dieu, his intimate, represents him as going for years from parish to parish, Gospel in hand, and finding in the Holy Book an inexhaustible fountain of eloquence. The printed sermons are mere skeletons ; and still, here and there, it seems as if you felt the living ardor of the inspired preacher, and saw his eagle eye, and heard the vibration of his proud voice.

I cannot dwell on every incident of so full a career, and must treat only a few isolated subjects. How came it that Bossuet created a new variety of oratorical speech in his funeral orations ? He was tempted by the grandeur of the subjects he had to treat : how could he make an ordinary sermon with the coffins of Henrietta of England or of Condé before him ? He could

* 'Bossuet and his Contemporaries. By the author of 'A Dominican Artist.'' London : Rivingtons ; New York : Pott, Young & Co.

not read eulogies or biographies either, as people do in the French Academy. His funeral orations are, so to speak, history condensed, magnified, and turned into a great lesson of Christianity. Nothing can approach their sublimity in some parts, and they will remain as the most majestic monuments of the French language, at the time when it had acquired its perfection. The bibliophiles, who may be a little absurd at times, but who have a clear view of what is choicest in art, are now almost frantic for the original edition of the funeral orations; they were printed in quarto in the magnificent large type of the time. I have seen a copy of the Condé oration, which the binder had not yet touched, sold for six hundred francs.

There is a splendid solidity, even in a material sense, in most of Bossuet's works. I have before me, for instance, the 'Discours sur l'Histoire Universelle,' a large quarto volume, and the 'Politique tiré de l'Ecriture Sainte.' What strikes me most when I turn over the pages of these revered old volumes is not only the incomparable beauty of the style, it is the absence of doubt, the strength of the faith which inspired them. We cannot feel as these men did in the seventeenth century. Bossuet believed in his church, in his king, as all men believe that the sun will rise to-morrow. His 'History of the Variations of the Protestant Churches' is simply marvellous in this respect: he feels real pity, almost contempt, for all these poor, struggling, divided, new-born upstart little churches; he celebrates the majestic unity, the antiquity of the Catholic Church; division seems to him the best proof of error. His church is one in which all wills are bent by the will of God. It is a universal union, not a discordant struggle of feeble voices.

How changed our ideal is! We cannot help envying those generations of France which, after the wars of religion, the troubles of the Fronde, gave their whole heart to a glorious monarchy, surrounded with the pomp of art, hallowed by the prayers of men like Bossuet and Massillon, and by the most extraordinary growth of genius. Bossuet has always represented pre-eminently to me what we call the *grand siècle;* he has no doubts like La Bruyère, no hours of revolt such as you can find in many passages of the 'Caractères'; his mind does not wander far away from the orthodox monarchical or theological faith, like that of Fénelon when he wrote his 'Telemachus' or the 'Explication des Maximes des Saints'; he is not in secret revolt against the omnipotence of royalty, like Saint-Simon; he is a pillar of the church and of the state, as hard as granite and as immovable. His controversial powers are terrific; he treats Fénelon, in his 'Relation du Quiétisme,' as a schoolmaster would a child. Many a Protestant writer tried his argumentation against Bossuet, but all in vain. Bossuet is like a living force; his eloquence resembles a strong wind which bends the oaks as well as the poplars. When we read over the history of Madame Guyon, we must confess that she deserved little sympathy, and that Bossuet was right in attacking the morbid sentimentalism which she tried to introduce into the teachings of the church, and which had for a moment deceived the mild Fénelon. Most writers side with Fénelon in this great struggle; the long war of pamphlets between the two bishops has now become tedious. From a Catholic, and one may even say from a Christian, point of view, Bossuet appears to me to have been on the right side in this question; and feeling that he was right and that quietism was a dangerous form of mysticism, he may be excused for having attacked it with some degree of violence.

There was so much vigor in Bossuet that he clung to life instinctively, to the great wonder of the Abbé Le Dieu, who was surprised that constant meditation on the gospels should not have extinguished this sentiment. He went to Paris in his last illness, and spent his last days with Bourdaloue, Père de la Chaise, and others. Can we wonder that during his illness he had his own 'Universal History,' his 'Meditations,' and 'Elevations to God' read to him? He died on the 12th of April, 1704, at the age of seventy-six. The admirers of the great bishop will find in the new English biography a condensation of all the minutest details which are known about him, and which are spread in other works through numerous volumes. The tone of the work is agreeable and not too florid. It is a historical study rather than a panegyric, and, notwithstanding the character of many theological questions, may be read without fatigue.

# Correspondence.

## MALUM AND MALUM.

To the Editor of The Nation:

Sir: In your last number, of March 18 (p. 191), you quote an extract from the London *Academy* of February 29, which is reported by your contributor as saying:

"In his answer to the well-merited castigation which we recently administered to the transatlantic archæologists, Mr. Trumbull actually commits a pun implying the equivalence of mālum and mălum. When will American scholars learn to pay due regard to quantities? Are the members of the Oriental and Philological Societies really any better than the bank-officer of whom we read in the same paper, who, his salary being only $5,000, out of heedlessness of quantity took $50,000?"

It is not quite clear from the above passage what the offence of Mr. Trumbull consists of. If, in committing his pun, he has betrayed "heedlessness of quantity," it must be left to him to meet so grave a charge against himself and the wholesale rebuke administered to American scholars. If, however, he has merely been guilty of a play upon two Latin words which, though they sound alike, differ in quantity, I beg to interpose and respectfully express my dissent from the assertion that such play is not fair play.

It is in itself quite improbable that the Romans, with their conscious deficiency of native wit and humor, should have carefully restricted their propensity for punning, and confined themselves to such words as would come strictly within the accepted definitions of *Antanaclasis* and *Paronomasia.* The latter is defined by Cicero (de Orat., ii. 63, conf. Quintil. Inst., 6, 3, 53) as "*parva verbi immutatio, in litera posita,*" involving, therefore, a slight change in the sound of the word, whereas the former implies the use of the same word in another sense (*contraria significatio*, Quint. 9, 3, 68). The well-known play of Terence on the words *amans* and *amens,** that of Plautus on *fel* and *mel,*† and the many instances of cheap and usually far-fetched wit which we find in Cicero (cf. in Verr., iv. 5, 10) are specimens of the one class of puns; the often-quoted *Sustulit hic matrem, sustulit ille patrem,*‡ furnishes a good illustration of the other class.

It is difficult to conceive of any valid reason why the use of words that are written and sound alike, and differ only in the quantity of one syllable, should not legitimately come under the one or the other of the above definitions. It is surely not necessary to consider the words mālum and mălum as perfectly "equivalent" in order to make them the peg to hang a pun upon. The fact that a similarity of sound exists is as sufficient a warrant for making a Latin pun as it is for making a French calembour; and we cannot doubt that Cicero would have perpetrated his pun on *amari*§ with the same gusto if the quantity of the first syllables of *ămo* and *ămarus* had not been alike.

Indeed, many passages like the line of Propertius‖ in which a pun on *mŏra* and *amōre* occurs, could be cited, and, to come to the point, Heineccius, in commenting upon the "elegantissima anaclasis" of Cicero (ad Attic., epist. xiv. 14) on the word *brutorum,*¶ expressly remarks: "*Ita eodem exemplo dixeris*: 'MALIS *me onerās, haud* MALIS'"; and in another place (Fund. Stili Cult., p. 69), in speaking of paroemia, we read: "*Sic si quis de Hannibale diceret: 'Omnibus* MALIS *Punicis inest granum putre' argutissime hoc esset dictum, cum ob aequivocationem* MALIS *tum ob paroemiam.*"

It does seem as though "the *Academy* had spent its strength mainly in finding something to carp at." As for Mr. Trumbull, I presume he will content himself with that species of contest which Florus (Hist., ii. 6) characterizes as a "*nova de Hannibale victoria*—Nolle pugnare."**

F. H.

Stockbridge, Mass., March 23, 1875.

---

[When the history of the Latin Pun is written, it will be instructive in many ways. Years ago W. A. Becker called attention to the literary-historical importance of the pun. How little or how much Plautus altered his Greek originals cannot, in the absence of those originals, be made out. We must be grateful, therefore, for even the slender evidence afforded by the puns, which in most cases cannot have been translated from the Greek. The phonetic range of the Latin pun was immense. Not much evidence for sounding *c*, the Latin *k*, as *s*, can be deduced from the pun on "Amphitruonis Sōsiam" and "Amphitruonis sŏcium" (Plaut., Amph. 383), or from the pun on *servos* and *cervos*, which may be implied in the Poenulus, III. 1, 20, sqq. As to overriding quantity, "every schoolboy knows," as Macaulay would say, Nero's joke about the dead Claudius, "morari eum desisse inter homines producta prima syllaba

* "Inceptio haec est amentium, non amantium."—Ter. Andr. 1, 3.
† "Amor et melle et felle fecundissimus."
‡ "Quis negat Aeneae natum de stirpe Neronem?
Sustulit hic matrem, sustulit ille patrem."—Suet. Nero, 39.
§ "Amari jucundum est, si curetur, ne quid insit amari."
‖ "Tu levis in nullo quaeris amōre mŏram."
¶ "Quid ergo? ista culpa Brutorum? minime illorum quidem, sed aliorum brutorum."—Cf. Heineccius, l.c. p. 98.
** Novam de Hannibale victoriam commentus est Fabius, nolle pugnare."

iocabatur"; that is, "Claudius had ceased to play the dizzard" (mōrari, μωραίνειν), for he "had ceased to tarry among men" (mŏrari); and the pages of Plautus swarm with illustrations of this point. Our correspondent says "we cannot doubt that Cicero" [or Cornificius?] "would have perpetrated his pun on *amari* with the same gusto if the quantity of the first syllables of *ămo* and *ămarus* had not been alike." We have our doubts, by the way, whether this pun is really Cicero's. Like many other of his good things, we think it is borrowed from somebody else, or at any rate based on the old "amor amari dat tamen quod aegrest satis." But that a Roman would not have stuck at a pun between ămari and a conceivable āmari can be demonstrated by an example where the difference in quantity is greater. A lover, disguised by a patch over his eye, is asked: "What has become of your eye?" "My eye? Oh! my eye is all right." "Yes, but I mean the left one." "I'll tell you:

"'Maris caussa hercle istoc ego oculo utor minus.
Nam si apstinuissem a mare, eo tamquam hoc uterer.'"

Here we have a pun on *ā mărе*, "from the sea," and *ămāre*, "to love," which it passes our ingenuity to do into English. A German, W. A. B. Herzberg, *audax omnia perpeti*, has essayed it in German:

"Hätt' ich dem lieben Meer en'sagen können."

Which may be read:

"Hätt' ich dem Lieben mehr entsagen können."

Finally, if Mr. Trumbull has really got into any serious trouble by venturing a pun on *mīlum* and *mĭlum*, he can be helped out of that with very little ado. It was Charles James Fox, we think, speaking without book, who was fond of putting the two lines of Virgil together:

"Malo me Galatea petit, lasciva puella:
Tu ne cede malis, sed contra audentior ito."

But we do not propose to convince Englishmen even with an Englishman's joke. We cite a higher authority, a man whose right to joke on the subject is unquestioned—Titus Maccius Plautus (Amph. 721):

ALCUMENA. Verum tu *mălum magnum* habebis, si hic suum officium facit.
Ob istuc omen, ominator, *capies quod te condecet.*
SOSIA. Enimvero praegnati oportet mulieri *mălum* dari,
*Ut quod obrodat sit*, animo si male esse occeperit.

It should be explained for those who, like "F. H.," have been misled by the above supposed extract from the *Academy*, that it reproduces the spirit and not the exact words of that paper. Mr. Trumbull was rebuked, schoolmaster fashion, for a want of "prosodial accuracy" in making such a pun.—ED. NATION.]

# Notes.

ROBERTS BROS. publish this month Hamerton's 'Harry Blount,' passages in a boy's life on land and sea; Sarah Tytler's 'Musical Composers and their Works'; R. St. John Tyrwhitt's letters and studies on landscape art, entitled 'Our Sketching Club'; and a single domestic production, a 'Paragraph History of the United States,' by Edward Abbott, a son of Jacob Abbott, and one of the editors of the Boston *Congregationalist*.

——The excellent address delivered in Carpenters' Hall, Philadelphia, on the hundredth anniversary of the Congress of 1774, by Mr. Henry Armitt Brown, has been privately printed in a handsome manner with notes and references. An interesting centennial anniversary in the same city is announced for the 14th instant, that, namely, of the founding of the "Pennsylvania Society for Promoting the Abolition of Slavery, the Relief of Free Negroes unlawfully held in Bondage, and for Improving the Condition of the African Race." This society, which was originally designed to prevent the kidnapping and enslavement of free negroes, was reconstituted in April, 1787, when Benjamin Franklin was elected president. It was the parent of all the anti-slavery societies in this country, and still exists, applying its funds to educational purposes, especially to freedmen's schools at the South. Dr. William Elder will be the orator of the occasion.——We learn from the *Academy* that a new monthly chronicle of current history, *Die Zeitgeschichte*, edited by Dr. Martin Waldeck, has begun to be published at Berlin. The politics of the United States as well as of each European state are embraced in the scheme of this useful periodical.

—A very useful volume has just been issued in the "Clarendon Press" Series—'Fragments and Specimens of Early Latin,' edited by Mr. John Wordsworth. It is a thick octavo, and contains an elaborate grammatical introduction, followed by copious selections, first from inscriptions, second from authors. The term "Early Latin" is defined as embracing the whole period of the Republic, but, of course, the standard and familiar authors who fall within this period are almost entirely excluded. On the other hand, there are abundant specimens of Cato and Varro, as well as of the fragments of the poets, historians, and orators of the Republic. The chief value of the work will, however, we think—at least for American use—be found in the inscriptions, to which we have so little access in this country. Besides specimens of sepulchral inscriptions, vases, coins, etc., we have here collected several of the documents which are not commonly referred to—The Song of the Fratres Arvales, the Senatus-Consultum De Bacchanalibus, the Lex Acilia Repetundarum, the so-called Lex Thoria, the Lex Julia Municipalis, all the extant fragments of the Twelve Tables, and, in an Appendix, a number of Pompeian programmes, *graffiti*, etc. The notes follow the text, and are very full and satisfactory.

—It seems a little unaccountable that students of English early constitutional history pay so little attention to the parallelisms in the sister kingdom of Scotland, dismissing it, for the most part, as Mr. Hallam does, with the remark that it "furnishes no authentic historian, nor laws, nor charters" earlier than the twelfth century. Nevertheless, this barren field is not altogether unworthy of cultivation. Mr. Robertson's 'Scotland Under Her Early Kings' and 'Historical Essays' are quite well known; and besides these, a series of lectures upon 'Scotch Legal Antiquities,' published in 1872 by the late Prof. Cosmo Innes of Edinburgh, will furnish more than one hint in elucidation of English institutions. What strikes the reader most forcibly, in the chapter upon Parliament, for instance, is the fact that both kingdoms, although in different degree, were from the earliest times *constitutional* kingdoms. Scotland had no Magna Charta, no Henry II., no Edward I.; and yet it, as well as England, worked its way out of feudalism into the possession of genuine free institutions. The explanation seems to be that the fundamental institutions of the two nations—from the time when Scotland made Teutonic Lothian rather than Celtic Dalriada its political centre—were essentially the same; so that Scotland, although lacking certain important forces in its development, and in spite of its long exposure to French influences, never fell very far short of English liberties. The most significant illustration of this is perhaps to be found in the fact that in both nations the lesser barons did not unite with the higher nobility to form a powerful political aristocracy, which crushed out all democratic life, as in the nations of the Continent, but affiliated rather with the representatives of the boroughs, and are reckoned, with them, in Parliament, as composing the Commons.

—An interesting article on William Blake is contributed to the last *Atlantic* by Mr. T. S. Perry, apropos of Rossetti's edition of his poems and Mr. C. E. Norton's edition of the Job. It brings out very distinctly the difference between what Blake could do, or perhaps we should say might have done, in the way of poetry, and what he actually did accomplish. Early in life Blake carefully cultivated the poetical style of the great English poetic period, as may be seen in the following quaint piece of imitation:

"My silks and fine array,
My smiles and languished air,
By love are driven away;
And mournful, lean Despair
Brings me yew to deck my grave.
Such end true lovers have.

"His face is as fair as heaven
When springing buds unfold:
Oh! why to him was 't given,
Whose heart is wintry cold?
His breast is love's all-worshipped tomb,
Where all love's pilgrims come.

"Bring me an axe and spade,
Bring me a winding-sheet;
When I my grave have made,
Let winds and tempests beat:
Then down I'll lie, as cold as clay.
True love doth pass away!"

This fact explains, in a measure, his copious vocabulary, and at the same time suggests an origin natural enough for many of his peculiar turns of expression. Blake will probably always be a critics' poet, for he was, speaking after the manner of the flesh, too reckless of his public; and it is a curious sort of revenge of fate upon him that this over-simple, childlike, innocent man, visionary or mystic, should have now fallen a prey to Mr. Swinburne, who has undertaken to explain his less intelligible and sane words as being in the nature of progress-

sive essays of a communistic reformer of some sort. "Part of the joy Mr. Swinburne feels at flying in the face of 'Philistia' is made over by him to Blake, who was probably unconscious of the heresy which was to be ascribed to him in these later days. Blake's occasional enthusiastic overtoppling of social walls bears much more resemblance to the wanton thoughtlessness of a child than it does to the disgust of a man who takes hold of the world in a way sure to produce satiety, or to the scorn of one who has carefully weighed the world as it is and the world as he would have it, and who has then taken the side of those who wish to remodel it."

—The *Atlantic* and *Scribner's* for April both contain articles from the fertile pen of Mr. G. E. Waring, that in the *Atlantic* giving an amusing account of some Southern cavalry service during the Rebellion, and of a horse which, from his owner's account, must have been a fine beast; and the true version of the end of the battle of Pontotoc, in Northeastern Mississippi, described by the rebel general Forrest as "a cavalry charge of the enemy, which was repulsed," but by Mr. Waring as a cavalry charge of the *Vierte Missouri*, which, though brought up by a staked and ridered rail fence, not previously taken into account by the commanding officer, nevertheless dispersed the rebel foe. In *Scribner's*, Mr. Waring gives an account of a "farmer's vacation" in Holland—an interesting article with capital illustrations. Hardly worth printing, we should say, are the dozen pages given up to the "Liverpool of America" (Baltimore). We must also enter a *caveat* with regard to the article on the "Shakspere-Bacon Controversy," as it is entitled, for it is unfair to call that a controversy which is entirely carried on by one person. Judge Holmes of Missouri is, we believe, the only person living who really believes either that Shakspere wrote Bacon or that Bacon wrote Shakspere; and until he brings forward some more direct evidence than that Miss Delia Bacon believed that if Shakspere's grave could be opened, evidence of Bacon's authorship would be found, we can hardly expect the controversy to get very violent. It is announced, by the way, that Mr. Holmes is about to issue a new edition of his remarkable work, containing new and important evidence, and we therefore take this opportunity of pointing out that the theory that the writer of Shakspere must have been a profound lawyer does not point to Bacon, for Bacon was not a profound lawyer at all; Queen Elizabeth, at least, who must have known if anybody did, is quoted, in Macaulay's essay on Bacon, as saying: "Bacon hath a great wit and much learning; but in law showeth to the utmost of his knowledge, and is not deep." We trust Mr. Holmes will not overlook this point in his new edition, for, on the theory referred to, it seems to show that some third person, perhaps Coke, had a hand in the plays.

—The statistics of crime in the city of New York are difficult of access, and, when obtained, frequently unreliable. The only officials, so far as we know, charged with the duty of collecting criminal statistics, are the Board of Police Justices, who, under the new city charter, are obliged to make annual reports. The first report of the present Board, recently published, is therefore a document of a good deal of interest, though deprived of much of the value it ought to possess by the absence of all previous records. The value these reports might have may be guessed at when we reflect that these New York police justices—whose courts possess and exercise nearly the whole summary jurisdiction in this population of a million souls—have ceased to be a political body, have a ten years' term of office, depend no longer upon the favor of the criminal classes for their appointments, and have at once better opportunities of observation and greater inducements to the faithful performance of their duty than formerly. We have therefore looked with much interest through this report to see what the police justices have to say on the subject of a practice which (though as a social custom it is rarely talked about at all) every few years leads to acts that attract a great deal of attention—we mean the practice of carrying concealed weapons. In the *Nation* of June 19, 1873, we discussed this subject, apropos of the new murder law then recently passed by the Legislature of this State, and maintained that the only way in which the use of deadly weapons could be effectively checked was the enactment of a law making the carrying of concealed arms a presumptive evidence of intent to use them. We find now that the police judges have been brought, by actual experience and observation of the results of the practice, to the same conclusion which we reached. They say:

"There seems to exist no sound reason why the law which applies to the carrying of slungshots should not apply to the carrying of pistols. Any person found in possession of a slungshot, with intent to use the same against another, is declared to be guilty of a felony; and the mere possession of the instrument, concealed on the person, is declared to be presumptive evidence of such intent. The operation of this law, although of comparatively recent enactment, has been very beneficial, and has caused a marked diminution in the use of this weapon. It is submitted whether an enactment in a similar spirit regarding firearms would not have a like beneficial effect."

—The Baltimore *American* mentions, among the considerations which should govern the trustees in determining the character of the Hopkins University, the probability that the testator, being himself a shrewd and successful business man, intended that his university should be of commercial advantage to Baltimore, and that therefore they ought not to adopt any plan which seems likely to keep down the number of students who will resort to it. If they should take this view of the matter, and decide to make it a thoroughly popular institution which will bring plenty of custom to the Baltimore stores and boarding-houses, we trust they will not overlook the value of chromos in drawing it, and will offer them freely either to every student entering or every student graduating. Our religious contemporaries, whom it would be well to consult on the matter, have had ample experience of their value; and if we may judge from statements of theirs which we have read, it is possible to obtain thirty good chromos from the manufacturer, if you take them wholesale, for the price at which one can be bought at retail. We doubt if Maryland is yet familiar with these delightful works of art, and we have little doubt that hundreds of families would probably send their boys to college for the sake of drawing the pictures. A chromo and a degree would in fact be a temptation which even the poorest could not resist. Up here, it is true, we can do better, for we can get a chromo, a weekly paper, and a strong chance for eternal salvation for less than four dollars a year; but Maryland must not expect to enjoy such advantages within ten years after the abolition of slavery. It might be a question whether the Produce Exchange in Baltimore would not supply the chromos. In fact, the subject will bear much turning over.

—Those of our readers who are interested in the drama will thank us for calling their attention to a work on this subject which is remarkable in many respects, and which bids fair to be one of the most voluminous books of the day. The title is 'Geschichte des Drama's,' by J. L. Klein (Leipzig: T. O. Weigel, 1865–1874, 11 vols. 8vo). It is still in course of publication, the first part of the eleventh volume having just been received. Klein's design is no less than to give a general history of the drama of all times and peoples. What progress he has made, and what enormous proportions his work must assume, may be seen from the following sketch of the contents of the volumes so far published. Volumes I. and II., 1865, contain the introduction and history of the Greek and Roman drama; Volume III., 1866, the non-European drama, and Latin plays from the first to the tenth century, the former including the Indian, Chinese, and Japanese drama, as well as that of the Incas and Aztecs; Volumes IV., V., VI. 1, 2, VII., 1866–1869, the Italian drama; Volumes VIII. to XI. 1, 1871–1874, the Spanish drama down to and partly including Calderon. These volumes average more than seven hundred pages. It is difficult to characterize the work as anything but an enormous, ill-digested mass of valuable material, which owes its overgrown proportions to the author's passion for giving interminable analyses of works under examination—a proceeding, we may safely say, unequalled in the whole range of literary history, and disastrous to the scientific as well as to the popular character of the book. His style, though often bombastic, is attractive, and he is unsparing in his criticisms both of the dead and the living. Some of his attacks are very amusing, as for instance in the sixth volume, where he devotes thirty pages to demolishing Professors Vallauri of Milan, and Ritschl of Leipzig, who dared to object to his treatment of Plautus. He introduces his critics in a dialogue in which they are made to converse in Italian and Latin, and dismissed with Ritschl exclaiming: *Sum satis verberatus, obsecro.* It is a matter of some curiosity as to what the length of Klein's completed work will be. Giving him two more volumes (the second part of the eleventh will only finish Calderon) for the Spanish, and four each for the English, French, German, and other North European dramas, we shall have the respectable number of thirty volumes, which may be increased indefinitely. We see the *Saturday Review* is already beginning to pun on the author's name, which, considering the length of his work, it pronounces a misnomer.

—Students of human anatomy will be glad to hear of the completion of Heitzmann's 'Atlas of Descriptive and Topographical Anatomy.' The sixth part, containing the vascular system, has recently appeared. This work, suggested by the engravings of 'Gray's Anatomy,' and intended to accompany Hyrtl's excellent text-book, has been appearing in parts since 1870. It offers the student a convenient atlas and just enough text to be very useful when reviewing or "cramming," even for those who do not read German readily. Of the six hundred engravings, about fifty are from other authors, most of the remainder being from Heitzmann's own drawings on wood, after preparations made in Vienna. The typographical

execution is admirable, and the details of a macroscopic anatomy are given as clearly as is possible without the use of colors or of the higher arts of the engraver. The publishing price of the six parts, which may be had separately, is fifteen (Austrian) florins—about seven and a half dollars. Another very handy anatomical atlas is that containing the illustrations from Henle's 'Handbuch der systematischen Anatomie.' The second edition of this atlas is also appearing in parts, four of which are already in the market (New York : L. W. Schmidt). Typographically, they are much inferior to their Vienna prototypes, and contain no text, but they cost about one-half less. The coloring of Part III. (myology), very like that of the 'Traité d'Anatomie descriptive' of Cruveilhier and Sée, renders it a very convenient aid to the practical dissecter. Part IV. (augiology) is not bad, but, despite the coloring, we prefer Heitzmann, which the student can color for himself with advantage. English-speaking students of histology are to be congratulated on the appearance of an English translation of Heinrich Frey's valuable manual on the 'Histology and Histochemistry of Man.' (New York : D. Appleton & Co.) Being the work of a single skilful investigator, it is more uniform in its character and better adapted to the wants of beginners than the somewhat more exhaustive and rather too composite handbook of Stricker. The translation reads very smoothly, and the excellences of the original work seem to be well reproduced.

—Late Athens papers record the death of George Finlay on the 26th of January. He was a Scotch Philhellene, who remained in Greece and became a painstaking student of her antiquities and mediæval history. His larger works are 'Greece under the Romans,' and histories of the Byzantine Empire and of Mediæval Greece (1204–1461 A.D.) and the Empire of Trebizond. Besides publishing brief essays on a variety of subjects, he had for years been a regular correspondent of the London *Times*, and had incurred some odium in the land of his adoption by the freedom—not to say severity—of his criticisms on the present generation of Greeks. The relics of prehistoric Greece, or Greece of the stone age, interested Mr. Finlay in his later years. Having collected thirty-two pieces, he published a description of them in 1869, and circulated it widely not only in the present kingdom but in Thessaly and Epirus and other regions beyond. He appealed to school-teachers especially to search for further remains, and he was thus enabled to increase his own collection to more than four hundred specimens. ——Schliemann's Trojan discoveries are still discussed in the Athens journals. Nikolaïdes adheres to his first love, and claims Bunarbashi as the site of Homer's Ilion, in reply to Prof. Burnouf of the French school, who supports the city that has been uncovered on Hissarlik. The Germans have established a school at Athens, apparently on the pattern of the long-existing French school, to which a few young scholars are sent from the mother-country to study under the direction of an eminent archæologist. The inauguration took place at the beginning of winter, at which the director, Otto Luders, made an address on archæology, and Prof. Philippos Ioannou of the University, who has pleasant memories of his residence in Germany, spoke of the services which that country had rendered to Greece. Among the dignitaries present were the Minister of Public Instruction and the ambassadors of Germany and Austria.——The Austrian explorers in Samothrace have succeeded in reconstructing the plan of two beautiful temples which were thrown down by an earthquake about the fifteenth century. One was dedicated to Kybele and Dionysos ; the other, of circular form, was erected by Arsinoë of Egypt about 250 B.C. The latter was discovered about ten years ago by two French explorers, who, however, published no description. The Austrians have found a considerable amount of sculpture in the ruins, which they have sent to the Vienna Museum. A full report is promised soon.

## MAINE'S EARLY HISTORY OF INSTITUTIONS.*

NO men have done so much to revive in England the study of jurisprudence as Austin and Maine. But no two writers are a greater contrast, both in style and in spirit.

Austin's stiff, laborious sentences, in which nothing is ever sacrificed to grace or sound, and everything is sacrificed to clearness and precision, have repelled many promising students, but are exactly adapted to attain the aim of a writer whose sole object was, at any cost of labor to himself or his readers, to express his exact meaning, and to force others to understand the very thought which he intended to convey ; nor has his effort been without its appropriate reward. Whoever has once studied in Austin's school will find that certain notions, limited it may be in number, but of immense theoretical importance, have been permanently impressed on his mind. The nature of "law," the definition of "sovereignty," the distinction between "real" rights and "personal" rights, the elementary terms of legal logic, are explained by Austin with a lucidity and enforced on his readers with a power which make misapprehension or forgetfulness impossible. To have been freed from all mistiness and confusion in respect of the terms which constitute the elements of the logic of law, is the service which Austin's pupils owe to their teacher. Those who are most indebted to his works need have no scruple in confessing that the originality and force of his intellect exceeded its fertility and pliability, and that he and his school approached law almost exclusively from its logical rather than its historical side.

No man of genius can pay a more generous tribute to a teacher of a different stamp of mind from his own than Maine renders to Austin. But the points of contact between the two render the contrast the more marked. The easy grace of Sir Henry Maine's style, his singular aptitude for seizing on the interesting aspects of his subject, the skill with which thoughts are suggested rather than worked out, have attracted to the study of jurisprudence as many students as Austin's ruggedness has repelled. The style, too, in his case, no less than in that of Austin, represents the man. His grace of expression, and the easy flow with which he passes from one interesting topic to another, exactly correspond with the fertility of conception, the ease, so to speak, of thought, and the rapid appreciation of other men's best ideas, which constitute the salient features of his mind. To trace analogies which escape ordinary observation ; to suggest on the slightest hint bold and always ingenious theories ; to apply to the history of law the best historical, scientific, and ethical conceptions of the day ; to point out the limitations under which the rigid theories of writers such as Austin must be admitted, are feats which the author of 'Ancient Law' performs with unrivalled skill and ease. It is as natural that he should survey law from an historical point of view as that Austin should treat it from its logical side. To complain of either for following the natural bent of his genius were futile. In each case it is a matter for congratulation that a writer of singular power should have taken the course best calculated to give his talents full play and extend his influence. That Sir Henry Maine has exerted an extremely wide influence on English legal speculation no one competent to form a judgment can doubt. His first work greatly stimulated, if it did not create, a study of Roman law. His last will, it may be hoped, give a similar impulse to investigations into comparative law, and especially into the legal institutions of India.

The 'Lectures on the Early History of Institutions' are marked by all the characteristics of their author. The annals of Irish law are, it may be suspected, in themselves as dry and crabbed a topic as any subject of real interest can be, and it may well be doubted whether the translations of the ancient laws of Ireland, recently published by the Government, will not rather disappoint students who attempt to peruse them under the enthusiasm kindled by Professor Maine's lectures. But whatever be the character of the documents to which he is mainly indebted for his facts, there is no doubt that the lectures themselves are full of interest. Their charm arises in part from their style, but chiefly from the mass of ingenious suggestions and speculations with which every page is filled. This fertility in new ideas is exactly one of those charms of which it is almost impossible to give any real notion within the limits of a review ; and one or two examples must suffice as mere specimens of Sir Henry Maine's singular and admirable capacity for tracing analogies and forming generalizations. The theory, for example, which connects the Brehons with the Druids is valuable as affording an instructive comparison, whatever may be its worth as a contribution to history ; and the further suggestion that the position of the Brahmins throws light on that of the Brehons is well calculated to point to a line of useful enquiry. It is, in effect, only one example of one of the most remarkable characteristics of the early history of institutions : the constant parallel between ancient Irish and existing Indian institutions. Sir Henry Maine's career has manifestly called his attention to the great importance of bringing together, for the purpose of comparison, the institutions and laws of the East and of the West. But though his position has given him a rare opportunity for illustrating the comparatively modern history of European society by an investigation into the existing institutions of the ancient and stationary societies of the East, his habit of placing the laws of Ireland in constant juxtaposition with the result of investigations into the customs or traditions of India, is merely an application of one of the general theories which he has done as much as any man living to expound and enforce. In all his other works, he has directed attention to the fact that what we call "progress" is limited to a small portion of the human race, and that the mass of the world has, after making a certain advance, remained in a stationary condi-

* 'Lectures on the Early History of Institutions. By Sir Henry Sumner Maine.' London : John Murray ; New York : Henry Holt & Co. 1875.

tion. Hence it follows that the existing institutions of stationary societies often keep alive for examination habits and modes of life which correspond with the habits of early European civilization. It therefore follows that it is probable that ancient Ireland may be illustrated by modern India.

To this idea Sir Henry Maine returns again and again. The Indian family throws light on the Irish sept. The influence of the Brahmins illustrates the influence of the Brehons. An analogy which certainly is extremely striking is discovered between the extraordinary Hindoo custom of "Dharna" and an almost incomprehensible allusion in Irish law to what is called "fasting upon a debtor." That a creditor should, at any time of the world's history, have extorted payment of his debt by threatening to sit down at his debtor's door and there starve himself to death, is strange enough. That the custom should have needed English law to repress it in India is an undoubted fact. That a similar custom once existed in Ireland is a startling theory; and, without knowing something of the texts on which those who maintain it rely, any one must hesitate to affirm positively its truth. Sir Henry Maine, however, has pointed to a most suggestive analogy between Indian custom and the terms of Irish law, and has, moreover, shown that the institution of "fasting upon a debtor" may have been, at one stage of civilization, far from the unintelligible absurdity which it sounds to modern ears. Closely connected with his explanation of the nature of "Dharna" is his whole view of distress and of the history of legal procedure. It is, in fact, to this portion of his last work that we should ourselves point as the most important contribution he has made to the theory of comparative law; but though many persons will be at once startled and interested by the observation "that there is no more ancient institution in the country than the village pound, which is far older than the king's bench, and probably older than the kingdom," the most attractive—the perhaps too attractive—part of Professor Maine's speculations will be found by most readers to be the brilliant generalizations, which present a whole view of history in a few lucid sentences. "The change," for example, he writes, "which took place in France at the first Revolution was this: The land-law of the people superseded the land-law of the nobles. In England the converse process has been gone through, and what has occurred is in harmony with much else in English history. The system of the nobles has become in all essential features the system of the people." "Fewness of ideas," again he lays down, "and slowness of addition to the mental stock, are among the most general characteristics of mankind in its infancy"; and from this doctrine he proceeds, with extraordinary ingenuity, to explain a variety of features in ancient institutions. Another wide inference drawn from the study of Brehon law is that, in some respects, differences of race are, in general, far overrated. Such a study "conveys a stronger impression than ever of a wide separation between the Aryan race and races of other stocks; but it suggests that many—perhaps most—of the differences in kind alleged to exist between Aryan sub-races are really differences merely in degree of development. It is to be hoped the contemporary thought will before long make an effort to emancipate itself from those habits of levity in adopting theories of race which it seems to have contracted. Many of these theories appear to have little merit except the facility which they give for building on them inferences tremendously out of proportion to the labor which they cost the builder."

Each of these reflections is full of interest, and scores as interesting might be culled from Professor Maine's works. Each of those we have cited is in our judgment true, and the last is an observation of immense importance which modern theorists, as well as modern politicians, cannot lay too much to heart, and the only question it suggests is whether its spirit is not wider and truer than its terms. Non-Aryan races are after all human beings, and further investigation may perhaps diminish our opinion of the difference between even the larger divisions of mankind. Sir Henry Maine's generalizations exhibit the weak no less than the strong side of his intellect. In the power of tracing analogies between different institutions, in the capacity for seeing the bearing of obscure and neglected facts, he surpasses any living writer. The fertility, however, and resource of his imagination are apt to lead to the construction of theories which, though useful as suggestions, cannot be said to rest on a wide basis of ascertained fact. In many instances, he may have collected information which fully supports his conclusions; but the unfortunate habit of hardly ever referring to his authorities renders it impossible to distinguish in his writings the realm of fact from the domain of theory. What, for example, is the proof that anything like the *patria potestas* existed in any other race than among the Romans? How far can we safely press what Professor Maine happily terms "ancient dramatization?" Can it, that is to say, be assumed that the dramatic element in early forms of action is always the representation of what at one time was literal fact? Is the likeness between the Brehons and the Druids to be considered merely accidental, or are we to search for an historical connection? Is there any real connection between any tenure known to Roman law and the feudal system? Is it at all certain that the expressions to be found in Irish law as to "fasting upon a debtor" have been rightly interpreted, or that the texts are sufficient to support any certain theory with reference to the habit to which they relate? These and a hundred other enquiries thrust themselves on any intelligent reader either of 'Ancient Law' or of 'The Early History of Institutions.' We do not for a moment undertake to answer these questions. What we do assert is, that Professor Maine does not provide the means for their decisive answer. The facility of his style, his masterly handling of his subject, conceal from his delighted readers the immense amount of hypothesis which underlies even the best ascertained of his theories, and a doubt suggests itself whether his ingenuity in providing solutions for the problems of legal history does not occasionally lead him to confound a plausible hypothesis with a certain fact. The turn of his mind inevitably makes him look at law from its historical side. Of this in itself there is no reason to complain; but it renders him a not quite satisfactory critic of writers who, like Austin, treated law logically. Hence the last chapters of Professor Maine's work, which are in effect a critique on Austin, though full of interesting suggestions, are the least satisfactory part of his work. To complain, for example, that Austin does not deal with the question of "sovereignty" historically is to fall into the error, which at the present time is common enough, of confounding the province of history and of logic. It seems not unlike asserting that Ricardo ought to have connected the theory of rent with a history of tenure. The truth is that the relation between Ricardo and later writers on political economy has a distinct resemblance to the relation between Austin and his critic. The older economists, of whom Ricardo may be taken as a type, traced out the principles of their science in a hard, precise, and dogmatic form. It has been the work of later speculators, such as Mill, to press on public attention the modifications and limitations to which the doctrines of their predecessors are liable when applied to life or history. This is the spirit in which Sir Henry Maine deals with Austin. He accepts that great jurist's fundamental ideas, but he urges that Austin's conceptions can be taken as true only within certain limitations and subject to considerable reservation. Unfortunately, the stress laid on these limitations is so great that many readers, we suspect, may begin to doubt the value of the conceptions themselves. To produce this result is undoubtedly not the intention of Austin's critic, but it is the effect of the indirect historical form of criticism in which Maine excels. Austin's logical system should be grappled with logically. The critique on Austin shows the weakness just as the rest of the lectures exhibit the strong side of the historical method of which Maine is the greatest living master.

## RECENT WORKS ON ENGLISH HISTORY.*

NUMBERLESS are the histories of England, and yet until now it has been difficult to select any one from the number as really and thoroughly satisfactory. This difficulty exists no longer. We will not go so far as to pronounce Mr. Green's book faultless, but we will say without hesitation that it is almost a model of what such a book should be—so far above any other brief and complete history of England that there is no room for comparison. It is first of all a history of the English people. "I have," he says, "devoted more space to Chaucer than to Cressy, to Caxton than to the petty strife of Yorkist and Lancastrian, to the poor-law of Elizabeth than to her victory at Cadiz, to the Methodist revival than to the escape of the Young Pretender." At the same time, he has not forgotten that the king and nobility are a part of the people, and has by no means neglected the matters that form the stock of most histories. Nor, on the other hand, has he lumbered his pages with tiresome details of social life—as tiresome and unedifying, in the way they are usually introduced, as the dry details of political and military history; but whenever such facts are

'An Introduction to the Study of Early English History. By John Pym Yeatman of Lincoln's Inn, Esquire, Barrister-at-Law, author of 'The History of the Common Law of Great Britain and Gaul,' 'An Outline of the Practice of the Mayor's Court of London,' etc. "Magna est Veritas et prevalebit."' London: Longmans, Green & Co. 1874. 12mo, pp. 352.

'British Ethnology. The Pedigree of the British People: An Argument, Historical and Scientific, on the Origin and Growth of the Nation; tracing Race-Admixture in Britain from the Earliest Times, with Especial Reference to the Incorporation of the Celtic Aborigines. By Thomas Nicholas, M.A., Ph.D., F.G.S., [Third Edition.]' London: Longmans, Green & Co. 1873. 8vo, pp. xiii. and 567.

introduced, it is in their relation to the national development. A striking example of this is found in the sketch of English society in the reign of Queen Elizabeth (p. 388), every point of which is connected directly with the wonderful impulse given at that time to the national growth. The book is, therefore, in truth a history of civilization, but civilization regarded in a concrete point of view. Society is not treated, after Mr. Buckle's fashion, as growing like a plant wholly from an internal development, but all the forces which act upon it, as well without as within, are carefully and adequately analyzed. The characters of leaders are remarkably well described, and their respective influence upon history fairly and appreciatively judged. And the author has shown rare tact and discrimination in the selection of his facts, so that the reader never feels himself to be put off with commonplace generalities, but to be always standing on the firm ground of ascertained and systematized knowledge, while at the same time every line is interesting reading.

Although in a certain sense a compendium, this book is fully up to the most recent scholarship ; its author, if not an original investigator himself, knows at any rate what historical proof is. In early history, he is of the same school as Mr. Freeman, although not an unquestioning follower of his ; as, for example, he is far more moderate in his championship of Godwine and Harold. One feature of Mr. Freeman's view, indeed, Mr. Green pushes altogether too far—the extensive use of the term English. He will have it that the Jutes and Saxons, before the migration, were all embraced under the name "English"—surely an opinion rather the converse of the truth ; for it is well established that the Angles migrated in a body, the name disappearing for ever from the territory which they had occupied ; while Jutes and Saxons continued permanently in their old haunts. In like manner, he gives without question (p. 56) Mr. Freeman's view of the Witenagemot, as a development of the mark-moot and shire-moot—a view which is rejected, and seemingly with right, by Prof. Stubbs. We are not sure that in his arrangement Mr. Green does not carry too far his peculiar method of discussing the history of the people rather than of the court. His division into chapters pays very little regard to reigns and dynasties, being grounded upon the great epochs in the life of the community. But perhaps it might be said that the history of the nation is even better worth telling than that of the people ; and the national life depends a good deal upon the old familiar division of periods. This method leads to some slight discrepancies. For example, Chap. IV., "The Three Edwards," is followed by Chap. V., "The Hundred Years' War." Now, the reign of the third Edward falls almost wholly within the range of this topic, while the closing scene of the war—Joan of Arc—is relegated to Chap. VI. This cannot fail to create some confusion. His plan even leads him at times to disregard chronological connection altogether, in order to secure a better logical arrangement ; for instance, Lord Bacon is introduced (p. 591) in connection with the scientific development of the period of the Revolution of 1688 rather than with the age in which he lived. For this reason, we do not feel satisfied with the Table of Contents. The present generation has learned the value of indices, and the book before us is provided with a very excellent one ; but it is equally important to have a copious table of contents, such as Mr. Freeman always gives. The peculiarities of Mr. Green's arrangement, joined with the meagreness of the table of contents, make it difficult to know where to look for the detailed treatment of any subject which is narrower than the heading of a section and broader than an index topic.

American affairs are very well treated ; but both in the map (p. 491) and in the text the New England colonies are considered as identical with the present States ; only the three colonies of Massachusetts, Connecticut, and Rhode Island are given in the map for 1640. Again, it is stated (p. 739) that an "established church" was impossible in the American colonies. Now, the Congregational Church was "established" in New England and the Episcopal in the Southern colonies. Another error is in regard to the colonial governments, in all of which it is said that the Governor was appointed by the Crown ; but Connecticut and Rhode Island elected their own governors until the Revolution, while Pennsylvania and Maryland continued under proprietary rule until the same time.

We notice the following slight errors or misprints : The descent of Julius Cæsar upon Britain is placed (p. 5) in B.C. 54 instead of 55 ; the first king of the House of Valois is called (p. 219) Charles instead of Philip ; the mother of Charles IX. is called (p. 404) Mary instead of Catharine of Medicis ; the Peace of Paris is placed (p. 743) in 1772 instead of 1763 ; the period from the Duke of Grafton's administration (1768) to the close of the American War is reckoned (p. 749) at eight years. There are excellent genealogical tables, five maps (partly from Mr. Freeman), and a very copious chronological table from Miss Thompson. The present edition contains no special references, but carefully prepared and valuable general lists of authorit at the head of each section. In these Mr. Green has confined himself to English and a few leading French authorities. This is no doubt judicious, but we think it would have been well to make an exception in the case of so recent and important a work, and so specially interesting to English students, as Lechler's 'Life of Wiclif.' The book is well printed, but we must protest against the practice of the Messrs. Macmillan of cutting the edges of some of their books to the quick ; this book, like Stubbs's 'Constitutional History,' is seriously injured by the narrowness of the margin.

There is no better way of testing the special merits of a book than by comparing it with another in the same field ; and the fourth of the "Epochs of History" Series, 'The Houses of Lancaster and York,' covers partly the same ground with Mr. Green's history. Mr. Gairdner's strength is just such as to complement Mr. Green's work. His history is almost purely dynastic ; very little attention relatively is paid to the social and literary history of the period. On the other hand, the political history is very full, and the complicated intrigues of these most puzzling years are unravelled probably as completely as is now possible. Mr. Green gives a far more lively picture, for instance, of the King-maker, and shows the general bearings of the Revolution of 1461 with greater force. There was no great principle dividing the parties, neither were the hereditary claims of any material weight in the contest ; but "the persecution of the Lollards, the disfranchisement of the voter, the interference with elections, the odium of the war, the sham of the long misgovernment, told fatally against the weak and imbecile king, whose reign had been a long battle of contending factions" (p. 277). It was a protest against misgovernment—like the political revolution of last fall—and was followed by the reaction of 1485, when it was found that the misgovernment of the new House was almost as gross as that of the old. On the other hand, Mr. Gairdner points out, what Mr. Green does not, that the quarrel between Edward IV. and Warwick as to the French or Burgundian alliances was not on an empty point. The Burgundian alliance was "greatly to the satisfaction of the king and of the people generally, especially of the London merchants, who traded with the duke's subjects in Flanders" (p. 185). It was a natural outgrowth of the industrial development of more than a hundred years.

It may be worth while here to call attention to a recent German monograph coming within the scope of this work. Dr. Lenz's object is to ascertain the causes which led the Emperor Sigismund to exchange the hereditary alliance of his family with France for one with England, and to trace the results of this alliance. The causes of the Treaty of Canterbury he finds (p. 57) chiefly in a desire to get back the provinces of the old kingdom of Burgundy, which had come into the possession of France. For this object he agreed to join Henry V. in active hostilities against France. This, however, came to naught—Sigismund's hands were too full elsewhere—and the sole practical result of the alliance was in its influence upon the Council then sitting at Constance. The great war between England and France threw its shadow upon the deliberations of the Council, and was carried on as fiercely there as in the field. France, under the lead of Gerson and D'Ailly, had taken the lead in the efforts for reform ; and it was clear that any efficient reform must be accomplished before the vacancy in the Papacy was filled. But France was now thrown into the arms of the party of the Curia, so that she was united with the Italians and Spaniards against reform. Even the zeal of the Teutonic nations now flagged, and the compromise was soon effected by which Cardinal Colonne was elected Pope (Martin V.). All further plans of reform were now postponed until the Greek Kalends.

Mr. Yeatman's views upon early English history are briefly as follows : "That Mercia and East Anglia, long before the days of the Romans, were a great confederation of Ligurian [=Llogrian] people, who were divided on the north by the Humber and Mersey from a confederation of their neighbors the Umbrians, and upon the south by the Thames and the Bristol Channel from the West Angles" (p. 198); that "the Angles were the people who called themselves Llogrians" (p. 43); and "that the Angles were Celtae" (p. 38); that "Eastsex, Midsex, and Sussex comprised the whole dominions ever occupied by Saxons," the name Wessex being "a modern forgery" (p. 21) ; that "the Saxons swarmed from every part of the Continent, and necessarily spoke every kind of dialect and language . . . not unlike the lingo invented for purposes of intercourse by the soldiery of any nation" (p. 86) [say pigeon-English] ; that "in the Anglo-Saxon tongue, as it is presented to us, there is a very small proportion of English words, and the bulk of it is damaged Teutonic and Scandinavian, the kind of lingo we should expect to find current among the sea-robbers of the north" (p. 83) ; that "the whole of Saxon literature from beginning to end is a forgery" (p. 258); consequently, that "the fame of Alfred perishes" (p. 319); fur-

ther, that "the whole story of Norman rule in this country is based upon fiction. It began, not with William the Conqueror, as Mr. Freeman pretends, but with the elder Danish kings, his ancestors" (p. 20); Edward the Confessor being "looked upon, not as a restored Saxon, but simply as a son of the famous Princess Emma of Normandy, the wife successively of Ethelred and of the great Canute" (p. 19). We have omitted the "probablys," "doubtlesses," and "unquestionablys" which introduce many of the above passages, and will only say that we have never read a book in which these words entered so lavishly in the premises and were so wholly ignored in the conclusions. These views are reiterated in many and various shapes throughout the book; but the style of argumentation may be fairly judged from the following extract: "It may be asked, what evidence have we of the antiquity of our language? what fragments of it do we possess? We can only answer we possess the language, and that it proves its own antiquity and its own origin: except here and there a word, we must not expect to find much evidence of its earlier existence. That it was the language of the natives, and of their conquerors, the Romans, in the first five centuries after Christ, we know; and we do not know anything for certain in the five centuries which ensued" (p. 68).

Let us now pass to a book in the same general direction, but of a very different type. It is the aim of Dr. Nicholas "to show that a moiety, perhaps the greater part, of the subjects of the early Anglian and Saxon kingdoms must have been of the 'British' race" (p. vi.) This, which covers only a small portion of the vast field embraced by Mr. Yeatman's views, we think the author has satisfactorily made out; and, having regard for the evidence —which is not by any means of a very remote or recondite nature—it is hard to conceive how the theory of extirpation held by Mr. Freeman and Sir Edward Creasy, could have got a foothold. Nevertheless, we cannot think that all Dr. Nicholas's reasoning is sound. He adduces, for example, the desperate resistance made by the Britons, and the consequent slowness of the conquest, as an argument for his view. It seems to us that it tells directly the other way. A rapid conquest, like that of the Franks, was likely to be superficial: a slow and bitterly-resisted conquest is apt to be relentless and thorough. Again, while his reasoning from language, history, and physical characteristics is generally sound and always able, that from institutions is weak; evidently he is not thoroughly familiar with this branch of the subject. He seems entirely ignorant of the fact that Anglo-Saxon laws and institutions have close and intimate relations with those of the Teutonic nations of the Continent, which is a *prima-facie* evidence of community of origin. As an instance, he says that the division of the territory into hundreds and townships was "copied absolutely from the Britons" (p. 306); and a short chapter of nine pages (Chap. IV. of Part III.) is devoted to pointing out a few superficial resemblances between British and English law, to the complete ignoring of the deep and fundamental resemblances in other branches of Teutonic law. The argument would have been stronger without much of this. There are serviceable maps and an index.

---

*Ezra Stiles Gannett*, Unitarian Minister in Boston, 1824–1871. Memoir, by his son, William C. Gannett. (Boston: Roberts Bros. 1875.)—This extremely voluminous memoir deserves attention, not because Dr. Gannett was a man of remarkable force, but because there is something rather strikingly typical both in his character and career and in the execution of the work. Mr. William Gannett has evidently determined to be readable—to make as far as the subject permits a "picturesque" biography. From his own point of view, we should say he had succeeded even brilliantly. His book is elaborate, and yet clear and vivacious, and it comes as near as possible to being an entertaining account of a man whose intellectual character was singularly monotonous and colorless. Considering that it is written from the filial standpoint, it is even curiously candid and impartial; it seems to us, in fact, to carry contemplative frankness to rather painful lengths. If we call such a work, written in such a way, typical, it is not that we find it easy to express the various strange things it suggests. Mr. William Gannett looks at things in a larger way than his father; he is, in literature and theology, eminently of the period, as the phrase is; and there is something very odd, and, to one who reads between the lines, rather melancholy, in seeing Dr. Gannett's subdued and shrinking personality converted into a theme for a regular high-colored "story," with picturesque headings to the chapters. The whole work belongs to the class of "intimate" biography, and Dr. Gannett was so stubborn a conservative that there is a certain irreverence in the application of the process to him. It is a process by which some of his most familiar and most valued canons of taste are rather rudely handled. Dr. Gannett, for instance, had the misfortune to be lame, and to be obliged to use in walking two sticks with crutch-handles. It is not speaking harshly to say that this idiosyncrasy has been made a pretext for picturesque touches—used by the biographer as a pigment, an "effect." It is repeatedly alluded to, in a sketchy manner, to enliven the narrative; it constitutes the subject of two engraved vignettes. This is the sort of thing one looks for in the novels of Miss Stuart Phelps and Mrs. Harding Davis. Dr. Gannett's career was essentially limited and local; he evidently was a man of incorruptible modesty, and his own self-estimate did not err by over-liberality. Local, indeed, is Mr. William Gannett's memoir; it is conceived not only in the temper, but written in the vocabulary, of an especial phase of Boston civilization. But it operates as such a flinging wide of doors, such a tossing up of windows, such a lavish admission of searching, staring daylight, that, where much is intended to be pathetic, the image that most solicits sympathy is perhaps that of the venerable subject in his extreme bereavement of privacy. If we should say that the manner of all this is unwholesome, we should doubtless seem to be making an unkind charge, but we hardly know how else to qualify this latest development of literary portraiture. It is the trivial playing at the serious; it is not the masculine way of looking at things.

Dr. Gannett was a Unitarian minister in Boston from 1824 to 1871, and an account of his life involves a somewhat detailed history of New England Unitarianism during that long period. Mr. Gannett has treated of this subject in two interesting chapters—the best, perhaps, in his book. In the first he sketches the formation, early in the century, of the sect as a sect: "The Girding" he characteristically calls his narrative. In the second he depicts, with effective strokes, the great Transcendental and Radical schism of which Mr. Emerson, first, and Theodore Parker, later, were the most eminent apostles. The presiding spirit at the outset of Dr. Gannett's career had been Dr. Channing, and it was under his untarnished wing that he took his first steps in the ministry. He was Dr. Channing's colleague in the pulpit from the year 1824 until the latter's death in 1842. He then assumed the sole charge of the congregation, and kept it till his own sad death, by a railway accident, in 1871. He was purely and simply a minister, and in the practical rather than the intellectual sense. He produced nothing but his weekly sermons, and treated none but religious topics. He was a man, we should say, of an extreme simplicity of organization. He was a born minister; he stepped straight from his school days into the pulpit, and looked at the world, ever afterwards, from the pulpit alone. His piety was of a most strenuous and consistent type; what is called the "world" said little or nothing to him; in his tastes, in his habits, in his temperament, he was a pure ascetic; his life was altogether the life of the conscience. Religion for him, in fact, meant simply intense conscientiousness —an attitude of perpetual vigilance against wrong-doing. His conscientiousness, as his son intimates, was morbid and overdone. We read with a sort of alarm that the young lady he was about to marry had "a conscientiousness as certain as his own." Dr. Gannett's religious feeling was so intense and, if there had been a little more of what we may call "temperament" in it, one would say so ardent, that one almost wonders that he found himself able, in Unitarian soil, to sink his shaft deep enough. It would seem that he ought to have belonged to a Church of the rigid, old-fashioned sort. But he found his opportunity by making his Unitarianism as conservative as possible; he kept his faith, and that of his congregation, in so far as he could, where he found it, and conspicuously failed to avail himself of any later-born latitude of thought. Mr. Emerson diverged into magnificent vagueness, but we doubt whether Dr. Gannett went a step with him even in imagination. He opposed Theodore Parker, he had nothing in common with the Anti-Slavery group. Both at first and afterwards, he saw nothing in the Civil War but matter for regret. His biographer has printed in an appendix a number of his sermons, few of which were published during his life. He declined, sagaciously, shortly before his death, to make a volume of them, for he felt that, though they had played a useful part when addressed to a congregation with whom he was in intimate personal relations, they would not fall very forcibly on the ear of the world at large. They have a great deal of precision and earnestness of statement, but they strike us as almost painfully dry. They are meagre and colorless, and we think they lack the highest sort of elevation. They have neither spiritual passion on one side, nor marked intellectual acuteness on the other. Dr. Gannett's character, in short, viewed on the scale on which his son has unfolded it, is chargeable on the whole with an extreme dryness; it is not the sort of character which a race is the stronger for producing in more than limited quantity. It seems, somehow, too economically compounded; it has, as we said just now, a fatal lack of temperament. It has certainly done good service in the history of New England, and it has carried the mechanical development of conscience, as it may be called, to an extreme refinement.

But we doubt whether, experimentally, measured by sufficient periods, the type to which it belongs would prove to be the soil from which first-rate men spring—men either of large purpose or of large culture.

---

*Days Near Rome.* By Augustus J. C. Hare. Two volumes. (Philadelphia: Porter & Coates. 1875.)—Both Mr. Hare's subject, which is one of the most charming possible, and the great popularity of his 'Walks in Rome,' will assure his present work a general welcome. Ever since he had announced, in the preface to the 'Walks,' that it was in preparation, we had been eagerly impatient for it; and, on the whole, we have not been disappointed. He depends rather more than may seem desirable on other people to convey his impressions, and rather less upon himself; that is, he is a compiler rather than a describer. His own powers of description, though not brilliant, are always agreeable, and he might with advantage more frequently trust to them. His present work is, with modifications, fashioned in the same manner as the 'Walks'; the text constantly alternating with quotations from other writers. It was noticeable in the 'Walks' that almost every one who had written with any conspicuity about anything else in the world, had also written something about Rome that could be made to pass muster as an "extract." The extracts were sometimes rather trivial, but taken together they made an extremely entertaining book. The outlying towns and districts of the old Papal Dominion have lain less in the beaten track of literature, and the process of collecting pertinent anecdotes, allusions, descriptions, must have been a good deal more laborious. Mr. Hare has followed a very happy line. His book is meant for the average Anglo-Saxon tourist, who is usually not brimming with native erudition, and he reproduces a great many things which are probably familiar to the learned (though of which even the learned can afford to be reminded), but in which most people will find much of the freshness of unsuspected lore. He is abundant (as is quite right) in his quotations from the Latin poets—from Horace, Virgil, Ovid, and Juvenal. The smallest pretext for quoting from Horace—the most quotable of the ancients—should always be cultivated. For the rest, his tributaries have chiefly been the modern (English, German, and French) historians and antiquarians; to which it should be added, that his own share of the text is much more liberal than in the 'Walks.' In Mr. Hare's place, we should have treated the reader to rather less of Herr Gregorovius, the German historian and tourist, for this writer possesses in excess the deplorable German habit of transforming, in description, the definite into the vague. Unfortunately, he seems to have penetrated into the most deliciously out-of-the-way nooks and corners, and his testimony about various charming places is the best that offers.

The author has thoroughly explored the field, and left no mossy stone unturned which might reveal some lurking treasure of picturesqueness. The volume represents in this way no small amount of good-natured submission to dire discomfort. It is true that the inspiration and the reward were great, and that there is no bed one would not lie down upon, no tavern fare he would not contrive to swallow, for the sake of a few hours in such places as Norma and Ninfa, Anagno or Sutri. The Alban and Sabine, the Ciminian and Volscian hills, the romantic Abbruzzi, the Pontine Marshes, the Etruscan treasures of Cervetri and Corneto, the nearer towns along the railway to Florence, the direction of the Neapolitan railway as far as Monte Cassino—this great treasure-ground of antiquities and curiosities, of the picturesque in history, in scenery, in population, has been minutely inspected by Mr. Hare. Many of the places have long been among the regular excursions from Rome; others had to be discovered, to be reached in such scrambling fashion as might be, to be put into relation, after drowsy intervals, with the outer world. The author now tells us in detail the ways and means for following in his footsteps, and gives us valuable practical advice. He has made a great deal of delightful experience easier, but we hardly know whether to thank him. We see the mighty annual herd of tourists looming up behind him, and we sigh over the kindly obscurity that he has dispelled. It was thanks to their being down in no guide-book that he found many of the places he describes so charming; but he breaks the charm, even while he commemorates it, and he inaugurates the era of invasion. He has done a good work, but we should think that he must feel at times as if he had assumed a heavy responsibility. He makes in his opening pages a vivid and dismal statement of what the new régime means in Rome itself in the way of ruin of the old picturesqueness—a fact that had a perfectly substantial value which it is as culpable to underestimate as to exaggerate. But it is really a melancholy fact that he himself will have introduced a new régime into the strange, quaint places of the Volscians. The utmost that we can hope is that it will establish itself slowly.

---

*Bric-à-Brac Series.* Personal Reminiscences of Moore and Jerdan. Edited by R. H. Stoddard. (New York: Scribner, Armstrong & Co. 1875.)—We are not, as a general rule, fond of books of "extracts" of any sort; but it must be allowed that Mr. Stoddard is performing a useful work. There are a great many books that people are curious about which are too long or too dull or too much out of fashion to be attacked at first hand at the present hour. Mr. Stoddard may, apparently, be trusted to skim through them and cut out the most characteristic and entertaining pages. "Memoirs" are notoriously diffuse, and yet half the best anecdotes in the language are to be found in their pages. The eight octavo volumes of Thomas Moore's 'Diary' are, perhaps a conspicuous combination of the redundancy that the average reader dreads and the personal gossip that he longs to dabble in. Mr. Stoddard has compressed into a hundred and fifty small pages what he considers the most valuable portion of this copious record; but what he has given does not suggest that the present generation need greatly trouble itself about the remainder. Moore's period and circle of friends have become classic ground to people who possess what is called the historic consciousness, in a moderate degree of development. Rogers's breakfasts, Lord Holland's dinners, Byron's suppers, the hospitality of Abbotsford, the talks of Sydney Smith, the reunions of the Edinburgh Reviewers, were all occasions which have been in the habit of imposing themselves on our imagination with a suggestion of unattainable brilliancy—of unpurchasable privilege. Moore was *pars magna* of all these; but the perusal of his reminiscences is certainly reassuring to over-regretful minds. Anything more idle than most of his journalizing it would be hard to conceive. It is probable that he always selected the lighter matters for record in preference to the grave; he was a man of an extremely frivolous imagination and weak jokes, and thin personalities were the things he loved best to commemorate. But allowing for this, he lived with the best talkers of his time and was one of the shining conversational lights. He heard, of course, a vast amount of good talk; but we suspect, on his showing, that the average of talk among clever people was much lower—coarser, lighter, less cultivated—than it is now. Few of his professedly facetious stories—and of these he made a great collection—would do much toward keeping the tables of the present day in a roar. Mr. Stoddard gives many of his jokes and anecdotes; the run of them is decidedly poor. Here is one better perhaps than the average. "Told of Coleridge riding about in a strange, shabby dress with I forget whom, at Keswick, and on some company approaching them, Coleridge offered to fall behind and pass for his companion's servant. 'No,' said the other, 'I am proud of you as a friend, but I must say I should be ashamed of you as a servant.'" There are quotations from those parts of the 'Diary' relating to his visit to Byron in Italy, and various allusions to Scott—each reminding us afresh of Byron's unamiable folly and Scott's genial good sense. There are also extracts from Moore's record of his researches into the personal history of Sheridan, in preparation for writing his life; which reminds us afresh that of all profitless gossip the grea tstock of stories about Sheridan's smart sayings and loose doings is the most utterly profitless. They have always seemed to us singularly unavailable for either moral or intellectual purposes. The same may be said—though on different grounds—of the lucubrations of Mr. William Jerdan, editor of the *Literary Gazette*, patron of rising authors, and author himself of some elderly memoirs. He saw a great deal of the people of his day, and was apparently an estimable personage; but as a *raconteur* he is unpardonably dull and colorless. His literary importance may be measured by the fact that the performance in which he took most satisfaction was his standing godfather to much of the poetic progeny of the prolific but now forgotten "L. E. L." This lady is chiefly remembered by the tragical circumstances of her death (she poisoned herself, if we are not mistaken, at Cape Coast Castle, in Africa, where, after having married an officer in the English army, she had gone to live). We may connect her, on Mr. Jerdan's showing, with the more cheerful fact that she made, in her brief career, upwards of thirteen thousand dollars by her contributions to the annuals of the period.

---

*British Wild-Flowers considered in Relation to Insects.* By Sir John Lubbock, Bart., F.R.S., M.P., Vice-Chancellor of the University of London. With numerous illustrations. (New York: Macmillan & Co. 1875.)—At the last meeting of the British Association, a veteran botanist, in tracing the recent progress of systematic botany, contrasted the science of his youth (restricted, at least mainly and popularly, to the naming and technical study of genera and species by means of a few obvious external characters, dealt with under a sterile artificial system) with that of his

later years, when the whole life-history, distribution in space and time, and behavior as well as structure, of the vegetable races are taken into account. For a single exemplification of the change which has taken place in a single lifetime, nothing could be more instructive than the lecture on the relation of flowers and insects delivered at the same meeting by a young but distinguished naturalist, not specially a botanist. Imagine Sir James Edward Smith, along with the other founders of the Linnean Society, listening to a discourse on the advantage and even necessity of insects to flowers; upon the arrangements in hermaphrodite blossoms—seemingly most secure of connubial fruition—to prevent pollen from reaching stigma except by *hymen*opterous or other insect agency; upon the beauty which insects have imparted to flowers, and the new and varied powers which flowers in their turn have developed in insects, so that, while to insects "we owe the beauty of our gardens and the sweetness of our fields, to them flowers are indebted for their scent and color, nay, for their very existence in its present form." These gifts have been bestowed in a most roundabout way, and the hypothesis, of which these are some of the outcomings, is open to a certain amount of criticism. We are not going to explain or to examine it. Suffice it to say that the lecture aforesaid has since done service in a series of articles published in *Nature*, and these are now collected to form the present handy volume. It will be very useful in England, where there were no text-books or popular treatises upon this interesting subject, such as those of Hermann Müller, Delpino, Hildebrand, and Axell on the Continent, and where even the investigations and fertile suggestions of Darwin—from whom all this new knowledge is directly or indirectly derived—seem by no means to be widely known or comprehended. Whatever of original matter Sir John Lubbock has himself contributed is pertinent and excellent; but the book is mainly a compilation, and the figures borrowed. The account of the British wild-flowers in their natural orders covers too much ground too thinly for the greatest usefulness. The earliest chapters are the fullest and best. Especially good is the illustration of the gradual modification which the mouth-parts and legs of bees and butterflies are thought to have undergone so that they might profit by their visits to flowers—condensed from Hermann Müller.

*Transit of Venus.* A Popular Account of Past and Coming Transits. By Richard A. Proctor. (New York: R. Worthington & Co. 1875.)—For the purpose of the critical reader, Mr. Proctor's books may be divided into two quite distinct classes of extremely unequal merit. The first, including such works as those on the Sun and the Moon, are systematic and elaborate treatises on their respective subjects, which, in matter, style, and arrangement, leave little to be desired. The other class comprises collections of fugitive essays contributed to newspapers and magazines, abounding in repetitions and speculations, and not worth more than the casual reading which they receive in their original form. We are pleased to find that this work on the Transit of Venus belongs to the first class, and is one in which the reader may find a very full discussion of all the questions growing out of the observations of that phenomenon. It is largely historical, commencing with the transit of 1639, which was observed by Horrox, and concluding with a description of the preparations made by different nations to observe the late transit, and a discussion of plans for observing that to come eight years hence. On the whole, it is the most complete popular summary of the entire subject for general reference which we have chanced to meet.

*HARPER'S CATALOGUE.* The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS, Franklin Square, New York.

*CERTAIN NEW DEVELOPMENTS in British Cabinet History prior to 1766 are the subject of Macmillan's 'Reader.'—See page 232.*

*EPOCHS OF HISTORY,* Vol. V. 'Edward III.' By the Rev. W. Warburton, her Majesty's Inspector of Schools.'

"A model work of its kind."—*N. Y. Tribune.*

Volumes Previously Issued: 'The Era of the Protestant Revolution,' by F. Sebohm; 'The Crusades,' by Rev. G. W. Cox, author of a 'History of Greece'; 'The Thirty Years' War,' by Samuel R. Gardiner; 'The Houses of York and Lancaster,' by James Gardiner.

Volumes in Press: 'The Fall of the Stuarts,' by Edward Hale; 'The Age of Anne,' by Edward E. Morris; 'The War of American Independence,' by J. M. Ludlow; 'The French Revolution and the Wars that came of it,' by B. M. Cordery, author of 'King and Commonwealth.'

Each volume is enriched with maps and a carefully-prepared index. Price per volume, $1.

"This series is worth its weight in gold."—*London Spectator.*

FOREIGN BOOKSELLER AND IMPORTER,

77 UNIVERSITY PLACE, NEW YORK.

Large assortments of the publications of Charpentier, Didier, Didot, Hachette, Lévy Frères, etc., on hand; also complete lists of Tauchnitz's Collection of British Authors, and Teubner's Greek and Roman Classics. All European periodicals received in weekly parcels.

# The Nation.

*NEW YORK, THURSDAY, APRIL 8, 1875.*

## The Week.

CANAL reform, like most other things connected with the canals, moves slowly but surely. During the past week meetings have been held to denounce the contractors, and the *Tribune* has been engaged in "lifting the shadows" from "the past life of the Lord family," and letting in the unwelcome light on the corruption of which they seem to have been the centre. According to the Albany correspondent, this family has carried on a system of plunder more thorough and far better devised than any practised even by the old governing families of Europe. They have, he says, "bribed rival bidders to withdraw from competition; they have engineered through both Houses infamous relief bills for their own profit, each voting for them in his place; they are said to have made up pay-rolls from the local directory, and charged thousands on thousands of dollars for work which was not performed; they have pushed bills through the legislature for two-thirds of the proceeds, and then refused to divide; they have demanded percentage on claims the door for which they opened by legislative enactment; they have manipulated committees and canal boards and legislatures; they have been legislators and lobbyists at once and parliamentary brokers all the time; they have fairly drained the canals into their private treasuries." "Jarv." Lord, however, who is the head of the clan, or one branch of it, proposes to take part in the investigation now going on. He says that some abuses have undoubtedly crept into the management of the canals, but that the reason the expenses increase so much is because of the extortions practised in New York and Buffalo by the middlemen of those cities. Some people will be reminded by this, perhaps, of the explanation given a year or two ago of abuses in the Custom-house, which was, if we remember right, that the "thieves over in New York" were at the bottom of it.

The Governor's commission has not yet been appointed, and the name most frequently mentioned in connection with it has been that of General Barlow. The politicians say that he could not be confirmed because he is not recognized as a Republican. This, however, probably does not deceive anybody. General Barlow undoubtedly knows more about the canal frauds than anybody in the country, unless it is Mr. Tilden and Charles O'Conor; he has been the active enemy of the Canal Ring for a long time, and it is this fact, and not any want of Republicanism, which is against him. The effect of the canals on the judiciary, to which we referred last week, has received a striking illustration in an interview between Judge Sanford E. Church, Chief-Justice of the Court of Appeals, and a *Tribune* reporter. In the first place, we can hardly conceive any greater reproach, if we leave out of sight actual corruption, than that a judge of the highest court of the State should feel it necessary to explain to a newspaper that he is not in collusion with a gang of thieves. This feat, however, was not enough for the judge, but, being asked whether he knew the origin of the "newspaper attacks" on the court, he said that he did; that they came from General Barlow, who had "vented his spleen" upon the court "because he has happened to be unfortunate in his private and public litigations." It is difficult to imagine a more indecent thing than this coming from a judge and directed at a counsellor practising in his court. As to the "newspaper attacks," we may mention for the benefit of our readers that they rest chiefly on a charge made in a letter to the *Tribune* by Thurlow Weed, under his own signature, that one of the judges was "counted in"; and that the evidence for his statement is to be found in the published election returns, which Judge Church or any one else can examine for himself.

Early in the week the gold clique "unloaded," in the dialect of the Street, and the price of gold has since fallen to 114. It is estimated that the clique at one time held, out of the banks, about $12,000,000. The greater part of this has been restored, although it was put back too late in the week to make much impression on the bank statement, which shows the average condition for six days and takes no note of the actual condition on the day when the statement appears. As soon as it was known that the clique were out of the market, foreign exchange, which had been demoralized, immediately recovered, and rates soon advanced to within half a cent of the figures which justify the export of gold coin. The Treasury reported a coin balance on the 1st of the month of $84,105,520, or, deducting $24,191,900 certificates of coin deposits, $59,913,620. Its coin obligations between now and the falling due of the July interest are $14,185,000 for May interest; $15,000,000 for 5-20 bonds which by the fourteenth call mature May 1; $5,000,000 which by the fifteenth call mature June 1; and $30,000,000 which by the sixteenth call are due from now up to June 11. Of the latter, about $3,400,000 have already been sent in and paid. There are also $6,887,000 5-20s on which interest has ceased, and which were called before any of the calls named were issued. It is possible and even probable that the syndicate will be able to purchase and pay into the Treasury a considerable part of these called 5-20s in payment for new fives. To that extent no gold will come out of the Treasury, the operation being merely an exchange of one class of bonds for another. How much of the gold to come out of the Treasury will remain here depends entirely on the exchange market. About two-thirds of the interest to be paid is due to Europe, and a corresponding amount of the called bonds are owned there. Money continues abundant, and the currency withdrawn from New York banks to facilitate the April annual settlements in the Eastern and Middle States was this year less than usual. Demand loans are easily obtained, and mercantile paper known to be good is eagerly sought—one bank alone having purchased in a single day $600,000 four-months paper at 6 to 7 per cent. Speculation at the Stock Exchange has been less excited, but there has been a further advance in all classes of securities, Union Pacific having led the share market and gone above seventy. General trade continues to improve, but less rapidly than was expected.

Last week the Stock Exchange was placed on the verge of a panic by the failure of Mr. Daniel Drew, "the veteran operator," to make good his "puts" and "calls." It turned out the next day, however, that the reason was that he was sick at home, and had neglected to give instructions to his brokers about the matter. Mr. Drew is eighty-two years old, and at that age it is not surprising that a man should be sick and should forget his "puts" and be unmindful of his "calls"; but when his indisposition and his forgetfulness threaten the public with a financial crisis, it is not unfair to ask whether it would not be well for a person so well advanced in life to forsake the Stock Exchange altogether. There must surely be some pursuit which a gentleman of Mr. Drew's well-known piety could find distraction in in his last years besides betting on stocks. He may at any moment, in the natural order, have not only "to lay down on his stock privileges," as they say on the Street, but to "lay down on" everything in the world; and we beg most earnestly to suggest that he will, in the interest of society, prepare for that event by a complete retirement from business. We make this appeal to him as to an aged patriot; his pastor might reinforce it by considerations of a higher order, addressed to him in the character of an old sinner.

The Civil-Rights Act is gradually getting before the courts, and leading to the development of some very remarkable and novel law on the subject of inns and places of public amusement. In Trenton, New Jersey, a charge has been brought against the

proprietor of the Trenton House for refusing to allow two colored men to play billiards in the billiard-saloon attached to the hotel. The United States Commissioner first remarks, what we believe will be news to the framers of this wonderful enactment, that the Civil-Rights Act gives no more civil rights to colored men (except as to places of public amusement) than they had at common law, beyond providing a fixed penalty to be awarded by juries, and not leaving it at their discretion to fix damages at six cents. He adds that the prosecutors in the case before him have chosen to proceed under the criminal sections of the law, and he then goes on to enquire whether the "peculiar situation of this billiard-room" makes it "one of the accommodations, advantages, facilities, and privileges" of the hotel. This knotty point the commissioner manfully approaches and views from all sides, and finally decides that the billiard-room (though attached to the hotel) is not such an accommodation, and he also plainly intimates that he would decide in the same way of a livery-stable or barber-shop or telegraph-office, and, we suppose, a restaurant and the boot-blacking "privileges." Therefore, under this decision, the proud white man will still enjoy advantages of no mean order, while it begins to look as if the hotel was the most dangerous place a negro could enter if he wished to keep up his self-respect, and as if the only thing he would be allowed to do under the law would be to register his name and retire for the night.

---

The Democrats have carried Connecticut by a large majority—for their moral good, perhaps too large a majority. The Prohibition vote, which for several years has shown a tendency to decrease, and last year amounted to nearly 5,000, has fallen off, the Republicans profiting, of course, by the decrease. Messrs. Hawley and Kellogg are both defeated, George M. Landers and Judge Phelps of the Supreme Court taking their places. Whether anything is gained by the loss of General Hawley remains to be seen, but as to the other seat there can be no doubt. Judge Phelps is a man of character and ability, and the only objection urged against him was that it was a bad precedent to take a candidate from the bench. This we may admit to be true, but the bench in this case had nothing to do with the selection, so that while we may blame the party we cannot but be pleased at the result. The vote cast in Connecticut, like that in New Hampshire, was heavy, and the independence manifested by voters is said to have been great. On the State and Congressional ticket only one Republican secures an office. Mr. P. T. Barnum has been elected mayor of Bridgeport, and will bring to the office, we have no doubt, "rare executive ability" and "great personal tact." There is no objection to him as mayor of Bridgeport, where he is a large property owner, provided the people want him; and he has at his disposal means of upholding the dignity and splendor of the office, and doing the civic honors to strangers visiting Bridgeport, possessed by no other municipal dignitary in the world—not even the Lord Mayor of London. In higher offices, which require a greater simplicity of taste and a less popular sort of training, he might be out of place, but as a mayor he may certainly bid defiance to all rivalry. Very few mayors in the world could give a distinguished stranger a mount on a camel. That this, however, can be said of Mr. Barnum alone in this country is due to the defeat on Monday, in Cincinnati, of a rival showman, "Uncle John" Robinson by name. He was the anti-Democratic or Reform candidate; uncouth but honest, so his supporters alleged. But the shock of his nomination as a *pis-aller* seems to have been too great for the respectable voters of Cincinnati.

---

The Republican platform in Connecticut contained an Administration plank, and hearty endorsement of Grant's Louisiana policy. The candidate for governor, too, had taken a very prominent stand by firing a salute of a hundred guns over Sheridan's "banditti" despatch. And the result, taken in connection with that in New Hampshire, is a pretty clear indication of the state of popular opinion. The Republicans did all they could to carry the State; sent their best speakers to take part in the conflict; and tried to persuade the voters that the question to be decided was whether they would or would not rally round the Flag, and drown the rebel yell with a Union cheer. But the voters declined to look at the matter as a war-question, and went bodily over to the Democrats or ex-rebels, with the strangest indifference to the fact that they were in this way encouraging the spirit of rebellion and slavery. The Michigan judicial elections show steady Republican majorities.

---

A protest has been very extensively signed in this city against the compromise proposed to the Board of Education with regard to the Catholic parochial schools. It sets forth the usual arguments against the appropriation of any money raised by taxation to the support of denominational schools, and calls attention to the section of the School Law of 1851 which forbids all religious or sectarian teaching in the public schools, and to the section of the city charter which forbids the appropriation of any money from the municipal treasury for the support of denominational schools. We suspect, however, without having any positive knowledge on the subject, that the Catholic clergy would agree to everything the Board of Education might require if they could only have the appointment of the teachers. They made a proposal of a somewhat similar character some years ago to the School Trustees in New Haven, the fate of which we forget, in which they were willing to concede everything that might be required if they were only allowed to retain nuns, in the costume of their order, as teachers. In other words, they were willing to rely on the subtle influence of dress, manner, allusions, and so on, on the imagination of the children, in order to produce the results they aimed at. And then there are so many opportunities, if the teacher is sound, of introducing little and perhaps hardly noticeable innovations, of one sort or another, which, if they would not make conversions among Protestants, would at least remove prejudices or beget prepossessions. One of the cities in which the proposed plan has been tried, and it is said has succeeded, is Poughkeepsie, where it has been in operation for some time. There the Catholic schools have been handed over to the Board of Education, and its books and curriculum substituted for their own, but the Catholic teachers, being found qualified, were retained, and there is an understanding that in the appointment of teachers to these schools Catholic preferences are to be consulted. It may be taken for granted, however, that under any arrangement of this kind the church will get the best of it in the long run, because it has a powerful and trained army of servants, whose sole business is to watch their opportunity, while their opponents are changeful, or indifferent, or preoccupied.

---

The Boston *Advertiser* calls the attention of Senators Merrimon, Logan, and Ferry to a few facts with regard to the currency which seem to show that the "theorists" and "closet thinkers" and "blear-eyed pedants" in the last Congress knew more about the currency than the practical men. The practical men, it will be remembered, at the beginning of the last Congress, particularly those from the West, were in a state of great excitement because there was some $54,000,000 of bank currency which had never been "redistributed"—that is, taken from the States having too much under the existing law and given to those States having too little. The West, they said, had not enough money to "go round," and all sorts of terrible things were announced as likely to happen unless the currency were equalized. The theorists, on the other hand, maintained that the amount of money in any one place must be determined by the laws of supply and demand; that the currency was not wanted in the West and South because the panic and other causes had prostrated business more effectually there than in any other part of the country. Two laws, one the free banking law, and the other allowing banks to surrender currency they do not want, were actually passed, which enables us to determine which party was right. The *Advertiser* gives the statistics both of currency returned and new currency issued, with the following result—the "month of February being absent from the account." Last June, the Eastern and Middle

States had $235,000,000 bank currency; they have surrendered $6,000,000, and taken $6,600,000 new currency. "The rest of the country, the States and Territories which were deficient in currency, had $118,000,000 circulation last June, and having surrendered $11,288,000 of this amount, only $4,342,000 has been taken again. While, therefore, the aggregate note circulation of the country has diminished since last June by more than six millions, the whole reduction is due to the States where the deficiency was alleged to be greatest, and where the clamor for free banking was loudest." The *Advertiser* therefore concludes that the theorists, in contending —(1) that where money was scarce it would be unwise for capitalists to invest in national-bank circulation; (2) that the business of the country did not demand an increase of bank-note issues; (3) that the privileges of national banks, though constituting a monopoly, were not a valuable monopoly—were not far out of the way.

We do not profess to be versed in North Carolina politics, but we believe we were substantially right in saying that the House of Representatives of that State recently expelled a member (Mr. Thorne) ostensibly because of his theological opinions, but really because he was a Radical Republican from the North. A correspondent, writing from Wilmington, seeks to correct us by stating that the resolution of expulsion "was offered by H. T. Hughes, a negro, the 'Radical Republican' representative from Granville Co., and was supported by other Republicans. It was opposed by some of the ablest Democratic members, and upon its passage only 77 votes in all were cast in a House numbering 120 members." As to the mover of the resolution we have no information, but if colored he did not appear in the final vote, when out of 46 voting yea only two were Republicans, and these white. On the other hand, out of 31 voting nay ten at most were Democrats, and one of these we presume was a North Carolina Friend who stood up for his co-sectarian. This seems to fix the responsibility so strongly upon one side as to justify us in calling the expulsion a party measure. In fact, it is only in this light that it becomes intelligible. Mr. Thorne went up to the General Assembly as (to use the language of the Democratic organ in Raleigh) "the acknowledged leader of 2,500 ignorant Warren County negroes" and "a carpet-bag civil-righter and miscegenatist." As such, he was worth getting rid of—by a Democratic Assembly. They began by bringing a charge against him which they could not sustain; they ended by convicting him on a charge which had no warrant in the Constitution. This is certainly more like politics than piety.

During the Connecticut campaign a speech was made by Mr. Blaine, in which he found much fault with the Southern whites for their absurd complaints against the Republicans. The Southern Conservatives, he said, complain that we in the North keep alive quarrels which are really over and settled, when in reality it is their lawless and revengeful spirit which forces us to keep these issues of the war open. As a general thing, it is difficult either to prove or disprove assertions with regard to the real spirit of a people, because, if we point to their acts, it is said that they do not exhibit their *real* spirit, but are merely a pretence, and that, with regard to the South, if the troops were once removed, the real spirit of wild revenge upon the negro, which is only awaiting its opportunity, would burst forth again. Fortunately, however, a little event has just occurred between South Carolina and Massachusetts which is a pretty good proof that the real spirit of at least one State in the South is not so bad as has been represented. If we were seeking for a State in which the feelings engendered by the war had completely died out, we should not select South Carolina, because we should have supposed that the hot-blooded citizens of that State would be inclined to attribute most of the anarchy and corruption of the past few years to the interference of the North in their domestic concerns; besides this, there was no State before the war so bitter towards the North, no State which had so much to answer for in bringing on the war, and no State in which during the war such fierce revenge was threatened in case of success. The particularly bitter feeling between Massachusetts and South Carolina was rendered all the more so by the fact that the former State invaded the latter with negro troops officered by white gentlemen in a war for the destruction of slavery. Any one who remembers the fierce exultation which prevailed throughout the South when Colonel Shaw fell at the head of the Fifty-fourth Massachusetts, in 1863, and was "buried under his niggers," would hardly look to South Carolina for cordial expression of feeling toward Massachusetts, or *vice versâ*. Nevertheless, such a thing has now taken place, the regimental flag of this same Fifty-fourth Massachusetts regiment having been restored to Massachusetts by General Ripley, then in command of the Charleston garrison; while at the same time there has been a presentation of a flag by the military organizations of Boston to the Washington Light Infantry of Charleston. General Ripley, in doing this, refers to the "gallant conduct" of men "like Shaw, Putnam, and other sons of Massachusetts," who "sealed their devotion to the cause they adopted with their lives." Now, this may be all a pretence on both sides, but for ourselves we should be sorry to believe it.

The petition for an order to wind up the Emma Mining Co., which has been pending for some time before the English Court of Chancery on behalf of some of the disgusted stockholders, came on for a hearing on the 24th ult. It appeared that the petitioners only represented 225 shares, while the opponents of the order represented 20,000, and under these circumstances the Vice-Chancellor said he had no alternative, and must deny the motion, but added that if he acted on his own judgment of the enterprise he would grant it, inasmuch as the company was "formed on delusive statements emanating from persons on the other side of the Atlantic," and "there was no doubt the mine was long ago exhausted." The petition was then ordered to stand over until a meeting of the stockholders could be held—presided over by a person appointed by the Court—so as to obtain some formal expression of their opinions as to the future of the company. Some of the stockholders hope, we believe, that although they cannot find the vein they bought from Park and his friends, they may find another.

The making a cardinal of Archbishop Ledochowski does not, the Pope must observe with regret, inspire a more reasonable spirit in Germany. In fact, it has revealed a disposition to find renewed fault with the distribution of honors by the Holy See. The Pope, in short, has the same trouble about his "slate" that the President of the United States has in dispensing offices. There are sure to be grumblers over this or that evidence that their "section" (*pars orbis*) has been neglected by the Church Universal, who loudly make claims to some representation here or a fuller representation there, based on numbers, or services and fidelity. So the German press is in a carping vein because, having examined the Papal Calendar for 1875 ('La Gerarchia cattolica e la famiglia pontificia') it finds Germany conspicuous by its absence from among the registered dignitaries. Italian preponderance is notorious. But England, too, which is in no sense a Catholic country, is more strongly represented than Germany. Even Croatia is allowed more weight, just as in the Œcumenical Council the *Culturvölker* of Europe were swamped by the delegates from inaccessible and semi-barbarous regions of the East and the Southern hemisphere. By the strictest computation, it is alleged that the Germans scattered over the globe form at least a seventh part of the whole number of Roman Catholics, yet can point to but three cardinals out of fifty; and among these Prussia, with millions of Catholic subjects, counts none, and Germany but one, Prince Hohenlohe. Barely twenty Germans and Austrians are discoverable in the more than a thousand bishops. The same disproportion exists throughout the lower degrees of the hierarchy; and when we take into account the moral and material worth to the Church of any European people as compared with Asiatic, African, and Polynesian converts, it is hard to resist the conclusion that in the eyes of the Papacy the Germans are, in the words of one of their newspapers, "Catholics of the second or third class."

## THE PRESS AND THE COURTS.

THE Storey contempt case in Chicago is not one which at first sight would seem to be of very great importance. The Chicago *Times* is a newspaper which lives by means of purveying to the public those kinds of "sensation" which are sure sooner or later to get their purveyor into trouble; and if, instead of being horsewhipped by some aggrieved person, the editor is sent to jail some fine morning for contempt of court, and released in the evening on a *supersedeas*, most people would be inclined to say that he had got off easily. The contempt committed by the *Times* consisted in the publication of articles attacking the good names of members of the Grand Jury, the apparent object being to prevent the finding of indictments against the editor of the paper. On the 13th of February, it seems, the Grand Jury had found no less than four indictments against him, some or all being for obscene publications, and other complaints against the *Times* were under consideration. That paper, finding that there was warm work ahead, began immediately a systematic attack on the Grand Jury, pouring out a flood of abuse, referring to the members by name in terms of which the least offensive were "common drunkards," "sports," "bummers," and "gamblers"; denouncing the indictments already found as "mean, pitiful revenge"; and declaring that the *Times* would carry on "the battle" to "the end." The Grand Jury upon this appealed to the Court for protection, whereupon the judge, after hearing the arguments of counsel, announced his decision, which, in its way, is almost as remarkable as the publications which led to it. It consists in great measure of high-flown rhetoric, of the sort with which a French judge or prosecuting officer indulges himself, but which is seldom heard from an American or English bench. The court would, he declares, if deprived of public confidence through the libels of the press, be "as powerless and pitiable as Samson in the lap of Delilah." No greater offence, he continues, can be committed by any man than "to stab justice in her own temple and at her own altar." A judge must take duty as "his Polar star"; but, on the other hand, "duty cannot be learned in the school of fear." "The storm may rage, but one may patiently and calmly bide its buffetings." The defendant, he found, was apparently determined "to ruin if he could not rule," and accordingly, with an evident determination firmly fixed in his mind to "form a hollow square" about the administration of justice, the court sentenced the accused to ten days in the county jail, from which he was released a few hours later under a *supersedeas*, on giving bail.

As we just now said, we should not at the first blush have thought that the press of Chicago would take a very deep interest in a case of this sort, for the reason that it is one unlikely to occur again, and involves no sacred rights on the part of the press; for the right of a person accused of crime to blackguard the Grand Jury which is finding true bills against him, is not one in which the liberty of opinion or free discussion is bound up. But, as a matter of fact, the newspapers in Chicago have almost unanimously denounced the opinion of Judge Williams as a dangerous precedent, and a bill has been introduced in the Illinois Legislature to prevent a recurrence of such proceedings by restricting the power to punish for contempt to matters occurring in the presence of the court—doing away, that is, with what is called "constructive contempt," and leaving the power intact only so far as to give courts summary jurisdiction over such offences as the refusal of a witness to answer when sworn, the contemptuous or indecent behavior of persons in open court, or the disobedience of orders issued by the court.

Probably the case has excited more attention, and deserves it the more, because it has come immediately after a number of other cases in which the press and the courts have come into conflict during the past two or three years, and which have turned generally upon the right of the press not to attack maliciously the reputation of public men, but to discuss grave abuses in the administration of government. Generally, these cases have taken the shape of libel suits, but they may also come up in the form of contempt proceedings; and as, in the majority of cases, the attacks have really been justified by public opinion and the facts, the judicial proceedings taken have not had the effect of bringing the less reputable newspapers to their bearings (an effect much to be desired by the press at large), but have had a tendency to make a wide breach between public opinion and the incumbents of all public offices taken together—judges among the rest; to deepen the suspicion with which the public and the press regard those who for the time being have the control of local or general government in their hands, and thus create a sort of contempt for the administration of justice which works against the courts and against the best interests of society, even in the plainest ordinary cases. We have always believed, and still believe, for instance, that the so-called "gag-law" will be found to impose no new obligation on the press, and to be an enactment harmless in itself; but the harm which has been done by the widespread belief that a certain number of leading politicians in Washington were actually engaged in a deliberate attempt to gag the press and to drag editors to Washington for trial, is incalculable. So, too, when a well-known New York editor, on being summoned to Washington to testify before a committee of Congress, is arrested on a charge of libel, the outrage simply results in widening the breach a little more, so that the next editor who is subpœnaed to Washington openly declines to go there, on the avowed ground that he considers the summons a mere trap to get him to the District of Columbia and then arrest him.

These considerations make it extremely important that the power of courts to punish for contempt should receive more thorough and competent discussion than it has hitherto had, and for this reason we desire to point out one or two things which seem to have been generally overlooked. Several of the States, and the United States itself, have passed statutes to limit the power, which, in its original and common-law form, is not only summary but absolutely without limits; that is to say, a judge might imprison, fine, and, for all we know, torture a person guilty of contempt, he being at the same time the sole judge of what contempt was. In other words, it was a relic, one of the last, of the purely arbitrary power lodged in the courts as representatives of the sovereign. Now, in modern times it has been generally felt that this jurisdiction was too barbarous and comprehensive for civilized life, and an attempt has been made to distinguish between actual contempt of court—*i.e.*, acts or words tending to impede, hinder, or embarrass the administration of justice—and constructive contempt—*i.e.*, acts or words tending not to impede the administration of justice, but such as are by a mere fiction construed by courts into contempt. To this distinction there can be no sort of objection, provided it is carried out logically and rationally. But it is not carried out in that way. In most of the statutes which have been passed on the subject, the reformers have proceeded on a clumsy theory that the nature of the offence depends on the place where it is committed; and in the proposed Illinois statute, as given by the papers, we accordingly find that the power is to be confined to matters occurring in the presence of the court. This distinction is, however, almost utterly baseless. To take a very common case: it is essentially the same kind of offence for a witness to refuse to answer a question put to him on the stand, as to run away on hearing that an officer has come to summon him. In fact, so far as refusals to obey a process of court go, the only question can be whether the refusal was made not in the presence but within the jurisdiction of the court. With regard to another common class of offences, those which consist of scurrility and abuse, or defiance of the judges, jurors, or other officers, the question is one of degree, but has little to do with locality. If a party to a cause in court threatens a witness with words or gestures, it is a clear case of contempt; but is it any less so if a newspaper, day after day, threatens, intimidates, maligns, and accuses out of court? Yet, if the distinction between what is done in the presence of the court and out of its presence were correct, one would be contempt, and the other merely contempt by construction of law.

It should be borne in mind, also, that it is only by a very loose

usage that the power of a court to compel obedience to its process can be brought under the right to punish for contempt at all. The power to compel a witness to attend and answer questions is nothing more than the natural exercise of the normal jurisdiction of a court, and it would be almost as logical to speak of a decree for the specific performance of a contract, or an injunction, as coming under the right to punish for contempt, as it is in the case we are considering. Every court must have power to make its authority felt; but this is very different from cases in which an attempt is made to impede the administration of justice in indirect ways. One of these indirect attempts was made not long ago in this city by Tweed's lawyers, who did not by any means attempt to impede the process of court, but did try to bring the impartiality of the presiding judge into question in an irregular way. Now, if this had been done, not in court, but by publication in a newspaper, or two or three newspapers, would the offence have been less or greater? Unquestionably greater. Yet, if we adopt the distinction of locality, the latter would merely have been a "constructive" contempt.

The true distinction between actual contempt and constructive contempt we should take to be rather indicated by the nature of the acts or words, their intent, and their probable effect, than by the place where they are committed or spoken. To hold a newspaper in contempt, for instance, for publishing articles complaining of actual delay in the business of the courts, or criticising in a temperate or even indignant manner real abuses in the administration of justice, would clearly be an attempt at introducing "construction," not because the newspaper was published out of the actual presence of the court, but because such criticism has not the object or the result of impeding justice, but rather of advancing it.

Besides this distinction, another thing that should be taken into consideration is that the feeling excited in the press by contempt proceedings is chiefly due to their summary character, and, above all, to the fact that the judge is "judge in his own cause." There may be cases in which this is unavoidable, but the difficulty could frequently be obviated by a provision that cases may be sent to another court for trial—which is actually, we believe, the practice in France in the case of insults to judges. As a matter of fact, this end seems to be reached in Illinois in a roundabout way through a *supersedeas*.

## A NEW KIND OF SCAPEGOAT.

As the spring is now opening, the usual number of hardened villains who propose to spend the summer in foreign travel are getting ready to slink out of the country, by some one or other of the steamship lines plying between this port and Europe. How they can do it we do not see, for never, within our recollection, have the shame and criminality of their proceeding been so fully exposed. They have indeed been held up to public scorn and indignation within the past week in terms that recalled a good deal of the contumely heaped upon another class of our fellow-citizens—those who have suffered the administration of this and other large cities to run down during the past fifty years by neglecting their political duties and avoiding the "primaries," and so enabled bad men to be elected to office. Possibly they are the same class, the "absentee" of the summer having accumulated the money which he spends abroad by keeping far away during the winter months from the primaries and conventions and caucuses. If so, the absentee is probably case-hardened, and no denunciations have any terrors for him, for he has grown accustomed to them. Even if he were to pause in his career, and be brought to believe that his unpatriotic and nefarious conduct in taking money out of the country, and spending it for his own gratification in other countries, is steadily impoverishing the United States, we can hardly hope that it would prevent his going. He would probably say that the United States must look out for that; that it was not impoverishing him; and that as long as the steamers continued to run, he should go to Europe whenever he iked.

But it will not do for us to take this selfish and cynical view of the subject. If it be really true, as we have seen it recently stated, that this is "one of the gravest questions which the present day offers for consideration"; that we in the United States are poorer by the exact amount which is "carried away" and spent by the "absentees" in Europe; and that the amount so spent "has done no little towards enabling France to pay off her war debt," and in England "has raised the price of living in hotels about fifty per cent.," it might be a question how far this thing ought to be allowed to go, and what legislative or executive measures ought to be taken to prevent people going out of the country. When, too, we reflect on the other branch of the question, that "the mischief is not all done when the summer's tour is ended," but that the returning tourists come back "laden with foreign goods"—with shawls, dresses, linen, furniture, china, plate, chairs, tables, clocks, ornaments, carpets from France, leather from England, and spoils from the East—that these imported articles enter into ruinous competition with the native products, thereby cutting down the profits of business, and thus, in the end, rents, one is tempted to exclaim at least, *O tempora! O mores!* and perhaps even to join in the cutting satire suggested by the *Times* of asking the "proud owner" of these treasures, "Have you anything American in the house besides yourself?"

The cudgels have been taken up for the "absentees," however, by the *Bulletin*, and that paper has undertaken to show that the American absentee, so far from injuring the prosperity of the country by his absence, positively increases it; because, if he were to stay on this side of the water, he would not, unless he wholly changed his nature, begin at once to dress his wife in American silks, to buy clocks from Connecticut instead of Paris, and, in general, to substitute the products of our own manufacturers for those of the pauper-toil of Europe. He would, on the contrary, continue to surround himself with these things, because they appeal to his taste, by means of importations; and as he is not a producer, he would contribute nothing to balance the account; whereas, if he goes to Europe, he relieves this country of the burden of a non-producing class, and, by taking some work off the hands of the distributing class, enables more people to engage in production.

The fact is that, by the use of the term "absentee" for people who spend the summer abroad, a class of persons are invested with a name which is meaningless. If this country were cut up into large estates, owned by people living abroad, and worked by tenants fixed to the soil, out of whom the largest rent possible must be squeezed, we should have something like an absentee system; but such an idea is as grotesque as the Granger comparison of the modern Illinois farmer to the French peasantry described by La Bruyère in the seventeenth century. There are undoubtedly a large number of Americans who go abroad to take a vacation whenever they feel inclined to go, but their absence has little or no effect on the management of their property here. As a general thing, their property consists of stock or bonds—that is, of credits representing money advanced and actually employed in industry, or of real estate yielding a rental strictly proportioned to its agricultural or business value. The employment of this capital in the best way is the thing they most desire.

Of course there can be no doubt that if this country were as interesting to European travellers as it always has been to European emigrants, the United States would attract a large travelling public as well as a large emigrating public. But, as we pointed out last summer, this is precisely the difficulty. Americans go abroad to travel because they find in Europe what they cannot find here—things which are more comfortable and more pleasing to the taste, fancy, and imagination—things which take them out of the hard, dusty turmoil of work a day life into an atmosphere of art and beauty, and venerable and romantic tradition. This they will unquestionably continue to do so long as the steamers will take them. And in the interest not of trade, but of everything higher and better than trade, it is for the benefit of the country that they should do so. By means of an extremely prohibitive tariff and a paper currency, we have managed to cut ourselves off in great

measure from the rest of the world, and to force the great majority of the people of the country to live upon domestic products, whether they are good or bad, cheap or dear. Importation by the wealthy and luxurious, and trips back and forth by the "absentees," are almost the only free channels of communication with the outside world which are left us, and the only means of knowing the progress which is making in art and science and industry among the civilized nations of the world.

But the revival of the word "absentee," and the attempt to fasten it upon the people who spend the summer in Europe, is only one more indication of the popular tendency to saddle upon some conspicuous class any or all of the evils which are observed to be generally prevalent, and of which the class, far from creating them, is itself the result. Attempts have been repeatedly made to cure the evils of the civil service by heaping denunciations upon the "office-seeker," the office-seeker being himself nothing in the world but the product of a multiplicity of offices distributed as a reward of political service. So the evils which come from over-production, following in the wake of a swollen transportation system, have been laid upon the shoulders of the "monopolist" by another class of reformers, the monopolist being himself not less than the Granger the unhappy product of the swollen transportation system. All the evils of city government have been fastened upon the people who refuse to "attend the primaries," though their non-attendance comes in fact from their knowledge that the evils of the city government deprive them of influence in the primaries; while, on the other hand, those who do make a business of doing their duty as citizens by going to all the primaries, caucuses, and conventions, serving on delegations, working for the party, and, in a word, "taking care that the republic receive no harm," find very soon that they belong to a disreputable class known as "professional politicians," and are dragging the country deeper into the mire every day, and that their "attending" the primaries is now called "running" them; that their presence at caucuses is because they have no independence, and at conventions because they are engaged in an attempt to "capture" them. So, too, with the "absentee." Having a country blessed with "the best currency the world ever saw," and with a tariff which greatly increases the cost of living, it stands to reason that a large number of people of wealth and of luxurious tastes will spend as much of their time abroad as they can. But that is no reason why we should mistake cause for effect, and denounce the "absentee" because we continue to support a system which makes "absentees."

## THE LONDON CLUBS.

London, March 13, 1875.

THERE is no part of the huge economy of this overgrown capital which has spread so much of late years as what is called club-life. The great size of the town makes a club of some sort a necessity to almost any one who has the bad luck to live in it. Most men of business reside in the west end of London, at Notting Hill on one side of Hyde Park, or South Kensington on the other—five or six miles from their places of business in the City. Professional men, barristers and solicitors in particular, have their chambers in Lincoln's Inn or the Temple and the neighborhood of the Law Courts, three or four miles from their residences in the West of London. Members of Parliament, owing to the late hours which they have to keep, as the House of Commons rarely rises before midnight when anything is going on, still haunt the old-fashioned streets and squares of Westminster and the Belgravia district, but not a few of them have migrated to South Kensington. To all these classes of people, clubs become almost as essential as dwelling-houses: places where they may lunch, read the newspapers, meet their male friends pleasantly, dress for dinner, and so on. In Queen Anne's time, and during the reign of the Georges, London was a very small place as compared with what it is now. The politicians and men of fashion had their coffee-houses and gaming-houses, which served some of the purposes of modern clubs. In those days a merchant, or a practising lawyer, or a professional man would as soon have thought of being presented at court or driving a four-in-hand as of belonging to a West-End club. But we have changed all that in these more democratic, wealthy, and luxurious days. The merchant, though he can rarely find his way into Brooks's, or White's or the Travellers', or any of the more exclusive clubs, has his City club and his West-End club as a matter of course, just as he has his carriage and perhaps a box at the opera. The lawyer has his university and his political club, and the politician and man of letters have their two or three clubs, just as the men of fashion had of old. The clergy used long ago to frequent the Alfred, which was pronounced by a competent critic—the late Lord Dudley, I think—to be the dullest place in existence, "the asylum of doting Tories and drivelling quidnuncs." But the clergy have migrated from there to the University clubs, and the more dignified among them to the Athenæum. And, if we can believe a reported saying of a late Lord Alvanley, better known as Pepper Arden, they have not added to the joviality of that learned association. On being asked whether he still belonged to the Athenæum, he answered: "No, not exactly. I stood it as long as I could, but when the seventeenth Bishop was proposed I gave in. I really could not enter the place without being reminded of my Catechism." The *Quarterly Review* narrates that anecdote, so if it is a libel on the Club or the Bench of Bishops or the Catechism, that respectable periodical is responsible.

Dr. Johnson defines a club to be an "assembly of good fellows meeting under certain conditions." The definition is at best vague, and it is more than doubtful if the great lexicographer would have considered it entirely appropriate to the modern institution. Mr. Thackeray's Old Brown of the Union Jack "stretched on the best sofa, sitting on the second edition of the *Times*, having the *Morning Chronicle* between his knees, the *Herald* pushed in between his coat and waistcoat, the *Standard* under his left arm, the *Globe* under the other pinion, and the *Daily News* in perusal," could hardly come within the category of good fellows. But there is not a club in London, nor in New York either, I dare say, which cannot number several Old Browns among its members. It matters little what may be the basis of the club, or for what purpose it was established, Old Brown finds his way into it. It has always been the same, and will be so as long as human nature remains unchanged. But my intention is not to moralize on the effects of club-life upon the male character, but to tell you something of the London clubs.

Previous to the institution of these establishments of the modern type their place was supplied by taverns and coffee-houses. The politicians of the middle and early part of last century assembled at the St. James Coffee-house, and from it most of the political articles in the *Tatler* are dated. Learned and literary folks frequented the Grecian. Locket's, in Gerrard Street, and Pontac's were the fashionable taverns of the time, and White's Chocolate-house in St. James Street was the favorite resort of the same company in the evening.

Brooks's Club in St. James Street—all the clubs gravitate towards St. James Street and Pall Mall as the sort of ἀμφαλὸς γῆς of modern times—the haunt of the aristocratic Whig of the present day, was founded in 1764, and was originally a gambling-house started by Brooks, a wine-merchant and money-lender. Many curious scenes were enacted within its walls about the end of last century when Fox, Selwyn, Sir Joshua Reynolds, Garrick, Horace Walpole, Gibbon, Burke, and Sheridan were among its members. The old betting-book is still extant, and, though the bets were not so eccentric as some in the betting-book at White's, it is not without interest to find the names of Fox, Selwyn, and Sheridan recurring with an unexampled frequency. It is now one of the dullest and one of the dreariest clubs in London. It is filled with grumblers at the present state of things, and old Whig fogies moaning over the departed glory of their clique. Household suffrage having "dished" the Whig ascendancy, Brooks's has for some years been politically a nonentity. Time and fashion have interfered with the original purposes for which the club was founded. Gambling has lost its charms for the descendants of Fox and his contemporaries. A cock-fight in the morning-room would not be a greater novelty than a bank at faro, and you might as well expect to hear the clash of rapiers on the staircase as the rattling of the dice-box at the hazard-table. Those who wish to play or bet go to the smaller clubs in the immediate vicinity—the Turf Club, Pratt's, and the Arlington—where they meet perhaps a less select but certainly a more lively fraternity. Gambling and politics being in abeyance, Brooks's has kept up its old character for nothing but exclusiveness. Sheridan was blackballed three times by George Selwyn because his father had been on the stage, and he only was admitted through a ruse of George IV., then Prince of Wales, who detained Selwyn in conversation in the hall whilst the ballot was going on. Better men than Sheridan have been blackballed since, mainly because they were rich and had no hereditary connection with the governing families of England.

White's Club was established in 1736, and stands in St. James Street, nearly opposite to Brooks's. Bubb Doddington and Colley Cibber were among

the original members. Gambling and costly entertainments, and the bay window looking into St. James Street, used to be the principal attractions. The entertainments were of the most gorgeous character. In 1814, the club gave a ball that cost close on £10,000—an enormous sum in those days; and three weeks afterwards they gave a dinner to the Duke of Wellington that cost the members £2,500. To keep up such hospitality, gambling became more popular in White's than in any other club, and betting on any subject capable of controversy became a foible. The old betting-book is in itself a revelation of the times—more curious perhaps than improving. The coat-of-arms designed for the club by Horace Walpole and Selwyn indicates the prevailing passion. Blazon is vert (for a card-table), three parolis proper on a chevron sable (for a hazard-table), two rouleaus saltier between two dice proper, on a canton sable; a white ball (for election), argent; the supporters, an old and a young knave of clubs; the crest, an arm out of an earl's coronet shaking a dice-box; and the motto, "Cogit amor nummi." Round the arms is a claret bottle ticked by way of order. I do not say that these arms were entered at the Herald's Office. But they throw some light upon the pursuits of the members, and the familiarity with these pursuits of the designers of the arms.

Of the more modern clubs of the exclusive class, Boodle's, the Travellers', and the Marlborough (the Prince of Wales's club), are the best. The Travellers' is in Pall Mall, next door to the Reform. It was founded in 1814, about the time that the old military and naval clubs were formed, when men came home after the peace and wanted occupation. The fundamental rule of this club is that "no person shall be eligible who has not travelled out of the British Isles to a distance of at least five hundred miles from London in a direct line." Sixty years ago, it did not take much to constitute a traveller. Under this rule, there is not a Cook's tourist who has crossed the Channel who would not be eligible. Following on the institution of these clubs came the Athenæum and the two University Clubs. The latter keep up a solid character of dull respectability; the former is, take it all round, and despite of Lord Alvanley's horror of its episcopal character, the best club and the most interesting in London.

The political clubs proper are the only other clubs of much importance. There is an infinite number of smaller institutions which have sprung up like mushrooms round the "centre of the earth"—military clubs and junior military clubs, diplomatic clubs, whist clubs, and fine-arts clubs. But none of these have any history attached to them. The growth of the political clubs is of some historical importance. In the year 1831, the Tory party became alive to the fact that their opponents, the Reformers, by means of unions instituted throughout the country, had greatly advanced their political opinions. Determined to counteract this pernicious influence and to keep the command of the Parliamentary elections, they established the Carlton Club. The project suddenly came forth supported by a list of all the leading Tories and ex-ministers of the day, followed by a train of magistrates, lord-lieutenants, ex-governors, and ambassadors. It was a great political association, organized to unite the scattered fragments of Toryism and to re-establish the Tory supremacy. A Political Committee was appointed, and a political secretary, to keep up communication with local associations and to manage the registration of voters and the Parliamentary elections of the future. This was the beginning of the political club properly so-called. The Carlton soon made its influence felt in the country, and the Reformers, on the principle that it was lawful to be taught by their enemies, established a similar organization under the auspices of the Reform Club. In the history of these two clubs the sweetness of the uses of adversity is interestingly manifested. With the exception of one or two brief intervals, the Tory party have been in opposition since these clubs were instituted, forty years ago—and what has been the effect upon the fortunes of the clubs? The Carlton has raised up four or five institutions worse than itself, all contributing to a central fund managed by the leaders of the Tory party in their central office, with an organization spreading over the whole of England and Wales, and with branch-offices in Scotland and Ireland, all working together, and controlling, so far as such organizations can, the elections in almost every constituency. The Reformers, on the other hand, glutted with success, have allowed their organizations to die out. The party character of the club has almost disappeared. There is still kept up the fiction of a Political Committee, but it is unable to control the political conduct of the members of the club, and utterly powerless to influence a single election in the most loyal constituency. For years the chiefs of the Liberal party have been impressed with the inferiority of their political machinery, and have been tentatively throwing out suggestions for the establishment of a new Liberal Club. But nothing came of it until the shipwreck of their party last year brought them face to face with their misfortunes. They set about the formation of a new club in a workmanlike fashion, and ten days ago they opened it in spacious temporary premises at the head of St. James Street, under the name of the Devonshire Club—a pleasing tribute to the family of their leader the Marquis of Hartington. Whether it succeeds or not depends upon its management. It has opened under good and under bad auspices. The straits in which the party are at present are a kind of guaranty that the interests of the Club will at the commencement be well attended to. But the situation is one of evil auguries. The committee have taken for their temporary settlement the notorious gaming-house called Crockford's or "The New Pandemonium." Here, between the years 1827 and 1840 (when Crockford, who started in life as a small fishmonger, retired into private life a millionaire), more money changed hands at play than in all the other clubs in London. The knowing ones, particularly those of the opposite side of politics, say the place is doomed. Every scheme which has been started in these gilded saloons since 1840 has come to grief or bankruptcy, and the Devonshire Club is bound to perish like the rest. Meanwhile, the Tories, taking time by the forelock, as they always do, have erected a pretentious building on a new site altogether, close to the Houses of Parliament, looking out on the river flowing under the club windows, for the convenience of Members of Parliament of the Tory side of politics. Nothing can exceed the excellence of this establishment. A covered way leads from the door of the club to the underground railway, by which you can go to any part of London, and another covered way leads to the House of Commons across the street. An electric bell from the Speaker's table communicates with the club, so that when the House has been cleared for a division and the sand-glass turned, loyal party men may leave their comfortable rubber in the St. Stephen's Club, or their game at pool, and rush along the covered way in time to take such part in the division as the Tory whip directs. This is reducing party government to something like a science, and carrying it on with that maximum of comfort which the exigencies of the case admit.

## AN ITALIAN "NOTION."

ROME, February 6, 1875.

THE knowledge of living languages is daily becoming a greater necessity all over the world, as international relations are more closely cemented by rapid communication. Each one in his own profession, be he soldier or student, Government employee or simple citizen, feels an acquaintance with modern languages to be of importance to him. In Italy, where the floating population of the towns is composed of strangers, this is particularly the case, and especially so from the fact that Italian commercial men pride themselves on treating with their correspondents in their several languages. This has necessitated a widespread knowledge of foreign languages among a class who could not afford regular instruction, and from this very pressure laid on them has resulted an institution unique in its kind and answering to its aim so perfectly that there is now hardly a town of any commercial importance in Italy which is without a Philological Club, as it is called.

To convey an idea of what this is, let me give a short account of the Turin Club, which was the first founded. It arose from an association of seven or eight young men who wished to learn English, and constituted themselves into an evening class after their daily work was over, their joint means enabling them to pay a teacher. Finding the system answer beyond their hopes, they determined to extend to others the benefits of mutual help, and hired a room on the fourth floor in a narrow street in Turin, issued circulars, and opened the first Philological Club in August, 1868. It was instantly crowded to excess by persons eager to avail themselves of such privileges, and, the attention of the municipal authorities being drawn to it, they granted a *locale* in Piazza Carignano. At the end of a year (1868–1869), the Club numbered 412 members, taught seven living languages (French, English, German, Spanish, Arabic, Hungarian, and modern Greek), and was in receipt of $2,543 contributed by the members, plus $140 from the town and $50 from the Chamber of Commerce. Several learned Italian philologists and men of science were named honorary members to add to the repute of the rising institution, and for it the best teachers in the town gladly gave up their time, though the pay was then only $10 per month. In the second year (Oct. 1, 1869–Sept. 30, 1870), the members increased to 530, and two more languages were taught, Russian and Portuguese. The receipts now amounted to $3,462, nearly $800 more than the previous year. Examinations were now held and diplomas granted in the several languages. In the third year (Oct. 1, 1870–Sept. 30, 1871), the society again overflowed into a larger place of residence (its present abode), and opened schools for women, of which we shall speak later. The income this year was rather over $4,200, in which is included the yearly subsidy from the municipal

authorities, which they raised to $200, and the $50 from the Chamber of Commerce.

In this year, the rules of the society were modified to their present shape. They are very simple: the members name a committee of fifteen at the general yearly meeting, and this committee elects from its own number a president, vice-president, a censor, treasurer, cashier, librarian, and collector of dues, whose various duties are clearly defined in the statutes of the society. The committee also names the professors, who cannot be chosen from among the members. The schools are open from the 15th of October to the end of June, and should one class become overcrowded, another for the same language is opened. The members are of two kinds, active and ordinary. The latter frequent the schools, and pay one dollar monthly for so doing. They are not admitted without proper enquiries into their respectability; but the committee is more careful in the choice of active members, who all take part in the general meetings. These members can only be elected by the unanimous vote of the whole council, and they bind themselves to pay eight dollars yearly for three years. In this way, the mere scholars, whose interest in the society is only a passing one, are kept out of the administration. Ten free places are granted to youths who have not the means of pursuing their studies. There are reading-rooms and a library, amply provided with newspapers and reviews and many standard works, which are at the disposal of all the members. Besides the classes in languages, there is a class in stenography and one in comparative philology. A few more figures, and we have done: on the 1st of October, 1873, cash in hand, $777 50; on the 1st of October, 1874, cash in hand, $853 40. These speak for themselves.

It may be of interest to know to what classes of society the men who throng these schools belong. This can be ascertained through the interesting pamphlets of the vice-president, to which I owe most of my information. In the first year there were 412 members; of this number 160 were merchants (*commercianti*), 78 employés, 75 students, 21 lawyers, 20 engineers, 10 military men, 6 doctors, 5 priests, 4 professors, 3 accountants, and 30 of divers other professions. The average number of members who attended each class was: 106 for English, 94 German, 87 French, 42 Spanish, 8 Italian, 7 Arabic, 6 Hungarian. These figures naturally vary, and in the next year the French class was the best attended; in the third year, the German. The merchants in the third year were second in rank, and the students were the most numerous. It was also noticed that 153 members in 1871 ranged in age from 15 to 20; 12 from 21 to 25; 44 from 26 to 30; 26 from 31 to 35; 10 from 36 to 40; and 8 were over 40 years old.

I must now speak of the schools for women, which were opened December 15, 1870—as soon, that is, as a suitable apartment could be provided. On the day of the opening there were 109 members already inscribed, and this number rose in a few days to 142. These schools are managed by a committee of ladies with a directress or lady president at their head, the whole under the superintendence of the president and committee of the Club. One of the reasons given for the great success of this public school for women in Turin, where it was likely to be regarded as very unseemly to attend it, is that the male members were forbidden the use of the Club between the hours of 12 and 4 P.M., when these classes were held. The ladies of many of the highest Turin families diligently followed the classes, and all came copy-book in hand to the monitress, who corrected the exercises while the professor lectured, so that no time was lost, and the books were returned as soon as the lecture was over. Women cannot become active members, but as ordinary they have access to the library and reading-rooms. The results of the studies in this section are, according to the president, Signor Cibrario, more satisfactory than they are among the men. He accounts for this by the female classes being held in the best hours of the day, when the women come fresh to their studies, while the men have only the evening hours, from 8 to 11 P.M., and are tired after their day's work. To show the liberal spirit which pervades the Club, I may mention an instance in which the female element—as it, alas! so often does—ranged itself on the clerical side and decided to close the schools on the day of Pope Pius IX.'s jubilee, even gaining over to their side the directress, an enlightened woman. The administrative council, however, while respecting the Catholic religion in common with the directress, considered that the study of languages was equally divided among Catholics, Protestants, and Jews, and therefore, revoking the incautious decision, ordered that all the schools, without distinction, be opened on the day of the Papal jubilee, and announced in a manifesto posted in the different rooms of the Club, that "the Philological Institution keeps itself entirely aloof from every religious opinion and practice."

The elements of the brilliant and rapid success of the Circolo were manifold, but the essentials may be summed up under three heads: firstly, the great lessening of expense obtained by the power of association—*i.e.*, the payment of one dollar a month for the enjoyment of all the benefits and privileges of the Club; secondly, evening schools and evening lectures from 7 to 11 o'clock, being the hours in which men are free to attend; thirdly, gratuitous services of the administrative officials. The regulations also are very few, thus leaving the dignity of the member unimpaired. I may now give a short sketch of the workings of a few among the other Philological Clubs which have arisen in different parts of Italy, and, to begin with, that of Florence. The Syndic, Sig. Peruzzi, was the first promoter of the idea. Having just been deprived of her short-lived honor as capital of Italy, Florence required to be reminded of her old and glorious traditions, and needed a fresh impulse to urge her on the road to learning. It was thought that by diffusing a knowledge of modern tongues, industry and commerce would be encouraged; and certainly the need of some such institution must have been felt, for barely a year had elapsed after the foundation of the Club (opened in January, 1872) before the society outgrew its modest apartments, and petitioned the city for the use of one of the many handsome palaces at its disposal. The demands for admittance at the schools had enabled the society to open 16 courses, in which the chief modern languages were taught, and to subscribe to 70 reviews and magazines, and to 33 Italian and foreign newspapers. By such an unexpected success, the society was enabled to pay off all the expenses of starting, and had left $465 as a reserve fund. In the first year, the students numbered 118, in the second 312, this number increasing daily. The active members in 1872 were 365; in 1873, 685; from which figures we may perceive that the Florence Club is assuming more the character of an ordinary club—250 members on an average frequent its reading-rooms daily. Evening *conversazioni* are also held; these are gradually becoming more numerously attended, as invitations for a month are extended to strangers; also members of other Philological Clubs have free access to these meetings, and every stranger of note, on his arrival in Florence, is invited there. The schools for women have not thus far developed in a satisfactory manner, and only one class for English has been opened.

At Genoa, the *Circolo filologico e stenografico* was founded in 1872, the same year as the Florence Club, but it rather languished at first from want of funds. An enterprising member, Avvocato Berio, got up a loan of $800 in bonds of $5 each, which were readily disposed of. This attracted general attention, and on March 1, 1874, the female section opened with one hundred and seventy-five names, divided into the following classes: two for French, two English, two German, and one Spanish, one class for telegraphy, and one for declamation. The direction is in the hands of a committee of lady patronesses. This Club aims chiefly at the education of women, and in a printed circular to the Genoese nobility and gentry, begging for contributions of books or money for the enlargement of its library, the Board especially prays that only such books may be given as will be of real use to women, who have hitherto, it says, fed on fantastic novels from circulating libraries. One evening a week is devoted to a lecture, on any subject of general interest, by the best professors in the city, and this is attended by male and female members, and often terminates with music. The active members of this Club, excluding those that attend the schools, are one hundred and forty-four in number. A weekly paper is issued, publishing the number of scholars and giving an account of the weekly lecture. The *Circolo* at Leghorn has greatly prospered. It was opened in 1872, and numbered, December, 1874, 239 active and 100 ordinary members. It has assumed the form of a serious club, in which chess is the only game allowed. This is a great impediment to allowing women to share in the educational advantages, as we have seen in the case of Florence, and there are consequently no classes for them. This is the only Club which has started without monetary help from the Municipality and Chamber of Commerce. In Milan, they have a *Circolo* for women alone, which has hitherto not succeeded. The men's Club, which is a separate enterprise, has met with the happiest results, and counts 600 members. In Rome, the institution is but one year old, so that it has not yet a history. Ancona, Alessandria, and Pisa have also successfully imitated Turin, the first two being commercial cities and the last a university town.

Searching for similar or corresponding institutions in other countries, I find nothing that resembles the Italian Philological Clubs. In England, the nearest approach is the Taylorian Institution, established not long ago by Sir Robert Taylor; but this really has none of the distinguishing features of these Clubs. In France and Germany, there is certainly nothing like them. This is, I believe, the first instance in which the Italy of to-day takes the lead of the civilized world in the cause of education, and she does so in a thoroughly practical spirit, laying her foundations on the great principle of mutual help.

# Correspondence.

## GOOD AND BAD GRANGERS.

To the Editor of The Nation:

Sir: In the *Nation* of the 18th instant I notice a letter from Eau Claire, Wisconsin, signed "F. R. L.," to which you, Mr. Editor, have appended a note that does much to intensify the wrong done to the Grangers of this State by your correspondent.

There is no doubt but that "the Potter law was the result of an outburst of passion, manipulated with mischievous skill by ambitious politicians." The same might be said of the foolish legislation of this winter with equal truth. Charging this folly to the Order of P. of H. is an outrage, and the statement that the Grangers are responsible for the present state of things is false in every particular.

If "F. R. L." was "in Madison during most of the time when legislation concerning railroads was progressing," and I have no doubt he was, he must know that the Grangers of Wisconsin are no more responsible for the action of the legislature in this matter than is the Editor of the *Nation* himself.

"F. R. L." says: "The leaders of the Granger element are" (not were) "shrewd and unscrupulous, the rank-and-file well drilled and submissive, and the temper of the whole organization narrow and vindictive." All of which must have originated in the "narrow and vindictive" brain of "F. R. L." without a particle of evidence to sustain it.

"F. R. L." must have known—at least must have been culpably ignorant of what was passing around him if he did not know—that from the time the railroad legislation commenced until the end, there never was a meeting of any kind of the Grangers in Madison having any reference whatever to the legislation to be had on this question or any other.

Members of the legislature, Grangers, and Non-Grangers met daily to consult on the action to be taken in regard to the railroads, but not as Grangers, neither were they of a class for whose acts the Order can or should be held responsible.

I believe there was not a Granger in the Legislature who had ever been heard of outside his own Grange as belonging to the Order, much less having a controlling influence in its ranks; yet one cannot but wonder and be sorry that even such as these should have placed themselves under the control of men of such small calibre as Potter, Quimby, and Lee—men who have about as much sympathy with the Order of P. of H. as "F. R. L.," and no more.

Even the Milwaukee *News*, which has been the most outspoken in its denunciations of the Potter law, and has never, I believe, been guilty before this of uttering a word in favor of the Grangers, did us the justice of saying in its issue of the 9th instant that "it was a bogus Granger element and a false Granger sentiment which was led by dishonesty and demagoguery in the late legislature to the hostile legislation on the subject of railroads. All the leading Grangers in the State—the best men among the Patrons—the officers of the State Grange, and the men who founded the Order and who brought it to its high position of power and popularity among the Wisconsin people, were in favor of legislation which would bring substantial relief to the railroads, and through them to the other business interests, the industries and commercial enterprise of the State. Such Grangers as Governor Taylor, Colonel Cochrane, Lieut.-Governor Parker, W. Orledge, R.R. Commissioner Osborne, and others of equal rank and position among the Patrons, had read the lesson of hard times, business depression, crippled credit, and languishing industry, and they were ready and willing to endorse reasonable measures of relief."

The Milwaukee *Commercial Times*, in commenting on these remarks, said:

"The *News* now admits that it is the spurious Grangers who are to blame for the illogical, half-loaf, spiteful measure of relief to railroads adopted by the late legislature. . . . No expression of indignation can be too harsh for those demagogues and blatherskites who pretend to be Grangers when they are not, merely for the purpose of misrepresenting the objects and the spirit of that great and respect-worthy movement of the agricultural class for self-protection and reform. The real Grangers have only asked for themselves what is just. They are ready, and they have been at all times ready, to accord what is just to the railroads."

The following was set forth in the *Nation* about two years ago:

"The contest now going on in Illinois is one of the early skirmishes of the impending war which, unless we greatly err, is destined to produce industrial, social, and political changes in this country of the most startling description. The locomotive is coming in contact with the frame-work of our institutions. In this country of simple government, the most powerful centralizing force which civilization has yet produced, has within the next score of years yet to assume its relations to that political machinery which is to control and regulate it."

The Grangers of the West recognize the truth of this, and appreciate the magnitude and unscrupulousness of the power with which they have to deal in this contest far too well to place themselves in a false position by committing such an egregious folly as this we are accused of by "F. R. L.," and for which we are so unmercifully condemned by the *Nation*.

The leading railroad men of Wisconsin will not agree with "F. R. L." in this assault upon the Order, I am certain. But if *he* is deserving condemnation for a wrong done to a class, how much more must the *Nation* be deserving censure, when it proclaims to the world that investments are unsafe in Wisconsin, and that "the spirit at the bottom of the Granger legislation is, in fact, one of sheer and simple dishonesty"—thus condemning the P. of H. as a whole for the sins of men over whom they had no control, and for whose acts they cannot be held responsible, but for which they must suffer as much as the proprietors of railroads. I submit that instead of curses they should have the sympathy of the *Nation*.

A Granger.

Kenosha, Wis., March 27, 1875.

[This dispute about the responsibility of the Western attacks on the railroads has lasted now for two years, and we for our part are tired of it. The terms "Granger movement" and "Granger legislation" have been used by us and by the press of the whole country to designate in a general but sufficiently definite way the various modes in which the Western grain-growers have been seeking, since the summer of 1873, to put on the railroads the burden of carrying their produce to markets which, in the natural course of trade, they could not reach, including the utterance of violent attacks, like that of Mr. W. C. Flagg before the Social Science Association, on all dealers in money and all corporations as the deadly enemies of the agriculturist, whose profits Government ought to cut down. Whenever we have called attention to any particular display of this folly, we have received remonstrances like the above, assuring us either that the persons guilty of it were only pseudo-Grangers or obscure Grangers or parasites, and that we ought not to mind what they said, because the "Patrons of Husbandry," we suppose, had not formally commissioned them. But this is mere trifling. The fact is that the feeling and aims on which the Granger organization is based have produced an agitation and led to legislation as we believe of a mischievous character, which have to be denounced and exposed without waiting to find out whether any particular promoter of them was a good or a bad Granger, or was high in the order, or only known in his own lodge.

The *Nation* fully adheres to the sentiments expressed in the paragraph which our correspondent quotes. It has advocated in season and out of season such railroad reform as will deprive the corporations of their corrupting influence on legislation, and has, therefore, denounced strongly, in the interest of political morality, no less than of private rights, legislation like that of Wisconsin, which, if maintained, would furnish several powerful companies with motives of the strongest kind for buying up the legislature every winter, and furnish every rascal in the State with the chance of a small fortune, if he could only get elected to it. A legislature which fixes railroad rates is as sure to become corrupt as a hungry dog to carry off an unprotected beefsteak; or, in other words, to add the guilt of dishonesty to the guilt of incapacity. We have looked in vain for any attempt on the part of the Grangers to bring about serious and careful legislation in aid of railroad reform. If we could see anything of the kind we should heartily support it, none the less heartily even if it at first accomplished little. The "Potter law" is, in fact, a fair specimen—though the worst, we admit—of their contributions to the solution of this most difficult problem; that is, a frantic and reckless attack on the property of the stockholders and bondholders without enquiry, and in a passion, under the guidance of an ignorant farmer, who confessedly knows nothing about transportation, and whose only idea of reform was to cut down rates. We have warned persons against investing in Wisconsin for the following reasons, all of which still hold good, and which we still seriously commend to the attention of the prudent:

1. The security for money lent to a State or invested in a State does not consist, as negotiators of loans always try to make people believe, in the extent of its natural resources, but in the character of the people, as expressed in legislation and in the administration of justice. Hence some of the naturally richest countries in the world are the worst fields for the employment of capital.

2. Judged by this statement, Wisconsin stands to-day on a par with the semi-barbarous states of Asia or South America, because the people have permitted to be enacted or encouraged legislation affecting enormous amounts of capital belonging to foreigners, either under the influence of simple greed, or of passionate resentment against certain trustees of this property living in the State. It matters not which of these motives was the more powerful. The fact that such legislation is possible as against strangers, and that it has during the past two years greatly diminished the value of railroad securities—or, in other words, has inflicted serious loss on thousands of unoffending persons, and filled their lives with anxiety—is enough of itself to put careful people on their guard against Wisconsin investments. Against passionate legislation no pledges or promises in quiet times offer a sufficient guarantee. Nobody would trust a private person who had shown himself capable of cheating his creditors when he got into a rage.

3. Last, though not least, in addition to the legislative excesses in which the State has indulged, its Attorney-General has gone into the State courts, and laid down the doctrine that when the State granted a charter for commercial purposes it had either the right to seize the property invested in the State under the charter, and confiscate it, or to compel the holders of the charter to devote their capital to philanthropic or charitable, instead of commercial, purposes; that, in fact, the granting of the charter, or privilege of carrying on an industrial undertaking in a certain way, deprived its conductors of the common property-rights in the money they put into it. The doctrine was allowed by the State courts, and the Governor celebrated and proclaimed the decision, which was worthy of Ashantee Land, by firing cannon. Morally, it stood on the same level with the proposition that the Legislature might in its discretion authorize the Governor to call out the militia to truss travellers on the public highway.

We have been found fault with for saying these hard things, on the ground that they will exasperate the Grangers and their allies in Wisconsin, and prevent an amicable settlement. With that, we hold, we have nothing to do. If we saw a man cheating at cards, it would be our duty to warn both those who were playing with him and those who seemed likely to play with him, without regard to the effect on his temper, or to the probability that he would, if made angry, refuse to refund. If any conflict of duty arises in the matter, we think the press owes more to those who have lent no money to Wisconsin people than to those who have. The spoliation of last year is done, and cannot be undone; but future spoliation of those who are now looking around for investments can be prevented. Finally, the cause of public morality, which is the greatest cause of all, demands that States as well as individuals should be made to understand that honesty is the best policy.—Ed. Nation.]

## MORE LATIN PUNNING.

To the Editor of The Nation:

Sir: Something good may come of even a bad pun, and the letter of "F. H.," in last week's *Nation* (p. 222), with the appended editorial note, made me more than content with the *Academy's* exposure of my lack of "prosodial accuracy." You have shown that the joke—a vile one, I confess—is at least entitled to the respect due to age. In the way of self-defence I have not a word to add, and it is only as matter of literary curiosity that I note a few other instances of the perpetration of this pun by writers not absolutely ignorant of prosody. Plautus liked it so well that he introduces it twice in a single play. You quote (from Amph. 721–724) one of these passages. The other is in the scene between Mercury and Amphitryon (1031–2):

"*Merc.* Prodigum te fuisse oportet olim in adulescentia.
*Amph.* Quidum?
*Merc.* Quia senecta aetate a me *mendicus malum*."

*Mendicare malum* may mean 'to beg an apple,' or 'to beg a *hap-ill*' (as, by a still worse pun, Thornton and H. T. Riley have translated it), *i.e., quaerere mălum*. It is worth noting that Amphitryon's sensitive ear was offended by Mercury's deficiency in prosodial accuracy, and he comes down on it with more than editorial severity in the next line:

"*Amph.* Cum cruciatu tuo *istuc* hodie, verna, *verba funditas*."

There is a neat play on mălum and mālum in one of the anonymous epigrams of the Latin Anthology, "de Judicio Paridis." You will find it in Burmann's edition ('Anthol. Vet. Lat. Epigramm.'), i. 94:

"Extat caussa *mali malum* cessisse Dionae
Cur ruerint Graja Pergama pulsa manu.
Dat Veneri *malum* formae pro munere pastor,
Cum Junone *malum* victa Minerva dedit."

To go from malum to pejus—Burmann, in a note to the above, quotes from the 'Menagiana' (iii. 133), the old Monkish-Latin verse on the fall of Adam, and its consequences:

"Mala mali malo ma'a contulit omnia mundo."

And this reminds me of the Latin catch which every school-boy knew forty years ago:

"Malo malo malo quam malo vivere."

I believe that both Ovid and Martial may be convicted on circumstantial evidence of having *conceived*, if not openly committed, the objectionable pun. Read Ovid's 'Epistle of Acontius to Cydippe' (Her. Ep. 20), and the reply. When Cydippe is made to complain of the fraud by which Acontius had entrapped her into a promise of marriage, she calls the apple which he threw at her feet

"volubile *malum*
Verba ferens doctis insidiosa notis" (209, 210).

He acknowledges his fault—"sit scriptum injuria nostrum"—but pleads love as his excuse, and promises that, after their marriage,

"Aurea ponetur *mali felicis* imago,"

on which shall be inscribed the lines (239, 240)—

"Effigie *pomi* testatur Acontius hujus,
Quae fuerint in eo scripta, fuisse rata."

Here the apple is *pomum*, and in line 9 it is merely "ab arbore foetus"; but Cydippe regards it as a 'rolling mischief,' and Acontius promises, if his trick succeeds, to consecrate a golden likeness of the 'lucky hap-ill.' That Ovid was equal to so wretched a pun, the next epistle (21,239) gives evidence in the play on the name of Acontius, with Greek ἀκόντιον.

"Mirabor quem tibi nomen *Acontius* esset;
Quod faciat longe vulnus, *acumen* habes."

So Martial (x. 94) plays on the edge of the pun without fairly venturing to make it, contrasting the "plumbea *mala*," which even thieves found too bad to steal from his farm at Nomentum, with the "cerea *poma*" he had bought in Rome, in the Suburra.

There is another epigram, the point of which turns on "grandia mala," meaning either "big apples" or "great penalties," but as the text is, in more than one sense, corrupt, I will not quote it here. Readers of Martial will know where to look for it.

I have already occupied too much space in your columns, but to show how much trouble "the apple of discord" has made in the world, I am tempted to add a word to recall Joh. Lang's famous translation of a passage in the 14th book of Nicephorus (Callistus) The ecclesiastical historian had used the hackneyed expression "τὸ μῆλον ἔριδος ἐς μέσον βάλλειν," which Lang rendered by "Contentionis *ovem*, vehementer *eam perstringens*, in medium protulit" It was Gilbert Cousin ("Cognatus"), I believe, who first pointed out this mistake. J. H. Trumbull.

Hartford, April 5.

# Notes.

MR. JOHN T. WOOD, whose excavations at Ephesus in behalf of the British Museum are well known, though less widely than those of Smith and Schliemann, has been lecturing very acceptably in Boston. He is prepared, we believe, to deliver single lectures or a course of lectures in any other city concerning his discoveries in and about the Temple of Diana, and we hope he will not lack invitations. His illustrations by means of drawings and stereoscopic views are very entertaining and instructive.——We are glad to observe that Mr. Edwin Simpson's pleasant little work entitled 'Dramatic Unities in the Present Day,' which we noticed briefly on page 175 of our last volume.

has reached a second edition (Trübner).——Estes & Lauriat are the American publishers of the very handy 'Globe Dictionary,' which offers a copious vocabulary, careful definitions, the pronunciation and etymology of each word, and a large number of woodcuts. Perhaps it is no drawback that some approved or confirmed Americanisms are omitted. *Bunkum* we find, and *switch* (railroad sense), and *monitor* (iron-clad), and *caucus*; but not *primary*, nor *Ring*, nor *town-meeting* (though *town-hall* and *town-house*), nor *freshet*, nor *boom* (in the lumber sense). Speaking, by the way, of Americanisms, the *Celestial Empire* (Shanghae) does us more and less than justice in saying, in an article on this subject: "We can hardly expect ready credence from our readers; but assure them nevertheless that a discussion is now going on in the leading paper of America—the *Nation*—as to the advisability of cutting 'philologist' down to 'phillog,' and 'utilitarianism' to 'uty.'" Our readers do not need to be informed that these monstrous forms were proposed by an eminent English "phillog," Mr. A. J. Ellis, and effectively combated in our columns by an American, Dr. Fitzedward Hall. ——And speaking of dictionaries, a correspondent complains of Masson's French Dictionary that under R it gives no title after *ruminer*, whereas the French Academy's Dictionary (5th ed.) gives 53 titles after that word, occupying a quarto page, besides 51 others in the supplement, and Littré gives 55; "nor are these titles rare or unimportant." One at least of these (*ruse*) is omitted in accordance with Masson's false economy of suppressing in the French-English portion every word which is spelt the same as in English. ——D. Lothrop & Co. have in press an English prize essay on 'The Temperance Reformation: Its Claims upon the Christian Church.'——In the *New-England Historical and Genealogical Register* for April there is an interesting sketch of Dr. Ezra Green, surgeon on board the *Ranger* under John Paul Jones, who lived to the great age of 101 years and 20 days. A steel portrait of him at 100 shows a bright and well-preserved old man. An article on the "Early Paper-Mills of New England" also deserves mention. ——Scribner & Co.'s *St. Nicholas* has absorbed the *Schoolday Magazine* of Philadelphia, and the *Little Corporal* of Chicago.——We learn with regret from the Hartford *Courant* that among the books destroyed by the burning of the *Churchman* office in that city last Thursday was the nearly completely printed third volume of the Collections of the Connecticut Historical Society. Its contents were: (I.) "Pierson's Indian Catechism," printed originally at Cambridge in 1658—the first book by a Connecticut author written and printed in this county. (II.) "Will and Doom; or, The Miseries of Connecticut under an Usurped and Arbitrary Government," written in 1692, by Rev. Gersham Bulkely, of Glastonbury. This very curious work, never before printed, was furnished with an introduction and notes by C. J. Hoodly. (III.) Extracts made by Dr. Benjamin Trumbull in 1772 from letters written between 1729 and 1736 to Rev. Thomas Prince, of Boston, by sundry members of Connecticut, giving historical accounts of some forty or fifty of the older towns in the State.

—Among recent Government publications on our table, the complex Interior Department naturally furnishes the greater number. A large volume of more than seven hundred pages is occupied by the annual report of the Geological and Geographical Survey of the Territories under Dr. F. V. Hayden, for 1873. The seat of operations was in Colorado, and embraced the South and Middle Parks, the valley of the Arkansas River, and generally the district from Denver and Golden City to Cañon City. Maps, profiles, sections, outlines, and picturesque views of the extraordinary Rocky Mountain scenery are given in profusion. The reports on the palæontology and zoölogy of the Territory are also accompanied with plates. Of special value is the account of the rich mineral deposits, the mines of coal, galena, silver, and gold. Part IV., geography and topography, contains a very interesting discussion, by Mr. James T. Gardner, of the elevation of certain datum-points on the Great Lakes and rivers and in the Rocky Mountains. It has since been printed separately, with a map showing the railroad and canal lines used in determining elevations. "The elevation of the Great Lakes and surrounding country is found to be about 9 ft. more than previously reported by the State geologist of Ohio, and that of St. Louis [428.29 ft.] about 23 ft. higher than reported by Humphreys and Abbot. While Kansas City [763.52 ft.], and all the surrounding country for many hundred miles south and west, has heretofore been reported more than 100 ft. too low, Omaha [997.90 ft.] is raised about 31 ft., and Indianapolis [721.75 ft.] about 100 ft." A companion brochure to the foregoing is 'Lists of Elevations principally West of the Mississippi River' (3d ed.), by Mr. Henry Gannett, of the same Survey. This gives the heights of places and mountains; of some foreign mountains by way of comparison; of passes (the highest being the Argentine Pass in Colorado, 13,000 ft.); of plateaux (U. S. and foreign); of lakes; of the timber line (11,900 ft. in Colorado); of successive points at the water-level of rivers, etc. Railroad and barometric profiles are added. It is odd to find some of the American mountain heights ascribed to Petermann's *Mittheilungen*—first-rate authority, but hardly an independent source. A Catalogue of the publications of the Hayden Survey, and a Bulletin (No. 1 of Second Series) also deserve notice. Mr. W. H. Jackson, the photographer, narrates in the latter an excursion into Southwestern Colorado, among the cañons and mesas once occupied by an aboriginal race, whose lookouts and almost inaccessible dwellings are monuments of the insecurity of the times in which they were built. A few sketches illustrate this paper. Another bound volume issued by the Survey, and containing quite as much matter as the first of the above-named, is Dr. Elliott Coues's 'Birds of the Northwest,' a hand-book of the ornithology of the region drained by the Missouri River and its tributaries. Those who are familiar with the author's writings on his favorite subject do not need to be told that this work is as entertaining as it is authoritative. It is enlivened with many graphic descriptions of the circumstances under which a given species was first encountered. The index occupies more than fifty pages.

—From the Navy Department comes a translation of Dislere's 'Iron-Clad Ships of the World,' by Commander R. W. Meade, U. S. N. The comparative tables are well worth having and studying. Nos. 54 and 61 of the publications of the Hydrographic Office (Bureau of Navigation) are 'Deep-Sea Soundings in the North Pacific Ocean' and the 'Rio de la Plata.' The cruises of the U. S. steamer *Tuscarora*, Commander Geo. E. Belknap, in 1873 and 1874, are well known to have had for their object the determination of the ocean bed, with a view to the laying of a submarine cable between California and Japan. The present volume briefly sketches the routes pursued—viz., along the two coasts of the Pacific, and across *via* the Sandwich Islands; describes with figures the apparatus used in sounding; tabulates the soundings and temperatures; and shows in a number of profiles the ascertained bottom on the several lines, together with the isothermal strata. A general track and current chart completes the work. We should mention also that part of the soundings were on and off shore between Cape Flattery and San Francisco. The profiles thus obtained show a gradually shelving bottom for about thirty miles out, when a precipice is reached forming the side of a deep trough sloping upwards from south to north. It is a matter for sincere regret that Congress was unwilling or unable to appropriate the sum of $60,000 asked for by the Office to continue the examination of the Pacific Ocean; not by naval vessels in commission, but, as we believe the plan was, by two schooners cruising in company from east to west diagonally across belts of the ocean, so as to pass over or in plain sight of every part of the unexamined ground. There are in the Pacific many islands and other perils to navigators, whose positions are not known to within from ten to a hundred miles, if known at all. New harbors and advantageous coaling and repairing stations for our cruisers would not improbably be discovered by such a scouring of the Pacific seas.

—This failure on the part of Congress seems all the more regrettable because of the added scope that would have been given to a very useful and meritorious branch of the Bureau of Navigation. The Hydrographic Office is, we believe, but a little better than four years old. It is the proper complement of the Coast Survey, the latter being restricted by law to the coasts of the United States, and the former having to do with all foreign coasts. Thus far it has been obliged to content itself with obtaining from foreign sources the information which is so essential to navigation and trade. Thus we find among its publications as translations or compilations the following: 'General Examination of the Mediterranean Sea'; 'Winds, Currents, and Navigation of the Gulf of Cadiz'; 'Northwest and West Coast of Spain and Coast of Portugal'; 'General Examination of the Atlantic Ocean' (1870), and 'Navigation of the Atlantic Ocean' (1873); 'The Azores'; 'Madeira, the Salvages, and the Canary Islands'; 'The Coast of Brazil'; and, lastly, the 'Rio de la Plata.' The two last named are compilations by Lieut. Commander H. H. Gorringe. That on Brazil to some extent, but more remarkably the work on the River Plate, shows a departure from the common "sailing directions" of other marines. They contain, in addition to these directions, carefully-prepared general information about the countries and people to be visited—a sketch of their history, and the latest statistics of their population, commerce, and material progress. Of such matters the ship-master as well as the passengers are too often wholly ignorant, so that works like these will prove a welcome addition to the ship's library, and really stand some chance of being circulated and read. On the technical side, we believe that in no other single work is so much and so accurate information to be found concerning the important rivers which form the Plate estuary as in this of the Hydrographic Office. On the commercial side, it is full of suggestion of profitable ventures. We have little

doubt, for instance, from the statistics of trade with the United States here furnished (and not easily accessible elsewhere) that it would pay to run a monthly line of steamers from New York to Rosario, touching en route at Barbadoes, Pernambuco, Bahia, Rio de Janeiro, Santos, Montevideo, and Buenos Ayres. At all events, it is clear to us that merchants will consult their own interests by studying the publications of the Hydrographic Office, to which and to the Bureau of Navigation we wish a better appreciation and a heartier national support. To the intelligent and energetic chief of the Bureau, indeed, we owe the approaching solution of the problem of an interoceanic canal across the isthmus; and the patient and unassuming labors of our naval officers in this difficult and dangerous survey must ever be regarded as most honorable to our service and to the nation.

—The *Galaxy* for April has a "timely" article by an "Old New Yorker," giving the history of some property on Central Park, and its extraordinary rise in value during the past half-century, which ought to give a little better "tone" to the market and cheer the heart of the depressed speculator. Dr. T. M. Coan contributes an article of more general interest called "A New Country," the new country being the United States. Dr. Coan lifts up his voice to combat the notion that Americans may fairly find in the newness of the country the explanation of or apology for everything disagreeable, ugly, at loose ends, savage, barbarous, or wrong in it. This is, for instance, the familiar explanation of the deficiency in the United States of the fine arts. "Give us age, people say, and we shall create quite as much beauty as Europe has created." In reply to this, Dr. Coan declares that it is a new reproach to cast upon youth that it is deficient in the "creative energies," and suggests that while youth might excuse the faults of a nation in this direction, if the nation were one that had recently emerged from deep barbarism, we in the United States came from the bosom of a high civilization, and profess to have "an equal heritage in the Old World culture." The discussion of this question leads the writer of the article into a hostile excursion into the country of the Philistines, and particularly of the American branch of the tribe, one of whom, we regret to see, is doing editorial writing for *Appletons' Journal*. We fear that satire is a little too delicate a weapon for this gentleman, who denounces Dr. Coan as taking too much interest in the "big and useless buildings" of Europe, and too little in "the stirring and significant facts of the present," and the "living activities of a restless and conquering people"—a people, too, who were "the first to establish the broad principles of civil and religious liberty;" and we have no doubt he will take a savage delight in the shocking story of John Adams's reply to a French sculptor, who requested permission to take the ex-President's portrait in marble. The ex-President's answer was this: "The age of sculpture and painting has not yet arrived in this country, and I hope it will be long before it does so. I would not give a sixpence for a picture by Raphael or a statue by Phidias." The fact is, that the "new country" theory does not explain the absence of art in the United States; but it is not to be left out of the account either. For the development of art in any country the place must be at least old enough to admit of large accumulations of capital, and large numbers of wealthy people having sufficient leisure to give up a great deal of time and thought to matters of taste. This condition has not begun to exist in this country till within a few years, and even now the accumulation of capital steadily devoted to anything above industrial development is extremely small. But even if New York were the centre of exchange for the world, and the United States not a borrowing but a lending nation, there is no certainty that we should see a great artistic period dawn upon our gaze. There have been extremely few artistic periods in the history of the world, and the Anglo-Saxon race is anything but an æsthetic race. Though for that very reason there is every occasion for æsthetic reformers, still it will not do to expect too much from the *moment* or *milieu* alone, when they arrive.

—In a letter to Dr. A. von Frantzius, one of the editors of the *Archiv für Anthropologie*, Mr. C. Rau, of New York, gives the history of the Cardiff Giant ("der Onondaga-Riese"), reproducing the substance of the full exposure of that swindle which was first printed in the *Buffalo Courier*, March 14, 1870, and was very generally copied by American journals. From one of them Mr. Rau cut out the article and preserved it, "to have it at hand as a weapon for overcoming the giant when, some fine day, he should show himself in Europe." "That time is now come," Mr. Rau thinks, after reading, in the last preceding issue of the *Archiv*, Dr. Hartogh-Heys van Zoutwen's paper, in which the giant is recognized as a true "Phœnician Adonis." In proof of the statement that this humbug "did not excite the least interest in truly scientific circles," Mr. Rau gives an extract from a letter written to himself, December 17, 1869, by Professor Joseph Henry, of the Smithsonian Institution:

"It appears that the Cardiff hoax is at length fully exposed. I was unwilling to have the name of the Institution in any way connected with the affair, having had no faith in the antiquity of the statue from the first report of its discovery. Such deceptions ought to be subjected to a more severe condemnation than that which they usually receive in this country."

The article on "Tammuz and the Mound-Builders," in the *Galaxy* for July, 1872, is referred to as a literary curiosity, which may have been only intended as "ein Schurz—a mystification," since "the inscription on the right arm of the statue must have originated in the imagination of the writer."

—In a *Nachwort* to Mr. Rau's letter, Dr. von Frantzius complains that at the last meeting of the American Oriental Society Mr. J. H. Trumbull, as reported in the *Nation* (No. 489, p. 318), stated that "the editor of the *Archiv* supports" Dr. Hartogh's acceptance of the Cardiff giant as a genuine antique; and he asks the correction of a mistake which he justly regards as injurious to his own reputation and that of the *Archiv für Anthropologie* as the organ of a respectable society. Mr. Trumbull authorizes us to say that in this particular he was misunderstood. He attributed to Dr. Hartogh, and *not* to the editor of the *Archiv*, the remark to which the latter takes exception. No copy or abstract of Mr. Trumbull's communication was furnished by him for publication until its appearance in the official proceedings of the Society. He is there reported—and no doubt correctly—as having said that "to this [Dr. Hartogh's] paper Dr. A. von Frantzius, favorably known to American archæologists by his edition of 'Palacio,' appends some judicious remarks. He admits that the discovery of a Phœnician statue in America is very remarkable—if true; but, not being fully satisfied of this, he is not inclined to attribute so much importance as Dr. Hartogh does to the monument." Fully exonerating Dr. von Frantzius from the direct endorsement of this contemptible humbug, we are not the less surprised that a paper in which it figures as a genuine antique, and as trustworthy evidence of Phœnician colonization in America, was permitted to appear in the organ of a scientific association of so high reputation as the *Deutsche Gesellschaft für Anthropologie, Ethnologie, und Urgeschichte.*

## JOHN COLERIDGE PATTESON.*

THESE two books deal with the history of an extremely interesting man. 'The Story of a Fellow-Soldier,' we may say parenthetically, is simply an abstract of the larger work, put into simple language for the use of children—a happy idea, for Bishop Patteson's career is one of which even infant minds may perceive the beauty and impressiveness. Miss Yonge's memoir is a voluminous but extremely careful and intelligent compilation, based almost exclusively upon Patteson's numerous letters. She has done her work with noticeable taste and discretion, and has modestly contented herself with being almost simply an editor. As an editor, she is most exemplary; and where, here and there (as in the first half of her first volume), she is obliged to be a narrator, she performs her task very agreeably. The charge to which her work is most obviously open is that it is written for a particular group of people—for a particular family, almost—and couched more or less in a vocabulary into which the general public (the general American public, at least) needs in some slight degree to be initiated. It is a product of highly conservative Anglicanism, and its tone is the tone of limited local culture rather than of general culture. But this we have not found an objection, and at any rate, if it is an objection, it is essential to the subject. If we are to be brought into connection with conservative Anglicanism—with a circle of people who date their letters on saints' days, and intersperse them largely with D.G. and D.V., who refer freely to the "Octave Services" and "Ember-Week"—we certainly cannot do so on easier and more comfortable terms than those offered us by Miss Yonge. "Dilettanteism," one may often say as one goes, but say it unresentfully, for we are dealing with people whose dilettanteism is highly human and conscientious, and who do a good part of the useful work of the world. John Coleridge Patteson was born and bred in this atmosphere; but he gathered up into his admirable character its most earnest and practical elements, and the career he embraced was such that his native energy and strength of purpose, applied to sordid and wearisome duties, as they often were, and yet combined with a lively and cultivated sense of what one may call the

* 'Life of John Coleridge Patteson, Missionary Bishop to the Melanesian Islands. By C. M. Yonge.' In two volumes. London and New York: Macmillan & Co. 1875.
'The Story of a Fellow-Soldier. By Francis Awdry.' London and New York: Macmillan & Co. 1875.

æsthetics of religion, make him an almost picturesque, an almost dramatic, hero. Add to this that he had the supreme good fortune of those who lose their lives in a chosen cause, and whose image, by this fact, is rounded off with a stroke more effective than any brilliant survival can bestow. His story is a singularly complete and touching one, and needs only to be toned down by time to acquire the holy charm of that of any saint of ecclesiastical legend. It is almost grandly simple; it seems to sweep in a single fine, unbroken curve from its beginning to its end. He was singularly happy in his birth, in his home, in his family ties and associations; in the circumstances of his education and the opportunities of his young manhood; in his early-felt and firmly-grasped vocation; in the sympathy, the hopes, and benedictions under which he embraced it; in the persistent ardor and unfailing faith with which he pursued it; in the visible benefit of his work, which so promptly blessed his labors; and, as we have said, in the honorable martyr-death which crowned them. But other men have had advantages and incitements, and yet have not become eminent. Bishop Patteson's distinction was in an elevation and purity of character so extreme that they remained of necessity in harmony with exalted confidence and liberal opportunity.

He was born in 1827, of an honorable stock on both sides. His mother's family (the Coleridges) has produced an exceptional number of distinguished members; his father, Sir John Patteson, was an eminent lawyer. Miss Yonge gives a very pleasant account of his early years, passed among those happy school-scenes and home-scenes with which English childhood is blessed, and of which Patteson, at Eton and amid his large family circle in Devonshire, had an abundant share. He went to Oxford and obtained a fellowship, he travelled abroad and worked at philology (for which he had an especial fancy) in Germany, then came home, entered the church, and took a living near his own family. He was of a deeply religious disposition, which early showed itself; and yet though a delightfully good boy, he had that rosy relish for sport and deeds of pluck which often so agreeably substantiates one's confidence in the virtuous British lad. His inclination to become a missionary was early developed, and was confirmed by the intimacy of his family with that robust representative of the colonial church, Bishop Selwyn of New Zealand. It was a genuine vocation, an ardent passion, in short, and in this way Patteson was a man of genius. His intellect (save as to the particular faculty of acquiring and retaining languages) was not remarkable, his letters are not brilliant, even his religious views (though evidently a part of the very essence of the man) are not especially comprehensive. His strong point was his character, his personal influence on simple natures, his extraordinary capacity for eliciting affection by extemporizing, as one may almost say, a perfectly sincere manifestation of affection. He was shaped in all respects for a missionary. His dogmatic convictions were simple and unflagging, his temper proof against the weariness of intercourse with childish and barbarous minds, and his skill in practical matters excellent and various. He could do anything in this line from navigating a ship to cooking a supper. He deplores his want of trained skill, but he had by nature all the typical Anglo-Saxon "handiness." All this was put to the test as fully as his largest aspirations demanded. In 1855 he went out to New Zealand with Bishop Selwyn, and remained there and in the tropics until his death in 1871. Those sixteen years were a period of really heroic activity. His field of operation was in the large cluster of the so-called Melanesian Islands, which lie in the Southern Pacific, just within the tropic of Capricorn and some thousand miles north of New Zealand. These islands are almost innumerable and are extremely various in size, in natural structure, and in the character, temper, and language of their populations. The headquarters of the Mission were at Auckland, in New Zealand, where there was a college, and the work was done by a system of annual or semi-annual voyages or rounds of visits from island to island, experimental and tentative in such degree as was necessary. The younger natives, in convenient numbers, were invited to go to Auckland, and were there instructed in the mysteries of the English language and the Anglican theology. Bishop Patteson had use for all his perseverance. The Melanesians, as a general thing, are of a gentle disposition, and extremely capable of clinging affection; so that danger to life in these overtures was not a constant possibility. But the patience, the zeal, the tact, expended in their behalf must have been something incalculable. The reader, indeed, not pledged to explicit sympathy with missionary enterprise can hardly defend himself from a certain feeling of melancholy before the picture of this elaborate machinery—material, intellectual, and moral—for converting unconscious barbarians into puzzled catechumens. He can hardly help regretting that so fine an instrument as Bishop Patteson's personal character and influence should not have been applied to some of the painful problems of our own civilization. This is really, however, a fanciful regret; for the man and the place were a perfect mutual fit, the work elicited the character as none other would have done, and the Melanesian mind, to whatever degree it may have apprehended the privilege of baptism, at least fully appreciated Patteson's intelligent tenderness.

From the moment he left home never to return, his life, his occupations, and his thoughts are copiously and minutely reflected in his letters to his family. Miss Yonge has apparently had an enormous correspondence to select from, and her selection has been comprehensive. It includes a mass of detail which will not interest the general reader, though he will not fail to notice the constant good sense and high feeling of everything that Patteson writes. He writes only, or almost only, about his daily labors, his pupils and proselytes, his multitudinous cruises, his landings (effected in primitive fashion by wading and swimming) upon islands where the appearance of perfect trustfulness had to go hand in hand with constant caution, and about those mild religious impulses which were the lining of all his thoughts. Naturally, Melanesia and his work there absorbed him every year more and more; they became his world; they filled his whole vision, and Europe grew dimmer and more distant. It is hard to imagine a more complete self-surrender to an accepted task. In 1861 his zeal was rewarded by the assent of the English Government to the establishment of a missionary episcopate, independent of the diocese of New Zealand, of which Patteson was consecrated first bishop. As none of the Melanesian Islands are British possessions, Bishop Patteson's spiritual sway was altogether unaccompanied by civil pressure of any kind, but (as he managed it) it was only the more efficacious. The seat of the diocese was fixed at Norfolk Island, half way between New Zealand and Melanesia. The years which followed were busy ones—busy often to extreme weariness. He gave much time to collecting the innumerable insular dialects, but he felt a constant regret that his other duties prevented his putting his great accumulation of material into some scientific order. As it was, he collected an enormous vocabulary, which he has bequeathed to future philologists. In a letter written in 1866 to Professor Max Müller, he gives a really amazing list of daily occupations. He was everything at once—Bishop, student, teacher, administrator, financier, governor, guide, philosopher, friend, and factotum. At this time the practice of kidnapping natives for work in the plantations of Fiji and Queensland obtained a footing, and led to armed resistance and attempted vengeance. Of such an attempt at vengeance, cruelly misdirected, Bishop Patteson was victim at the island of Nukapu in 1871. The white men being in bad odor, he was murdered as the most eminent white man. But he had given the world the full measure of himself, and his career was in a sense complete. As the picture of a character, Miss Yonge's volumes have an interest of a high order. Bishop Patteson was of the stuff of the old-time saints, with a great many virtues in addition that the saints often lacked. He offered an extraordinary combination of resolution and earnestness—of the invincible will and the loving spirit. He is a brilliant figure in the noble class of men whose genius has been a matter of the life itself—whose idea and effort have been a passionate personal example. For the Episcopal Church, of which Bishop Patteson was essentially a product, such a type, such an example, is a precious possession.

## GENTLEMAN FARMING.*

THIS is a tale of enthusiastic philanthropy, agricultural ambition, "inner consciousness," and failure. Mr. Lawson, aged twenty-five, ex-master and huntsman of his brother's fox-hounds, conceived a distaste for sport and an ambition for the advancement of the public good. He had been educated, to use his own expression, "to be happy and good rather than learned or great," and had the prospect of enough wealth to spare him the necessity of earning his own livelihood. Living in an agricultural neighborhood, his ambition turned towards farming, and on making a month's journey in the saddle from Cumberland to London, visiting Mr. Mechi on the way, and becoming infected, as so many others have been, with that vigorous gentleman's enthusiasm, he decided that the best channel for the accomplishment of his beneficent purposes lay in the direction of farming in its highest and most comprehensive form. In the book before us, he has given his experiences with a frankness and *naïveté* that are not often equalled.

He bought a farm of about four hundred acres near the village of Blennerhasset, in Cumberland, and set about the instant development of the most radical improvements. Crooked fences were made straight, small

*'Ten Years of Gentleman Farming at Blennerhasset, with Co-operative Objects. By William Lawson, Charles D. Hunter, F.C.S., and others.' London: Longmans, Green & Co.

fields were made large, old buildings were torn down and new ones put up, and the whole farm was underdrained (five feet deep at intervals of thirty feet) at lightning speed—so fast, indeed, that it afterward proved that in some cases the important item of tiles in the ditches had been omitted. Fully convinced of the superiority of mechanical over animal power, he bought a steam-ploughing apparatus during the early infancy of the steam-ploughing art. He copied Mr. Mechi's system of irrigating by means of iron pipes, hydrants, and gutta-percha hose, and laid down three-quarters of a mile of irrigation-pipes, supplied with liquid manure by pumps driven by a turbine wheel, put in at immense cost. Indeed, he introduced "all the modern improvements" with a vengeance. As a first step in his operations, he found it necessary to select a head man, and, realizing the importance of having a good man for the place, he finally engaged a very respectable person who had for twenty years been his father's coachman, and who had at one time kept a small grocer's shop. On this point he says: "I had not at that time read Stephen's 'Book of the Farm,' in which I now remember that in specifying the qualifications necessary for a shepherd, he shrewdly indicates that, while the shepherd's *honesty* is important, a *knowledge of the shepherd's business* is still more so." The general result of the whole enterprise is very well foreshadowed in this expression in the first chapter of the book: "How during several years I bought and fed animals and sold them at a loss; how I deceived myself and was deceived by others in various ways, can be sufficiently well imagined without being described."

Co-operation became very early one of Mr. Lawson's hobbies, and he rode it unflinchingly to the end with a true huntsman's pluck—taking every fence and ditch that lay in his way, straightening his hat and mounting again after every tumble, but only running his game to earth after all. It was co-operation of the most heroic sort; it was "heads you win, tails I lose." All persons employed on the estate were to receive their wages in any event, and full wages too. Out of the profits of any one year, Mr. Lawson was to reserve a modest 2½ per cent. on his capital; after that a certain percentage was to go to what was called the "public good" fund; and the next dividend was to be allotted not to capital but to the laborers in the form of bonus, in proportion to the wages they had earned. The people at Blennerhasset seemed not eager to avail themselves of the tempting offer. After full discussion in open meeting, the question was put to vote; the voting urns were two bottles, one labelled "co-operation" and the other "every man for himself." Eleven voted—ten for every man for himself, and one for co-operation. Nothing daunted, Mr. Lawson called another meeting, to which he invited not only those immediately interested, but the whole population of the village, male and female, old and young; and here he painted his lily so white, and presented it in such a winning way, that of 53 voters 47 voted for the plan. The success of this attempt at public discussion and decision was so great that it was determined to establish what was known as the Blennerhasset Parliament, where attendance and interest were stimulated by a standing offer of half-a-crown to any ordinary laborer who should produce a valuable idea. It was arranged that the Parliament should sit daily for half-an-hour after dinner; but the discussions were interesting, and a longer time was consumed, and a Saturday meeting from 3 to 6 P.M. was substituted. At these meetings, where every woman or child of the neighborhood might have a voice, the most important questions were discussed and acted upon. On one occasion the question was as to the fitness of the manager for his position; on another, the propriety of mortgaging Mr. Lawson's property for £5,000, in order to invest the proceeds in United States bonds, the decision being in favor of the investment, which was made accordingly. The following question discussed is suggestive: "Whether it is proper for any member of council to molest at any time another member of council in consequence of anything said in council." Of course, in due time, a reform bill was introduced, which contained among others the following clauses: (1.) That part of the horses, at any rate, be sold at once, and the rest put on half corn. (2.) That we let alone the eight cottages (that are as yet only on paper) until we see the other seven filled. (3.) That the farm-bailiff instead of a stick take some work-tool, and, like a man, say "Come" instead of "Go," and that his wages be, after next Friday, eighteen shillings per week. In a certain way the Parliament became an advantage to the community: private grievances, after being duly placarded in the village, were submitted to discussion, and time for reflection was thus afforded before the difficulty was ventilated in open session.

The foregoing, however, were but incidents. The business was carried on with a forethought which required careful estimates of receipts and expenditures to be made in advance, that all might know what could be depended upon as the result of the year's work. For example, the estimated profits for 1867 on the Prior Hall Farm—an estate bought as an addition to the original establishment—had as its chief features:

| | Acres. | Profit per acre. | Total. |
|---|---|---|---|
| Cabbages | 26 | £18 0s. 6d. | £468 13s. 0d. |
| Onions | 7 | 59 17 6 | 419 2 6 |
| Leeks | 6 | 76 7 6 | 458 5 0 |
| Carrots | 4 | 28 18 4 | 115 13 4 |
| Profit on 95 acres remaining | | | 692 16 6 |
| Total profit on 136 acres | | | £2,154 10 4 |

The actual result of that year was a loss of rent, interest, and £252 cash.

If space allowed, we might amuse our readers with the story of the Christmas festivals, at which (Mr. Lawson and his adherents being vegetarians) cold oatmeal porridge and ill-served potatoes and rice were the chief diet, and at which entertaining lectures by phonographers, co-operators, phrenologists, and others supplemented Mr. Lawson's own addresses on America and other countries he had visited; with an account of the hundreds of failures of the original steam-apparatus, the moderate success of the costly double-engine set afterwards substituted for it, and the loss of money on cattle, so great as to impress the vegetarian Parliament with the fact that cattle-raising was a mistake, and induce them to sell out the whole stock at a loss, only to make often greater losses in the cultivation of vegetables on land unsuited for them and in a district where they found no market; with a description of the way in which the sale of milk in the distant city of Newcastle was entrusted to a "good" man, who had been engaged at Bell's Temperance Hotel, and who got drunk and left three days' milk to spoil at the station before the Prime Minister of Blennerhasset was informed of it. In fact, in one sense, it may be said that the whole enterprise from beginning to end was a failure; but in another sense it afforded entertainment to many visitors from far and near, some of whom, being practical men, could learn the value under proper management of many improvements which were there a failure, just as those who are led by its entertaining confessions to read Mr. Lawson's book will find in its supplementary chapters a fund of most valuable original information and suggestion concerning farm-cropping, crop balance-sheets, the effect of manure, the cost of labor, manuring of grasses, experiments with potatoes, etc. Moreover, no one can lay down the book without a feeling of cordial sympathy with Mr. Lawson in his generous and persistent though so often misguided efforts to benefit mankind, and admiration for the faithful, plucky way, in which, for the edification of mankind, he tells without reserve and with a modest good-humor the story of his remarkable experiment up to the time when the farms were sold and the whole account was closed with a loss of some £8,000. Nor can we avoid the suggestion that larger sums have sometimes been expended without producing a result equal to that shown by the permanent improvement of the condition of the working-people of Blennerhasset, and the never-ending good of the education they acquired under Mr. Lawson's ten years of enthusiastic instruction.

---

*Die Lage des homerischen Troja.* The Site of the Homeric Troy. By Dr. Gustavus von Eckenbrecher. With two maps and an illustration. (Düsseldorf: Julius Buddeus. 1875. Pp. 63.)—A flood of new books may be expected on the Troy question. The one named above is not new, but a second corrected and improved edition in book-form of a dissertation originally published in the *Rhenish Museum* in 1842. As the reader will guess, it owes its republication to the interest awakened by Schliemann. The author has, however, purposely disregarded the results of Schliemann's investigations; his aim was merely to state such conclusions as might legitimately be drawn from a study of the ground, and a comparison of Homer and the other ancient authors. It is a full exposition of the argument against the Burrabashi site, and in favor of Hissarlik. Of the two maps, the first represents the changes in the ground since the Trojan times, and the second the Plain of Troy. A view is given in lithograph of the heights of Hissarlik and Tschiblak. The conclusions of the author are not based entirely on passages in books; he has explored the site itself carefully in person.

# The Nation.

*NEW YORK, THURSDAY, APRIL 15, 1875.*

## The Week.

DURING the few days preceding the return of wintry weather on Tuesday, general trade was more active than at any time this year. Breadstuffs and provisions have been in demand both for export and speculative account. Cotton has been quiet, and the advance in the price caused by the light receipts and the prospect that the crop will not exceed 3,750,000 bales, has apparently reached its highest point. Planters are putting in the new crop, and the acreage planted is larger than last year. The business of the railroads is increasing, although the war between the trunk lines continues. It is now a matter of record that the principal lines earned more net in 1874 than ever before; their gross receipts were generally smaller, but the low cost of operating on account of the decline in wages and material made this result possible. Speculation at the Stock Exchange has been tame, although securities and shares have advanced. The Union Pacific speculation, which for weeks overshadowed all others, has been brought to a halt by the Panama Railroad managers, who demand a larger share of the increased receipts growing out of the advance in Pacific-bound freights than the Central and Union Pacific are willing to grant. Very little of this trade will go over the Panama Railroad; but nevertheless Mr. Trenor W. Park, who is the chief manager of the Panama line, wants enough to enable him to declare 4 per cent. quarterly dividends to the Panama stockholders. He threatens, if this is not given, to put on an opposition line to the Pacific Mail. The banks added about $5,000,000 gold to their reserves last week, and are gaining in legal-tender notes. Rates for all classes of loans have a downward tendency. Gold has advanced to 115⅝, and sterling bills are now held at rates which justify the export of gold coin. It seems inevitable that a large part of the gold to come out of the Treasury before midsummer will be exported.

---

The Governor's Canal Commission, consisting of Messrs. John Bigelow, Daniel Magone, J. D. Van Buren, and A. E. Orr, was appointed last week, and the legislative committee has begun its investigations. A bill is now before the legislature to enable the Governor to remove for misconduct in office any secretary of State, comptroller, treasurer, attorney-general, State engineer and surveyor, canal commissioner, or State prison inspector. These offices are now all elective, and the incumbents removable by the simple and familiar process of impeachment, besides being accountable in another way, of which we used to hear a good deal, *i.e.*, to the people. The theory of this sort of accountability is that when an elective officer, like a canal commissioner, misbehaves himself, lines his pockets with the public money, admits fraudulent bids, or indulges himself in any other kind of corruption, the news is brought at once to the people, and the people gather together in their primaries, and in their delegate conventions, and in their county conventions, and in their State conventions, and unanimously resolve that this bad man no longer commands their confidence, and that he, therefore, must retire to private life. As a matter of fact, however, the process is quite different, for no public notice of the bribery and corruption is given, the people never hear of it at all, and the only persons who know anything about it are really the contractors who do the bribing and fraudulent bidding, and the "high officers of State" who connive at it; and so, when the time for the primaries and conventions comes, the contractors and their friends assemble in great numbers, declare themselves to be the people, and very likely pass a series of resolutions recommending the officials for re-election on the ground that they have "faithfully served the interests of the people," and then, as the people, go to the polls and elect the ticket.

---

This system of accountability has been on trial in the State of New York for a long time, and for practical purposes seems to have had as little effect in keeping administration pure as impeachment itself. There can be little doubt that giving the Governor the power of removal would do much good, though, as the *Post* says, the measure does not go as far as it might. If we could have the appointment as well as removal of State officials put into the Governor's hands, we should create the most effective system of responsibility possible under the circumstances of the case. This, however, is impossible without a constitutional amendment, and a constitutional amendment is impossible without recourse to the people, which at present we emphatically protest against. The *Post* says:

"By creating a new instrument of removal and leaving the method of election untouched, it encourages discord and opposition instead of securing unity and harmony among the executive officers of the State. Under the suggested amendment, the Governor would be able to impress his own administrative policy upon the departments. Under the proposed bill he would be brought into conflict with officers having a different policy, representing another party, and elected, perhaps, at a time when there were before the people issues other than those on which he was elected. If the Governor should be clothed with power to remove a Secretary of State or a Comptroller thus politically at variance with himself, the temptation to a questionable exercise of the power might not always be resisted. At any rate, the effect would be to embarrass rather than simplify administration."

But this is just the dilemma we are always brought face to face with by the inflated elective system we have adopted. The people have made the judges or the canal commissioners or the State surveyor elective, only to find that they cannot keep the offices in good hands; then they helplessly ask the Governor to remove them for cause, and in a short time he begins to remove them for "politics." Nevertheless, we are inclined to support the present bill, and for the very reason, among others, that it does encourage "discord and opposition." "Unity and harmony" have been tried a good while, and the more united and harmonious the executive officers become, the more stealing there seems to be. As we write, the measure appears to be undergoing amendment looking towards suspension by the Governor prior to removal after trial.

---

Besides the canals, the great event of the week in local politics has been the pardon of Ingersoll by Mr. Tilden, on the understanding that he is to give evidence against Tweed sufficient to secure a verdict. A new suit has been brought against Tweed for some six millions' worth of real estate, which the old statesman conveyed to himself at the time of the Ring operations, and which has, it is said, since then been conveyed and reconveyed until it is difficult to say to whom it belongs. We fancy, however, that it belongs to the "old man" yet, or that he has some sort of a lien on it, though his lawyers are said to have consumed much of his substance in their efforts to get him out of prison, and to prevent his property from being injudiciously disposed of. It is a hard case, altogether, for no sooner do the lawyers succeed in getting a decision of the highest court of the State in their client's favor, than the Legislature immediately passes a law making it necessary to begin all over again. The Legislature has recently passed two or three bills which will, it is supposed, enable the suit now brought to be carried on to a verdict.

---

During the canvass in Connecticut Mr. Blaine made a speech which is just now serving a purpose very different from that which he put it to. With Colorado admitted to the Union, he said, the total electoral vote will be 369, of which 185 will be a majority. The

South, voting as a unit, can give 138 votes, leaving only 47 to be obtained out of the 231 that belong to the North. The three States of New York, Connecticut, and California can give these votes. "And if this design could succeed, it would only be history repeating itself. Against an overwhelming majority of the Free States, in 1856, a small fraction of them united with the South, and were enabled to fasten the Buchanan dynasty upon the country, with all the unnumbered evils that followed." Since the election in Connecticut, the Democrats have found great satisfaction in reproducing this speech. The united South is, of course, not yet accomplished; but it seems not far off, for South Carolina and Mississippi are the only thoroughly Republican States left in that part of the country, and Mississippi is very uncertain.

The St. Louis *Republican*, in discussing this, remarks that it is a very bad thing that the old sectional division between the North and South should be thus revived It has been plain enough, however, of late years that this was the conclusion to which the policy pursued by the Republicans was leading. The Republican extremists have made, if not the same mistake the Southern politicians did before the war, at least a mistake quite as bad. They are as determined to keep the negro question alive as their old enemies were to prevent its ever coming to the surface, the speeches made in Congress now by such men as Morton, Logan, and Conkling comparing very well for recklessness of statement and partisan fury with the old tirades of Jefferson Davis or Toombs; and the Southern States, as they throw off one by one the carpet-bag governments, go over to the Democratic party. There was a time, as the *Republican* says, when the country was divided between Whigs and Democrats, and not into North and South—when Kentucky, Maryland, Tennessee, Georgia, and Louisiana voted against the Democrats, and it is greatly to be hoped that the time may come again. But the Republicans have apparently determined that they don't want any Southern States on their side in 1876.

We have often pointed out in these columns that the general tendency of freight rates to diminish rather than to increase makes some of the complaints of the Grangers seem ridiculous. They have generally maintained that railroads, being "monopolies," and not subject to the law of demand and supply, could charge pretty much what they pleased. As a matter of fact, however, whenever we have looked into the freight returns of any road, we have been surprised to find that the reverse of this has taken place, and that instead of rates rising they have been steadily decreasing. The history of the Union Pacific for the years 1873 and 1874, recently published, is a striking illustration of this. The Union Pacific is a complete monopoly; that is, its business is free from competition to an extent equalled by few other lines in the world, as it is the only line connecting the Pacific with the Atlantic coast. In 1874, the road earned $616,322 more than in 1873; but, strange as it may seem, the average rate for carrying a ton of freight one mile was reduced from 2.40 cents in 1873 to 2.08 cents in 1874, or over 13 per cent. As the only competitor of the Union Pacific has now come under its control, it will be easy enough to see, by watching its future career, whether it can charge as much as it pleases. It ought not to be forgotten that the transportation tax, so-called, unlike those imposed by sovereign governments, is one which cannot be collected unless business is in such a state that it can be paid, and that therefore building up business by low rates is one of the first and ever-present selfish interests of even the most grasping monopolists.

Mr. Edward Atkinson has published a long review of Mr. Wendell Phillips's financial theories, as they are called, in which he conclusively shows, as has been shown many a time before, that Mr. Phillips is very scantily informed about the rudiments of either finance or political economy. Mr. Atkinson suggests to him that instead of the new kind of greenback which he and other inflationists propose, bearing the legend, "The United States—One dollar" (without any promise to pay), the Government should issue bills with the legend, "one turkey," "one horse," "one pig," or, for small change, "one newspaper"—making them, of course, convertible into 3.65 bonds. This would be an improvement on the present currency, for it would then show on its face, in a plain, straightforward way, that it was "based on the entire wealth of the country." This controversy between Mr. Atkinson and Mr. Phillips has now been going on for some time; but the latter seems still unconvinced. Indeed, we do not see why he should ever be convinced, for he believes that "our late war experience scattered half the cobweb theories that political economists had been spinning for a hundred years." We should advise Mr. Atkinson to end the controversy by refusing to furnish any more fuel to it, because he is really in danger of injuring his own reputation by allowing it to appear that he considers Mr. Phillips qualified to discuss the currency at all.

Mr. Charles Nordhoff has been sending some letters to the *Herald* about the present condition of Arkansas, which are written without any passion or excitement, and with apparent fairness. Mr. Nordhoff finds that with regard to the material condition of the State, it is as good as, if not better than, before the war; that the negroes show no indisposition to work, but generally hire the plantations of the owners in small pieces of land, the rent of which they pay in money or produce. They work better than under the slave-system, and are generally provided with churches and schools. In politics, it does not appear that they have been ostracized by the conservatives, for there are some three hundred colored office-holders of one kind and another scattered through the State, while the enrolling-clerk of the last Democratic House of Representatives was a negro, and the door-keeper of the same body was a *one-legged* negro who had been a Federal soldier (belonging to the class, that is, whom Democrats are supposed to spend their Sundays and holidays in murdering); and the Democrats even nominated a colored man to represent Little Rock in the Constitutional Convention, but his Republican friends "persuaded him," or, as we should say, intimidated him, out of the canvass. More than this, there is a State Civil-Rights Act in full operation which is so much stronger than that recently passed by Congress that Mr. Nordhoff says he was laughed at for asking whether the latter made any trouble. Such disclosures as these make us "realize" what "an age we live in," for it is only six weeks since the same State of Arkansas was on the eve of the most terrible convulsions, and it was generally believed by "leading men" that unless the writ of *habeas corpus* was suspended for at least two years the negroes were a doomed race.

On Saturday the *Tribune* took possession of the lofty new building on the site of its old one, and entered upon its thirty-fifth year. In this twofold event there is much to strike the imagination, and also much to gratify those who have no personal interest in the success of that paper. That the profits of publishing a newspaper are sometimes large enough to permit a heavy investment in building for its own purposes, has been more than once demonstrated in this country; and if there is anything peculiar in the *Tribune's* following, say, the example of the *Herald*, it is that, perhaps more than in the case of any other paper of its class, the commercial side of its business has been subordinated to its public aims. This was, no doubt, the great merit of Mr. Greeley's conduct of the paper, and it will be recognized as the logical outgrowth of his character, both as a man of hobbies, a strong partisan, and one personally above mercenary considerations. The *Tribune* has never made or sought to make money by recklessness or indifferentism in politics, and now that it has achieved an independence of party which its founder hardly dreamed of, we look to see it still preferring the rewards of discharging its duty to the public as a purveyor of news and a leader of opinion, to those which are often secured by sensational and unprincipled journalism. Its past and

present prosperity is proof that such a course is popular and profitable. Reserving itself for its thirty-fourth anniversary, the *Tribune* at last breaks silence about its daily circulation, and shows it to be in round numbers nearly or quite fifty thousand. Of the *Tribune* building it ought to be said that, if it is not handsome, it is imposing, and will be still more so when completed, and that its solid and honest construction throughout make it not only fire-proof in the best sense of that term, but an example of no slight moral value in this age of sham architecture and insurance frauds.

---

A great demonstration has come off in London in honor of "Sir Roger Tichborne," in support of a petition to Parliament for his release from jail, said to have been signed by "about 250,000 persons." An assemblage of people came together, organized under various associations, such as "Magna Charta associations" and "Tichborne relief societies," and forming such a mass as can hardly be got together even when an electoral reform movement is on foot. The procession was about a mile long, and with it were a great many brass bands and banners bearing all kinds of inscriptions, such as "Westminster will never rest till Tichborne is set free," "This is the People's reply to the Lord Chief-Justice," "Set the captive free." The procession was joined by Dr. Kenealy and Mr. Onslow, seated in a carriage drawn by four horses, with two postilions; but the people in the procession soon unharnessed the horses and drew the carriage along themselves. A speech, too, was made by Dr. Kenealy, in which he congratulated the multitude on the orderly character of their proceedings, and declared that he was quite sure that when the assemblage of "half a million" people in London on Easter-Monday, each one of them "as gentle as a child, but as earnest as a giant," was brought to the notice of Parliament, it could not but have some effect. The excitement about the case, whether real or not, does not seem to be on the wane at all, as may be inferred not merely from Dr. Kenealy's harangues, but also from a speech at a public dinner by Chief-Justice Cockburn, in which he referred to the supporters of Orton, not by name indeed, but in ferocious terms of denunciation.

---

A House of Commons Committee on Foreign Loans has been examining into one made by the Honduras Government in 1870, which shows in a most startling manner the ways and means taken by some impoverished governments to provide for their necessities, and also the method of "placing" loans of a doubtful character on the civilized market. The total amount of the loan was £2,500,000, and it was in aid of an unbuilt railway, which no one out of Honduras knew much about; and to float it the revenues of the Government, about which little was known, and that little not favorable, were hypothecated. The loan was supposed to be popular—that is, the whole amount was supposed to be placed on the market to be taken by the public at a fixed price—but an enquiry into the history of £1,000,000 of it shows that, as to this portion, only about £49,000 was really allotted to the public, the remainder being tied up in one way and another by means of all kinds of contracts. The £49,000 was sold at 80, and the remainder, at an average price of 70, produced about £665,000. Of this, financial agents absorbed £182,000, leaving £483,000 to go to the Government with which to complete the road in three years. The annual interest (at ten per cent.), with a sinking fund (at three per cent.) on say £951,000, would have been £123,000 a year. This in three years would have amounted to £369,000, with £114,000 left to build the railway, or, with the proceeds of the popular part of the loan, say £150,000. To obtain this the Government hypothecated its revenues, and undertook to pay £123,000 a year for seventeen years. And, to cap the climax, it now appears that just previous to this negotiation the Government had hypothecated its revenues already for the sum of £4,000.

---

There was no great novelty in these transactions, for in 1867 the Republic funded its part of the old Spanish-American debt by cutting down the principal, and "solemnly hypothecating all the revenues"; and by repeating this, or making equally good pledges at later dates, the debt of Honduras has mounted to the very respectable figure of over £5,000,000, with interest in arrears to the amount of £1,150,533. In Paris the Government seems to have met with some difficulties, for though they offered as usual to pledge the "general revenues of the State and the lands along the railway," the loan offered was "taken up," according to the report made to the Parliamentary committee by the Secretary of the Council of Foreign Bondholders, not by the public but by the police. The £951,000 referred to above were placed on the market by means of a secret contract with a "financial agent," he taking the money in instalments at constantly decreasing prices (thus showing an apparently general understanding of the worthlessness of the loan), and, meanwhile, he undertook to provide interest for the £49,000 in the hands of the public. Honduras credit is not good any longer, and bonds may be bought for 6 which in 1868 were worth 95.

---

In Italy the two chief events of importance of recent date have been the dedication of a monument in Venice to Daniel Manin, and the friendly meeting, in the same city, of Victor Emanuel and the Emperor of Austria. The monument to Manin is a bronze portrait-statue on a granite base, with a bronze winged lion (which is highly praised for its modelling) below. It was uncovered in the midst of an immense multitude on the 22d of March, the twenty-seventh anniversary of the Revolution of 1848. The Government was represented on this occasion by Prof. Bonghi, the Minister of Public Instruction, and M. Henri Martin was the spokesman of a French delegation. A son of the dictator was among the spectators of the honors paid to his father. A fortnight later, Francis Joseph came over from Trieste, and was cordially met by Victor Emanuel in person, and fêted for two days. A grand review formed part of his entertainment. At Rome, Garibaldi continues to be absorbed in his schemes for saving Rome from overflow and malaria, and reviving her commercial importance, and has put out a "feeler" for a loan of $20,000,000 with municipal and other non-state guarantees, for diverting the course of the Tiber and improving the port of Fiumicino. This loan is naturally looked upon with distrust, not only in itself considered, but because of the unsettled state of the whole question of the proper method of accomplishing what the general aims at.

---

The news from Spain is not encouraging. The Carlist defections, it is true, have been followed by Carlist reverses, but the war seems no nearer its end. It continues to keep a quarter of a million of men under arms, and to cost as many dollars per diem for its prosecution. New levies and new loans go hand in hand, and the annual deficit increases with the annual debt. The self-constituted Cabinet which Alfonso found on his arrival at Madrid has been vigorously enforcing reactionary measures after the good old Spanish fashion of bigotry and intolerance. They anticipated the King's arrival by publishing a decree obliging the Government to restore to the Church all its unalienated property then under state control. The civil-marriage bill has been modified, the marriages of apostate priests have been annulled, and the University professors have been forbidden to teach anything contrary to the dogmas of Holy Church. This last decree has led to many voluntary retirements, and caused much difficulty in procuring a president for the University, so that it is even reported that resignation on the part of Liberal professors is hereafter to be punished with exile. How long the ministry will be permitted to go on in this way, and how soon a clamor for the reassembling of the Cortes will make itself heard and respected, remains to be seen. Meanwhile, the industries of the country languish, the conscription goes lower and lower down, and, as the financial engagements and makeshifts of the Government are never published, it is impossible to say how near the brink of ruin and fresh revolution this wretched country stands. For the present, the priests are the masters of the situation, and beyond that nothing is certain.

## THE CONDITIONS OF RADICAL REFORM.

DURING the past four years there has been unquestionably a great unearthing of fraud and corruption, both in this State and in the country at large. A good deal of reformatory work has been done, beginning with the overthrow of the Ring in this city. The Treasury has been cleared of a band of informers and blackmailers, and the Secretary who connived at their performances has been compelled to resign. The Postmaster-General is now engaged in a laudable attempt to rid the Post-office of a band of "straw-bidders" and other impostors and cheats. Governor Tilden is just now occupied in exposing, with every prospect of success, one of the most extensive and well-arranged and most protracted frauds of which any civilized state has been the victim; and the hearty support he is receiving from men of all classes and parties is a very encouraging sign of the times. There is, too, very little doubt that the Democratic House of Representatives will next winter devote itself largely to the work of investigation, and there is just as little that its researches will be rewarded by the discovery of a great many unpleasant things. "The great party" will probably suffer, but the ends for which "the great party" exists will be thereby promoted.

But then, there is one question which we suppose every intelligent man who is watching the efforts in aid of reform is asking himself every day, and the pertinence and importance of which cannot be overrated. It is this: Supposing the city government, the State government, and the General Government, in all their departments, to be rid of their abuses to-morrow—the leaks stopped, and the peculators and the fraudulent contractors and auditors and inspectors and agents punished—shall we then have reached the end of the régime of corruption, and shall we have entered on an era of even tolerable purity and decency and economy? This question is, as we have said, highly important, because the efforts we are making to drive the knaves out of the public service are not worth making unless the result is to be in some degree permanent—unless, in short, we succeed not only in putting a stop to the corruption and particular species of fraud by a particular set of men, but bring about a state of things in which fraud will be less easy and less likely. It must be remembered that the abuses which we are now trying to deal with have been in existence and growing during the last ten years at least, and had reached monstrous proportions before they attracted much attention or roused public indignation; and that they are of such a nature that they cannot be kept down by merely spasmodic attacks on them. The honest citizen has other things to attend to besides the suppression of knavery in public life; the knave, on the other hand, has nothing to attend to except his knavery. Unless, therefore, we can create some better and more constant protection for the public funds than "popular risings," these risings will only act as palliatives, and, be it remembered, will, unless human nature should undergo some great change, speedily cease through weariness. Men, M. Thiers once happily remarked, will die for their country much more readily than they will make iron for it, and, he might have added, much more readily than they will neglect their business to pursue thieves or stand guard over the public treasury.

Now, it must be said in answer to this question that nothing which has been done, is now doing, or which is proposed in the way of reform, promises more than temporary relief. In this State, certainly, some steps have been taken towards permanent improvement, by recent legislation which provides more effectual means of pursuing persons guilty of official misconduct or embezzlement of public money; but then there is a very wide margin, both in State and Federal administration, between complete honesty and the degree of dishonesty which the law can reach even under the most favorable circumstances. Within this margin there can be absolutely no protection against malfeasance, except what comes from a complete change both in the mode of appointing officers and the mode of ensuring their good behavior. This is the only real, as it is the only radical, reform which has come before the public of late years. Its history in General Grant's hands has been so unfortunate as to make it somewhat ludicrous. Most people who speak of it now do so with a smile, and think of it mainly as furnishing a good joke against the Administration; and yet we shall have to come back to it as the only salvation that is offered us. Everything else is a makeshift. There is no use in pouring maledictions on the Canal Ring or the Indian Ring or the Post-office Ring, or any other ring, as long as the civil service is what it is. Rings are the natural products of a system which we have allowed to grow up within a comparatively recent period, the evils of which most of us see, but which we cannot get up courage or energy enough to abolish, and which is gradually undermining the Government. When any gross piece of corruption is exposed, we attack Ben Butler, or Bill King, or Casey, or Bill Tweed, or "Jarv." Lord, or work ourselves into a white heat over their iniquity, but these men are only the natural products of a state of things.

One striking result of the indifference on our part to the real source of our troubles is the failure of all our purely legal devices for the prevention of dishonesty. The civil service was broken down by Jackson for the avowed purpose of stimulating the activity of the "workers" of political parties, and this it undoubtedly does. The principle which he introduced into its management entirely disregards all the guaranties for honesty and efficiency which have their root in human nature, and of which every man avails himself in the transaction of his private affairs. The business of the world, in all fields of private activity, is conducted on the theory that you can only get faithful service by satisfying certain permanent and imperious wants of human nature, such as the desire for security, for comfort and social consideration. The Jackson revolution was accomplished, and its consequences are preserved by the politicians, on the theory that for the proper transaction of public business these wants need not be considered, and that substitutes for them can be found in an elaborate system of checking and inspection. As might have been expected, this notion has been refuted by experience. It has been proved to demonstration that a system of administration which makes no demand on a man's self-respect and love of approbation and domestic affections, and scorns personal honor and *esprit de corps*, is sure to become rotten before long, and to stay rotten until the motive-power is changed; and that the only result of an elaborate plan of checking and inspection in which character plays no part, is that the inspectors join the inspectees in the work of fraud. Wherever we look into the administrative machine, we find that combinations for public plunder are perfectly easy, and that the hindrances provided by law are apt simply to furnish the knaves with an easy exercise for their ingenuity. Anybody who will read the history of the Treasury exposure of a year ago, of the Canal exposure and Post-office exposure now pending, with this suggestion in his mind, will find plenty of illustration of it. In short, the burning question of American politics at this moment is, "Quis custodiet ipsos custodes?"

Another result of the present system, and one perhaps of greater gravity, is the habit of relying on individual men rather than on laws or public opinion for reforms and for protection against wrong-doing. No careful political observer can have failed to notice the growth of this tendency during the last few years. It has now become so marked a feature of politics that it attracts little, if any, general attention, and yet it is worthy of a great deal of attention, for it is the symptom of a subtle poison. The old gentleman who appeared in the Republican Convention in Connecticut the other day, and said that "he had come there to endorse General Grant, and wanted to know if that was what the convention was going to do, for if not he was going home," expressed in a plain, homely way the conception which an increasing number of persons have formed of their political duty. They have apparently abandoned all thought of reliance on the working of the laws under the supervision of a healthy public opinion, and confine their political activity to putting this man here or that man there into office, and then, if they have confidence in the goodness of his intentions, letting him do pretty much what he pleases. We find,

accordingly, wherever a perplexing state of things has to be dealt with, that public opinion is craving some kind of moderate Cæsar to come to our deliverance, and, if he presents himself, is prepared to honor him with truly Gallic trust and reverence, and shudders at the thought of his deposition. We are going through a curious experience of this sort in this city at this moment with regard to the Comptroller, Mr. Green, who was put into office in the midst of the Ring excitement four years ago. He is now supposed to be "standing guard over the treasury," and most good citizens have really ceased to look for any state of things in which he will not be a necessity. They give themselves no trouble about the provision of a government which can be carried on in ordinary times without special providences and by due process of law. They simply thank God for Green, and speculate as to the dreadful things that would happen if we should lose him; and the efforts of "the good men" at Albany are now mainly directed, not to the preparation of a permanent city charter, but to strengthening Green and extending his powers, while "the bad men" work just as assiduously to overthrow Green and oust him. In fact, Green enjoys, on a small scale, the rank and honors of a "saviour of society." General Grant has for some time occupied the same position in the eyes of a considerable portion of the Republican party. That he has been losing it lately is due to his own gross abuse of it. His supporters have indeed passed the last six years, not in trying to lay broad and deep over the whole Union a government of laws which shall be independent of the wisdom or folly of individual men and serve the needs of many generations, but in persuading themselves and persuading others that he was necessary to the national salvation. As a consequence of this doctrine, not only has rational, far-seeing legislation been neglected, but his errors of every kind have had, as a necessity of the case, to be justified, and even applauded, with infinite detriment to public opinion and infinite hindrance to healthy political life.

## THE STORY OF THE FREEDMAN'S BANK.

ON the 2d of March, 1865, in "the last days of the session" (so fruitful of national misfortune in this country), Mr. Sumner reported to the Senate an "Act to incorporate the Freedman's Savings and Trust Company." Mr. Sumner said in explanation that it was "an ordinary savings-bank charter," and that it contained "no extraordinary privileges." Mr. Buckalew, of Pennsylvania, who had considered it in committee, also said that the bill was "in proper form," that "the form was unobjectionable," and that the only question was whether Congress should charter a savings-bank to do business outside of the District of Columbia. Mr. Powell, of Kentucky, objected more strenuously to the bill upon this ground, and then Mr. Sumner, who characterized it as simply "a measure of philanthropy," replied: "Let it be limited to the District; let the amendment be made by inserting after the words 'body corporate' the words 'in the District of Columbia.'" Mr. Powell subsequently moved to amend the title of the bill by adding "in the District of Columbia," and then the bill passed.

On the 3d of March, 1865, the last day of the session, the bill was taken up in the House. Mr. Ganson, of New York, enquired where this savings-bank was to be located, and Mr. Eliot, of Massachusetts, who had the bill in charge, replied, "in Washington." Mr. Ganson said that it was not so stated in the bill, and Mr. Eliot thereupon moved to amend by adding after the words "body corporate" "in Washington City, in the District of Columbia." He also moved to add to the list of corporators the name of Salmon P. Chase, and both of these amendments were adopted. In the last days of the session, many things are done which were not supposed to be done, and, conversely, it would seem that some things are supposed to be done which were never in fact accomplished. The amendment of the title, which Mr. Powell moved in the Senate, and the addition of the late Chief-Justice to the list of corporators, which Mr. Eliot moved in the House, though carried with entire unanimity in each, seem never to have been acted upon by both Houses, nor to have been the subject of a conference, but in some mysterious way to have slipped out of the enrolled bill. What the Journal may show, we do not know, but the reports of the *Globe* shed no light on the missing items.

This "Act to Incorporate the Freedman's Savings and Trust Company" was, then, simply a charter to establish a savings-bank in the city of Washington. Nevertheless, there is this remarkable fact to be found at its threshold, that, while it was to be a savings-bank in the District of Columbia, none of the corporators named in the bill resided there. The list of their names would justify Mr. Sumner's assertion that the bill was simply a philanthropic measure. It contains the names of some of the most eminent citizens of New York—such names as Peter Cooper, William C. Bryant, A. A. Low, S. B. Chittenden, Charles H. Marshall, William A. Booth, Gerrit Smith, John Jay, Hiram Barney, Seth B. Hunt, etc., etc. The representation from Boston was equally creditable: John M. Forbes, William Claflin, S. G. Howe, George L. Stearns, Edward Atkinson, A. A. Lawrence, etc. The list also included citizens of Rhode Island, Pennsylvania, and Ohio, and these gentlemen from these five States and "their successors" were constituted a body corporate in the city of Washington.

Whether the names of any of these gentleman were inserted with their own knowledge and consent, whether they ever gave the guarantee of their good characters to the ignorant and trustful depositors who were to become the patrons of this institution, we do not know. A charter reported "in the last days of the session," and passed through both Houses in about forty-eight hours, has not much chance of being published *in extenso*, and of thereby being brought to the personal attention of everybody who may be honored by being named as an incorporator. It is not for a moment to be supposed that either Mr. Sumner or Mr. Buckalew ever lent himself to an unworthy operation connected with legislation, and they were really the chief sponsors of this measure. Yet the assertion of Mr. Buckalew that the bill was "in proper form," and that the form was "unobjectionable," hardly seems justified by what we now know of the institution. There was no personal liability on the part of the trustees provided for by the bill, and there was no provision for official reports by the trustees, and there were no means provided by which depositors in the city of Washington could reach, if need be, these foreign non-resident corporators; but it is also due to Mr. Buckalew to say that no great harm was likely to arise from the bill as it passed the Senate, for the only power given to the corporators after they had received deposits, was to invest "the same in stocks, bonds, Treasury notes, or other securities of the United States." That a savings-bank thus limited to securities which did not pay 6 per cent. could not promise its depositors a very large return for their money is apparent, though the securities, on the other hand, were excellent and always readily available.

Whether the eminent body of the corporators ever assembled at Washington we do not know. Some of them undoubtedly must have done so, if only to select their "successors." The charter provided that the persons named therein should be the first trustees of the corporation, and that all vacancies should be filled by ballot, and that at least ten votes should be necessary for the election of a trustee. Therefore, we may conclude that ten of these corporators really assembled to organize the Freedman's Savings Bank, to set the machinery in motion. But the charter also provided that the trustees should hold a regular meeting at least once in each month, and we may be allowed to doubt whether the corporators from Boston and Ohio travelled frequently to attend these meetings, and to infer that their "successors" very speedily came into the control and management of the institution.

Be this as it may, the Freedman's Bank lived, and, to a certain extent, succeeded. Its principal office was in Washington, but it established branches at thirty places in the Southern States. By what right it thus did business beyond the District of Columbia we do not know. Certainly the charter did not confer such a power, and certainly it never contemplated the transaction of business without power. Congress had not assumed to confer such authority

which might conflict with the statutory precautions of the several States, and we see no reason why South Carolina could not treat one of these branches like a foreign corporation coming within its borders. If, for instance, Congress should charter another savings-bank, and that institution, composed of foreign corporators and directors, should again walk into New York and attempt to fleece our poorer and more ignorant classes, we suppose no one would question the right of the State to interfere and exercise at least a scrutiny to the end that it might protect its own citizens. But in the prostrate South there was in fact no one to take any such measures of precaution; and this body corporate, appearing and soliciting deposits under a charter from Congress, really seemed to the fallen and to the ignorant classes there as if it were the embodied power of the National Government, and that calling it to account would be regarded at Washington as the inception of another rebellion.

But when the business of establishing branches and receiving deposits had gone on for five years, and a large amount of money had passed under the control of the "successors," the original charter was found too narrow for the successful investment of the deposits, and humanity required that the unfortunate freedmen should receive a higher rate of interest. In April, 1870, a short amendment to the charter was reported to the House by Mr. Cook of Illinois. It merely provided that the trustees might invest in mortgage securities, and might hold and improve the real estate owned by the bank in the city of Washington. The amendment passed the House without objection, without debate, and, it may be inferred, without consideration. In the Senate a single speech was made upon the subject, which we transcribe in full, both because it embraces in itself the entire debate upon the subject and because it has proved to be a remarkable prophecy of the fate of the Freedman's Bank:

"This amendment of the charter of this company I objected to some time ago. I think it will in the end probably destroy the institution. But the people concerned in this amendment, and those most interested, the colored people, have written to me remonstrating against my course, and if they want to be cheated I do not know that it is worth while for me to make much trouble about it. It is a principle which ought not to go into any banking institution at all. It is endangering the depositors of the funds, the small depositors especially. They are in the hands of persons entirely irresponsible, except the responsibility given by their character. They will be led probably into speculations, and if this money is once invested in real estate it will be very difficult to get it back. My experience has been that whenever institutions of this kind have invested their money in real estate they have gone to destruction."

It would probably puzzle our readers to tell from what Senator this single note of warning fell, and to save them the trouble we will add that it was about the last one that would be guessed—Mr. Simon Cameron. When the Amendatory Act finally came up no one said anything, and it passed. The "successors" were then practically, though not nominally, the same set of men who were getting all kinds of legislation for the District of Columbia, and very little was said in Congress against anything which they wanted.

The remainder of the story is very soon told. In 1873 a National-Bank examiner, under instructions from the Comptroller of the Currency, examined the books of the Freedman's Bank and reported its affairs to be unsatisfactory, and pointed out a number of irregularities which might well have been characterized first as last as so many robberies. In 1874 another examination was held, and the concern was pronounced insolvent. A feeble attempt at reorganization was made, and then the bank collapsed. In four years after the Amendatory Act passed, a beneficent and useful institution, which might have pursued a well-beaten business path, was ruined; its assets, intended to be the safest known to a business community, practically worthless; and several millions of money taken from the savings of the poor hopelessly squandered. And in little less than a year from the time that the insolvency of the bank became known—such was the involved and atrocious condition of its affairs—none of its wronged and needy depositors has received a cent. Finally, no one responsible for the iniquity has been hung by the mob nor prosecuted by the officers of the Government. The leniency of the former occasions some astonishment; the inaction of the latter awakens no surprise. The President's district-attorneys in Washington would no more think of indicting the trustees who lent freedmen's money to members of the ring on Seneca Stone stock, than they would think of indicting Governor Shepherd or the President, or of indicting themselves.

In looking over the schedule of the assets of the bank, one cannot but be struck with the very audacity of the lawlessness which characterized the management. Instead of United States securities and "first-class" real-estate mortgages we find chattel mortgages on furniture (and in one case a loan of $50,000 on such a mortgage), chattel mortgages on paintings, on jewellery, on groceries, etc. etc. Seneca Stone Co. stock takes the place of land in an item of $75,000. One young gentleman, a protégé of the late Cashier Huntingdon, obtained several thousand dollars on the stock of a Metropolitan Paving Company, an American Seal-Lock Company, and the Capital Publishing Company. The real-estate loans are, in part, on country property, on plantations, on lands in the South which cannot find a purchaser and had no "cash value," and on a "forest tract." Of the "bonds, Treasury notes, and other securities of the United States," supposed to be the chief basis of investment, we find only four hundred dollars. Any description of "wild-cat" collateral seems to have been satisfactory security for the unfortunate freedmen's savings.

If it had been in the power of the Government to pay these poor wronged creatures, on the morning after the Freedman's Bank failed, it would have been national economy so to do—not because of the private injustice and individual suffering which the failure caused, but because of the widespread demoralization which went with it, and the blighting of so much good seed which had been providently sown. It was not the case of one of a dozen saving-banks failing in a great city, occasioning loss to a small fraction of the community, but of a single institution which had spread itself over a vast region of country, and acquired the solitary confidence of an entire race. The evil, however, is done and cannot be undone now; and it consisted not in the loss of money, but in the destruction of confidence. At the close of the war we had on our hands a new acquisition of several millions of people, poor, ignorant, and inexperienced, who desired to rise, and who gratefully looked up to the Government in absolute trust for protection and guidance. We told them that they must study and work and save as white men do; that "if a man saves ten cents a day for ten years, and keeps it at six per cent. interest in the Freedman's Bank, he will have $489 31," and that this "benevolent institution is under the charter of Congress, and received," so said the bank-books, "the commendation and countenance of President Lincoln." After allowing this to go on several years we leave them with the practical conclusion in their minds—the women, that it will be the part of wisdom hereafter to keep their savings without interest in an old stocking; the men, that it will be philosophical to take their savings and get drunk on them.

It seems to have been the fate of the Republican party since the end of the war to legislate nothing for the South but trouble and misfortune; to set up State governments and hand them over to outlaws and robbers; to create a "benevolent institution" and turn it into an instrumentality for transferring black men's money into white men's pockets. Yet, nevertheless, such is the dangerous simplicity of ignorant, unintelligent voters, that it is now possible that this very class of cheated and neglected depositors will vote solidly, in the next Republican convention, to break down the barrier of common consent which has restrained all parties for the last seventy years, and force the issue of a third term upon the country.

## THE FUTURE SENATE IN FRANCE.

PARIS, March 26, 1875.

WE have been led out of a provisional Republic into a provisionally Conservative Republic. It would be idle to say that a permanent government has been formed, but the constitutional work is ended, and I

should like to-day to analyze its features, which in some respects are very original. First of all, it must be borne in mind that the Constitution, as it is, is subject to a continual revision, and this revision is not subject, as it is in America, to conditions which are difficult to realize. A mere majority of one in the Lower House, and a majority of one in the Upper House, can provoke the revision of the whole Constitution ; and it was said with much emphasis at the tribune by the framers and reporters of the new laws that this revision had no limits—that it did not mean simply revision in a more republican sense, that it included a change in the form of government, and did not exclude a return to a monarchical form of government. The elasticity of the revision clause and the facility of the revision, which is made simply dependent on a parliamentary majority of one day, give to the new Constitution one of its peculiar characteristics. Hitherto, all our framers of constitutions have worked for eternity ; they have all exclaimed, "Exegi monumentum ære perennius." Our new Sieyès have been more modest, partly because without this revision clause they never could have obtained the votes of the wavering Monarchists of the Chamber, and also because they have less intrinsic faith in the virtue of words and parchments.

But to me the most original feature of the Constitution appears to be the Senate. The creation and nomination of an Upper House have always been one of the great difficulties of parliamentary government. It is fortunate for England that its House of Lords represents something which speaks very vividly to the imagination of the people ; it is the senate of a great landed aristocracy, and is full of names, each of which is connected with the greatness and glory of Great Britain. In America the Senate represents the independent existence of the States—it is a Congress of ambassadors ; and I remember when, in Washington, I was looking over a little book on the etiquette of your political capital, how much I was struck by the care the original framers of these rules of etiquette took to establish, as it were, the diplomatic dignity of the Senators. All our attempts to form an independent and active Senate in France have been failures. There was much dignity in our Senates—they were Houses of what we call *illustrations ;* but as these *illustrations* were the nominees of the sovereign, under Napoleon III., as well as under Louis Philippe, they had no political independence. There was no young blood in them ; it is difficult to become an "*illustration*" before old age arrives, with its accompaniment of fatigue, of disillusions, and of gout. An old admiral is not worth much on the benches of a senate, though he may still hold his place on the quarter-deck. Old generals are notoriously given to sleep or to diffuse and profuse eloquence. Sainte-Beuve never felt quite at home in the Imperial Senate. On the famous day which marked the downfall of the Second Empire, the Senate met as usual in its quiet palace of the Luxembourg. The Senators were very grandiloquent, and prepared to die on their curule-chairs, like the old Senators of Rome when the Gauls entered the city. The Gauls never came ; the Senate was as well forgotten by the Revolution as if it had never existed. On the 5th September the Senate was no more, and the Senators were still alive.

The Lower House represents in principle the population, the number, the living passions of the time. What will our Senate represent ? It was thought at first that a good plan would be to represent the departments, and to give two Senators to each, which would have made in all about 190 Senators. The Department is an artificial creation of the Revolution, it is not founded upon old traditions, old charters ; it does not take into account the geological character of the natural regions of France ; it has not a feudal and material origin, like the old *province.* Nevertheless, it has now existed for nearly eighty years and it has assumed some reality. What has more than anything contributed to give vitality to the department is the financial question. You cannot deny the existence of a man who has debts, and our departments are plunging into debt as much as the State will allow them, in order to make railroads and improvements of all sorts. The budget of a department has become something rather respectable, and the Councils-General are allowed to discuss this budget yearly. Why not, therefore, represent in the Senate those divisions of France which have assumed life and reality ? It would give importance to the great landowners, as they are the class which fills the Councils-General. This mode of representation was the one which I preferred, and which I have always advocated. I doubt whether it would have excluded many of our "*illustrations,*" as most of them are members of the Councils-General in their departments. The plan which has been adopted does not exclude the Councils-General from the nomination of the Senators, only they will find themselves completely swamped by the great number of Senatorial electors. And who are those electors to be ? Each *commune* (township or village) will name a delegate, and these delegates will meet with the Councillors-General and the Councillors of each arrondissement (the arrondissement is a subdivision of the department) to name the Senators of the department by secret ballot. The number of the councillors of arrondissement is just the same as the number of the Councillors-General, as each canton names one councillor of each sort (the canton is a subdivision of the arrondissement). The number of electors who will vote in virtue of this title of councillors will be to the number of the communal delegates as one to thirty, forty, or fifty, according to the distribution of the population in the villages.

There is much obscurity as to the character of the future communal delegates. The work of centralization has been such in France, and the pressure of the Administration on the communal districts is so powerful, that in all the rural and conservative districts the communal delegates will in all probability be the indirect nominees of the prefects. These functionaries will practically have the nomination of the Senators in their hands. It will be quite the reverse in the manufacturing districts. The revolutionary spirit will there be felt in the election of the communal delegates as well as in all elections. But the feature on which I must insist is this : thus far all governments, whether republican or monarchical, have made it their special object to exclude politics from the quiet field of administration. Even the Councils-General, though they resemble somewhat a small parliament, are only allowed to discuss questions of finance and administration ; they can pass resolutions on matters connected with political economy, and yet they cannot express a political wish. The prefect, who is always present during the discussions, uses his power of veto as soon as a member transgresses these rules. The boundaries of discussions are even more narrow in the municipal Councils ; even in Paris the municipal Council, though it is almost entirely composed of very advanced republicans, is obliged to limit its sphere of action to administrative questions. The new Senate law is a movement in an opposite direction : it goes against the oldest and most inveterate traditions of the French policy, and it converts the 36,000 municipal Councils into small political arenas, for these Councils will now have a right to take a part in the nomination of the legislators. It is quite clear also that in consequence of this law the elections for the municipal and general Councils will become political elections, which they have never been, except by accident and in the largest towns in France. The electors will make their choice in view of the nomination of the Senatorial delegates and of the Senators ; each councillor will be named with the understanding that he will vote for such or such a Senator.

The consequences of this revolution—the word is perhaps not too strong—will, of course, only be felt in time. Whether they will be good or bad, it is difficult to say. One thing must strike the student of French history since the Revolution : it is the comparative quietness, the constant prosperity of the country under the most opposite, and sometimes the most adverse circumstances. Much may be said against centralization and its effects on the character of the nation; it can hardly be denied that there are few countries where the machine of administration runs more smoothly, where there are fewer abuses, where the citizens are better protected in their interests and in their rights. Paris may be turbulent, its palaces may be burning, the mob may rule in the Tuileries—the machinery of government goes on in the provinces. The prefects are the agents of tradition, of routine if you like ; but this routine is such that no small municipal corporations can oppress or overtax a population, can squander the communal property, can make dangerous leases. The Councils of the departments and of the cities are as quiet as the law-courts. The instinctive desire of most Frenchmen is not to meddle with politics ; to lead under the protection of good laws a genial and laborious life. They are very jealous of equality, but life does not appear to them as a perpetual struggle between conflicting parties. The Senate law will therefore introduce a new disturbing element in the smallest villages ; it will be so at least if the law is at work for a number of years, and if the Senate becomes as active a body as the Lower House. But then comes the question : Will this new Senate named in this fashion really have more vitality than the other Senates we have known ? What will it represent ?—for real strength must be a transmission of motive power. I confess that I cannot answer this question. I seek in vain a meaning in a representation of the 36,000 communes of France, great and small. Why is the representative of a State in America an important personage ? Because a State is an important force in itself. What force is there in the typical Commune, a church, a school, a burial-ground, a few houses, a collection of poor laborers, working from sunrise to sunset? To represent Paris, Lyons, Bordeaux, Marseilles, means something ; to represent a village means nothing if you do not take the atomic view of society which was taken by the revolutionary *Commune.* The Communist's ideal was to make every Commune sovereign, to destroy all hierarchy in society ; they adopted in politics the Congregationalist principle—at least if there was any meaning in their theories. Take a

number of people collected by chance round a few trees or inside some walls, and say to them : "You are a nation, a state, a community. Frame your own laws ; be your own army and defend your independence. Let no voice come from the outside and dictate orders "—this is the *Commune ;* but this molecular view of society hardly deserves to find encouragement ; and I am afraid that our Communal Senate is an unconscious sacrifice to it.

"Quos vult perdere, Jupiter dementat." There is not much political wisdom in our poor, tired Assembly. A man sprang out of the great abyss of things unknown ; he had written long and tedious books on history, and had not much understood history. He said to the distressed Chamber, "I have a plan," just as Trochu told the Parisians during the siege that he had a plan. And the Chamber adopted the Wallon plan before it fairly understood it. The psychological moment had come ; there was but one word in everybody's mouth : Something must be done. Well ! something has been done. Time will show how the new Communal electoral body will work and understand the interests of the country. There is a general belief that the new Senate must be conservative, and that it will be a useful check on the Lower Chamber. But I have talked with several prefects on the question, and I have not yet found one who could tell me with any degree of probability how the Communal electors will combine their action and how they will vote.

## SWISS AND AMERICAN POLITICS—A PARALLEL.

GENEVA, March 1.

I FIND the very reasonable feeling prevailing among thoughtful and studious Swiss politicians that there is no department of foreign history so important to them as the political history of the United States. If a like interest prevails in America in the study of Swiss political history, there is henceforth no difficulty in satisfying it. The long course by which the Swiss Republic has progressed (do we say *progressed* in the *Nation ?*) "from feudal to federal," and one or two steps beyond federal, is fully described in the work of M. Antoine Morin, of Geneva,* which is just completed down to the adoption of the Constitution of 1874. The venerable author is well known in his own country as a political writer, and especially as one of the earliest proposers and advocates of proportional representation. But in this work he restricts himself with great simplicity to the office of annalist and compiler. The result is a straight, plain story, attractive to any one interested in the subject, and, with its great array of *pièces justificatives,* very convenient for reference.

It is impossible to read this story without being struck again and again with the closeness of the parallel between Swiss and American political history. The scale of time is greater in the Swiss story, and the dimensions of space are greater in the American. Of course, these are not the most important differences, but really they are the most obvious. In both cases the confederation of the several republics was generated by the exigencies of common defence against foreign force. And in both cases, by a singular paradox, the confederation which originated in common interests has been consolidated and centralized in consequence of mutual alienation and civil war. In fact, it was not until after the war of the Sonderbund—so curiously similar, in some of its features, to our war of Secession—that Switzerland passed from the condition of a federation of States into that of a federal State. There can hardly be a more mortifying contrast for an American student than that between the war and reconstruction policy carried through to success in 1847, by the grand old Genevese soldier, General Dufour, and our recent and present miseries. But in both cases a great and increasing momentum towards centralization seems to have been the manifest and necessary consequence even of a civil war carried on in the most fraternal spirit.

Here, as well as at home, the decline of "the brave days of old" is dated, by men of this generation, from about the peace of 1815. The reminiscences of elderly people looking back to the fine old silver-gray party that used to elect and re-elect its candidates unquestioned, and their complaints of the Catholic vote and of too much universal suffrage, remind one irresistibly of old Connecticut. And that curious phenomenon, observable in all latitudes and longitudes, under the most diverse circumstances—the attraction of cohesion between the Roman Catholic clergy and the representatives of red radicalism—has had quite as interesting a part to play here as in America. It has given the control of politics, now these many years, into the hands of the "radical-liberal" party ; and when, two or three years ago, the coalition dissolved in a quarrel, and the confederate factions attempted to pull asunder, it was found that political ties were stronger than ecclesiastical ; for the Catholic party, in coming off, left more than half its voting force behind it in the radical ranks.

Of course the progress of these changes has given happy opportunity for the development of the "statesman." Geneva has had her Tweed and Wood combined in the person of James Fazy, tribune of the people, and hero of some bloody barricades and street-fights nearly thirty years ago. It must be confessed that the Geneva "statesman" (he still survives—*vivit ! etiam in Senatum venit !*—and is pointed out to strangers from the gallery of the *Grand Conseil*) is of a less gross and vulgar type than our own indigenous Tweeds. He is a doctrinaire, and addicted to political economy ; and while friendly to a large scale of public expenditure, involving the dispensing of contracts to men of the right style of patriotism, he has a hearty and intelligent interest in advancing the system of public education. In fact, it is curious to see how large a function in the art of politics is fulfilled in this little republic by the public-school system, which is in many respects so admirable. It has been discovered that the corps of public schoolmasters and the reigning political party are able to exchange very valuable reciprocal services. The number of teachers and professors in high political positions is such as to make the Opposition denounce the existing *régime* as a tyranny of schoolmasters. Perhaps it is better that this relation to the art of government should be occupied by the public-school system than, for instance, by the retail whiskey trade—and perhaps not ; it is a delicate question.

Americans will do well to ponder the fact that in this confederation, in which the principle of States' Rights has been asserted and maintained for centuries with the utmost jealousy, the advanced party of constitutional revisionists are now openly contending for the complete consolidation of the States under one central government. It is the natural result of too much States' Rights. In the long run a small amount of practical inconvenience and constantly recurring annoyance will tire out the liveliest of historic feelings and the staunchest of theoretical arguments out of De Tocqueville. It has been the pestering variations of commercial law, the ecclesiastico-legal hindrances to marriage and burial, the restrictions on the liberty of worship, the limitations on the right of citizens of one canton to settle in another, that have pushed the Swiss people so far along in the way towards consolidation—a way in which they have certainly not yet come to a full halt.

The religious question is now assuming its most trying and painful phase—for it has touched upon the tenure of real estate. Those who prognosticate a conflict with the Roman Catholic Church in America may save themselves any anxiety as to the emergence of any such real-estate difficulty there. For (as the author of the articles on "Our Established Church" showed ten years ago in *Putnam's Magazine*) all possibility of division within the Church, or between the Church and the state, as to the control of the magnificent estates of the Church-property, is prevented by making these the private property of the person acting for the time being as bishop, and by making him absolutely dependent on the Pope—*amovibilis ad nutum.* The local governments of Geneva and Berne, in their gifts for the benefit of Catholic church-edifices, have shown a less generous confidence than we in America, and provided that the churches built on their land, or with the help of their money, should be con rolled, not by the hierarchy, but by the Catholic citizens. In both these cities the Catholics have elected liberal boards of trustees for the two splendid churches lately built ; and these trustees say that, at hours when the buildings are not needed by the present occupants, they may be used by the Old Catholic clergy and people. This is spoliation and desecration. Accordingly, Curé Perroulaz, at Berne, declares to the Government that it is impossible to celebrate the holy mysteries in a building desecrated by schismatic priests ; and, with beautiful consistency, says his Mass henceforth in a public ball and concert room, while waiting for permission to share with his Calvinist fellow-citizens in the accommodations of a Protestant meeting-house. This is a mild type of martyrdom. But it will be made the most of. Before this letter reaches you a moan of lamentation will have come to you by telegraph over the spoliation of the Geneva Catholics and the desecration of Notre Dame. The new trustees have invited the Ultramontane clergy to continue in charge of the church, only allowing the Old Catholics to use it, when needed, for baptisms, marriages, and funerals—an invitation which will undoubtedly be declined, if it is so fortunate as to get any answer at all.

It is impossible for a calm outsider to work himself up to anything like an anguish of sympathy in this case. Even the Conservatives, whose constant duty it is to object to all the proceedings of the Administration, shake their silver-gray locks with mitigated reprobation, remembering the time

* 'Précis de l'Histoire politique de la Suisse depuis l'Origine de la Confédération jusqu' à nos jours. Par Antoine Morin.' 5 vols. 12mo. Paris : Sandoz & Fischbacher.

when the Radical party was first built up by the Catholic vote, and remark that it was the Ultramontanes themselves who cut and trimmed the switches with which they are now getting so soundly flogged.

## HOW PICTURES SHOULD BE FRAMED.

To the Editor of The Nation:

Sir: The means of communication between the two continents are swift and varied, but they are as yet inadequate to an interchange of thought on less than vital questions. I have just read an art criticism in the *Nation* of the 4th of February, and my apparently tardy answer may seem to your readers singularly inappropriate. Permit me, for the sake of intelligibility and for the benefit of those who may not have seen the article in question, to make the following extract:

"We have never understood why the coast-scene of Hoguet, say, or Kuwasseg, when executed in oil, must be thrown back in a very deep frame, with the look, if it is small, of being seen at the end of a sort of golden tunnel; while the same scene, if we suppose it copied in water-color with exactly the like chiaroscuro and value, must be thrown up to an entirely different focus, surrounded with the flattest of slats, and blind-haltered with a blazing space of raw white all around it, somewhat suggesting in the whole arrangement the iris of a near-sighted eye."

Artists are not so arbitrary as the critic fancies in the framing of their pictures. Everything has its reason, as has likewise the gold relief, or the flat passe-partout. Our critic in somewhat violent and unintelligible terms asks us why we must frame our water-colors on white grounds. I will try to enlighten him. The first object of a frame is to separate the picture from surrounding objects; the second is to enhance the drawing and color; the third is ornamental. Now, a white passe-partout will separate a water-color from surrounding objects as well if not better than anything else, and the critic himself in another part of his article confesses that it is very ornamental. The question of its effect upon drawing has not been broached, so that it only remains for me to discuss its effect upon color.

Color must be considered with reference to both its value and intensity. By value I mean its relative lightness or darkness; by intensity, its relative purity. As the great charm of an aquarelle resides in its transparency, which is only acquired by a thin wash or washes, in order to avoid an appearance of weakness, our chief aim in the selection of a frame must be to give it strength, or, in other words, to raise its value. What will most strengthen it? White, of course. Now, as to intensity. Should any one color predominate, or should the picture be of a decided tone, it might be advantageous to tint the frame with the complementary of that tone or color whose intensity would thereby be augmented; but in so doing we must always bear in mind that the lighter the tint, the less its intensity-raising power, and the darker the tint, the less its value-raising power. It is a well-established fact that white, in a high degree, almost as much as a complementary, is favorable to a color, and white alone is favorable to all colors; as Chevreul truly says, it has a remarkable influence "in raising the tone (*i.e.*, value) and augmenting the intensity of the color adjacent to it." The respective merits of the white and the tinted frames may be briefly summed up as follows:

*All* white frames raise in the highest degree the value of *all* enclosed colors, and in a high degree their intensity, though less than a tinted frame under certain conditions.

*Some* lightly tinted frames raise in a higher degree than white the intensity of *some* enclosed colors, and in a less degree their value.

*Some* strongly tinted frames, though they may raise in the highest degree the intensity of *some* enclosed colors, are so prejudicial to their values that they cannot be taken into account.

For this reason, too, gold frames without an intervening light border are prejudicial to aquarelles. Any one who has ever seen an exhibition of water-colors where want of space has vetoed the interior margin instead of limiting the number of pictures, cannot fail to have noticed the disastrous effect of such a short-sighted policy. Assuming for an instant, what I shall shortly endeavor to establish, that the flat passe-partout is the most advantageous to water-colors, the limited range of colored cardboard would in the majority of cases prove a serious obstacle to the selection of the complementary required.

Oil pictures do not look well in white frames. Strength being one of their characteristics, they need no violent contrasts to render them more vigorous. Such, too, is the nature of the materials and the mode of applying them that the brilliancy of the white causes the contiguous colors to appear dirty—an appearance which can be counteracted to the greatest possible extent by surrounding them with black. As a general rule, however, gold frames are the most favorable. The reflecting power of their metallic surfaces creates a subtle harmony betwixt them and the picture.

The critic says that he does not understand why the coast-scene of Hoguet, when executed in oil, must be thrown back in a very deep frame, while the same, if we suppose it copied in water-color with exactly the like chiaroscuro and value, must be surrounded with a flat, white passe-partout. I will preface my answer by saying that there is a class of paintings called decorative paintings, and for these, when executed in flat tints, a flat frame is most appropriate. For economy's sake, likewise, or for modesty's sake, artists sometimes select the low frame for their sketches. With these exceptions, the deep frame is almost invariably preferred, and not without reason. We have just seen that the reflective power of gold is a wonderful harmonizer. Now, the deeper the frame, the more broken it is by ornament, which increases the number of reflections, and, if in good taste, certainly adds to its decorative effect. In such a frame, therefore, the coast-scene of Hoguet would show to advantage when executed in oil. If, together with the oil, the water-color were copied directly from *nature*, it would *not* be exactly like the oil, were it a good water-color. To say that a water-color resembles an oil is to pay it a sorry compliment. If, together with the oil, the water-color were copied from *the same picture*, they might be almost exactly alike, and in that case might be placed in the same deep frame, with this prejudice to the water-color: that the final varnish of the oil would always make the latter appear the stronger of the two, even should the former be varnished with gum-arabic or other medium—a most dubious process. Moreover, the deep, broken frame would be in better keeping with the comparatively rugged surface of the oil, unobtainable in the aquarelle, save by the use of body-color, the last resource of the artist.

Finally, why not a water-color in a deep, white, or lightly-tinted frame? First, because they would be ugly. Secondly, because the shadows and reflections necessarily cast would cancel the chief merits of either. The white, no more a white, would be a gray; the tint would cease to be a complementary.

I am well aware that I have laid down but a few general principles which often conflict with each other. In the choice of a frame, we must, of course, consult that quality of a picture to which we wish to give prominence—the object of the picture and its destination. It is an impossible feat to condense the laws of the contrasts of color into the columns of a journal.

F. Crowninshield.

Rome, Italy, February 26, 1875.

[Our article took up the subject where our correspondent leaves it—at "the object of a picture and its destination." After expressing submission, if needs must be, to the uniformity in framing demanded by the exhibitions, we proceeded to comment on the uninventive way of surrounding a picture seen in most people's parlors. Our correspondent, whose remarks strike us as having the interest of a man's talk about his own profession, seems to us to show the artistic limitation in more than one respect. 1. His vision of a picture is not carried beyond the studio; and his mind stops at the state of trimming and relief that may suit it there. 2. He seems to view exhibitions in an awe-struck way, not only as fatal powers that either "veto margins" (and of right ought to veto them) or else dictate margins, and uniform ones, but as authorities having a forward-reaching influence, taking away from these decorations the

principle of improvement. There is nothing to show that his mind has confronted the possibility of such change. 3. His contemplation of water-color art is a contracted one, apparently considering but one school, and that the feeblest in technic; for him an oil-picture, with its varnish, "always appears stronger than a water-color," and is a work of "ruggeder surface." But as an artist, he can hardly help knowing that in a large oil-painting the saliency of its roughness is infinitely less in proportion to area than in a cartoon; that whole classes of oil-paintings are literally smooth, and that they are not framed in deep relief on that account at all; and that his talk is therefore misleading in the extreme.

To harmonize the matter, the public might profitably learn to look at the pictures of the exhibitions as the books "in stitched editions" of a European book-store are looked at. Their uniformity may furnish the shop well, but they are to be taken home and bound according to the style of the library. We cannot see the question of framing properly until the picture has been pursued away from the studio-light in which it has satisfied the artist, to a certain destination among certain surroundings. Aquarelles, seldom being gallery-pictures, are the natural illustration for this question of art-millinery. Once hung, the necessity for good taste is manifest; the passe-partout selected from "the limited range of colored pasteboard," while it may have enhanced the colors in the studio, may go to stultify them or itself when contrasted with a given panel; again, the depth, boldness, and pattern of frames should be entirely different, according as the pictures are in a heavily moulded Gothic library or in a white-and-gold Louis XVI. saloon. Our correspondent possibly has not observed the fine effects which have been struck out by some of the surest heads in the profession, through simply studying the choice of frames, by adopting what he, echoing an expression of our own, calls complementary frames. A late picture by Fortuny in oil (in Mr. Gibson's collection) was put by the artist in a broad, black, perfectly flat frame. Many a coast-scene of high tone, though in oil, looks best framed in bas-relief, as the most eminent artists have discovered. But the converse, that aquarelles may look better in deep frames, is also admitted by men whose authority makes contradiction difficult. If Fortuny was the unimpeachable master of technic in water-color, we suppose Villegas may be admitted to be prominent among those who divide his empire; and he with his compeers, as well as a slightly inferior class of vigorous artists, of whom Vibert is a specimen, show their works frequently in the deep gold recesses of alto-relief frames, without spandrels, where they succeed in holding their own, though deprived of a "varnish of gum-arabic." But it is arbitrariness, not the frequent use of paper mats, that we object to. Detaille's broad sketches in gouache are found to bear a deep frame as well as oil-pictures by Meissonier; the pretty cartoon, with a frieze-arrangement of figures along a cottage wall, by E. K. Johnson, was lately seen in an exhibition, looking very well in a mere cleat; not that this picture, interesting rather intellectually than as an example of method, would not have looked all the better in a frame properly studied for its wants. We repeat, however, that the enemy our strictures have excited is arbitrary dictation—by no means the paper spandrel or mat in its place. This matter of uniformity attains now the fixed-habit stage, to a degree that will make it, like all devices of the fixed-habit class, inevitably go down; and philosophers of the future will presently be arguing its barbarism and the inherent permanence of their own contemporary inventions. As a good lesson for American readers, we may point out the great "Niagara" by Church; it happens to have been chromo-lithographed, in a style by no means vulgar; and it is curious to see the constancy with which the broad, white margin attends it in parlors of a certain class, while the original naturally is framed without a margin. And, for a last word, we may yield the floor to Charles Blanc, that especially prudent and conservative critic, whose protest against the fashionable mode of framing will be found in another column. Though directed especially to the case of etchings and prints, it applies also to aquarelles so far as they come under the question of values.—Ed. Nation.]

# Notes.

THE allied firms of Scribner, Armstrong & Co., Scribner, Welford & Armstrong, and Scribner & Co., obeying the up-town tendency of the book-trade, have removed to quarters specially adapted to their needs at Nos. 743 and 745 Broadway, fronting Astor Place, where they find themselves in line with Hurd & Houghton, John Wiley & Son, Macmillan & Co., D. G. Francis, etc., etc. The new store is remarkable for its size and handsome appointments—a peculiar feature being a gallery, by means of which, as in a library, books are made accessible from floor to ceiling to those who wish to examine them.——D. Appleton & Co. announce 'Memoirs of Gen. W. T. Sherman,' in two volumes; and the following scientific works: 'Nature and Life,' by Ferdinand Papillon; 'Outline of the Evolution Philosophy,' from the French of Dr. E. Cazelle, by Rev. O. B. Frothingham; and 'Biology for Boys and Girls,' by Mrs. Sarah H. Stevenson.——Harper & Bros. have in press a work on Mexico by Bishop Haven—'Our Next-Door Neighbor'; 'Nooks and Corners of the New England Coast,' by Samuel Adams Drake; 'Mohammed and Mohammedanism,' by R. Bosworth Smith.——Henry Holt & Co. will publish 'Autobiography and Musical Grotesques,' by H. Berlioz; 'Art Life and Theories,' by Richard Wagner; Taine's 'Notes on Paris'; and Campbell's Austin's 'Jurisprudence.'——G. P. Putnam's Sons are to publish a series on the descriptive anatomy of typical animals, beginning with the 'Anatomy of the Domestic Cat,' by Henry S. Williams. The same firm have taken charge of the publications of the books and sermons of the Rev. O. B. Frothingham.——A 'History of Palestine and the Holy Land,' by John Tillotson; and 'Natural History of South and Southeast Africa,' from the journals of the Hon. W. H. Drummond, are illustrated works announced by R. H. Worthington & Co.——A book of poems by Paul H. Hayne, 'The Mountain of the Lovers,' will be published by E. J. Hale & Son.——F. B. Patterson announces 'Steamship Notes,' by "Norval."——J. R. Osgood & Co.'s list of forthcoming works includes the second volume of Lewes's 'Problems of Life and Mind'; Greg's 'Rocks Ahead'; 'Sex in Industry,' by Dr. Azel Ames, jr.; 'Birds in Season,' by Wilson Flagg; 'Whip and Spur,' by Col. George E. Waring, jr.; 'Illustrated Homes,' by E. C. Gardner; and two tolerably expensive works illustrated by heliotypes—'Narrative of Le Moyne,' a French artist, who accompanied Laudonnière's expedition to Florida in 1564; and J. K. Colling's 'Examples of English Mediæval Foliage and Colored Decoration.'——Robert Clarke & Co., Cincinnati, announce 'Journey in Honduras, and Jottings by the Way,' by R. G. Huston, C.E.——'Norse Mythology, or the Religion of Our Forefathers,' by Professor R. B. Anderson, of the University of Wisconsin, will be published by S. C. Griggs & Co., Chicago.——The old controversy between Lexington and Concord, as to the part taken by each in the battle of April 19, 1775, both in shedding British blood and in having blood shed, has led to the reprint of Lexington's account of the affair, intended to silence all detractors, which was prepared by Elias Phinney, and published at the expense of the town in 1825. The pamphlet is obtainable of Noyes, Holmes & Co., Boston. There will be rival celebrations of the centenary next week.——The 'Harvard Triennial' this year is to be the last of the series. The catalogue will hereafter be issued once in five years. We learn from the Boston papers that Professor Lane, of Harvard, spoke before the Massachusetts Association of Classical and High School Teachers, on the rise, history, and prospects of the new Latin pronunciation, in Boston on Friday last. A count being afterwards taken, to see what proportion of the teachers present had adopted the reformed pronunciation, it was found that more than one-third used the new pronunciation, while the rest adhered to the old. This looks like a decided gain in favor of the new pronunciation.

—The *Portfolio* (whose American publisher is Mr. Bouton) contains among the criticisms in its April number a singular suggestion as to the Platonism of Michael Angelo. In the "Creation of Adam," where the Deity evokes the form of man out of the clay of the hill-side, a group of genii is represented as supporting the divine personage. Among these attendants one is shown rising in a singular manner from under the left arm of God, in such a position as separates the figure at once from the accompanying cherubim. An examination of Braun's large photograph shows that this figure is feminine in character; and the writer, Mr. Scott, is convinced that it is a representation of Eve, existing unborn in the personality of God. An inspection of the fresco itself left the same impression, which was confirmed by the facial expression and developed bosom seen in a contemporary woodcut preserved in the British Museum. The Eve, if

Eve it be, looks intently toward Adam as he rises at the contact of the creative finger. This prophetical existence of Eve, says Mr. Scott, "is expressed incidentally by the genius of Michael Angelo, veiled a little perhaps for fear of heresy or imputed paganism, and it has remained unremarked till now, as far as we know." The rest of the number is comparatively unimportant, and is illustrated with less originality than usual.

—We are glad to announce that Mr. John T. Wood, the discoverer of the Temple of Diana at Ephesus, will give two lectures in this city next week concerning his explorations. The place and dates will be duly advertised in the daily papers, and we hazard nothing in saying that the public will be certain to find entertainment in listening to Mr. Wood. In Boston he gave four lectures to crowded houses, and was obliged to give a fifth as a summary supplement, to gratify those who could not obtain admission to the preceding. Here as there he will illustrate his lectures by means of diagrams and the stereopticon.

—The following extract is from the *Academy* (London) of January 9. We reproduce it by way of answer to Mr. Crowninshield's letter printed above :

"M. Charles Blanc, the art critic of the *Temps*, the commentator on Rembrandt's etchings, and author of numberless contributions to art criticisms, makes, in the course of a recent article on French engravings, some remarks on how to frame the prints with which most people's walls are more or less adorned. M. Blanc cannot say too much against the modern fashion of exposing to view an immense margin of white cardboard all round the picture. He reminds us that old-fashioned amateurs used to frame their Nanteuils, their Callots, their Rembrandts quite closely, like a painting. He does not quite recommend this, however. But it is very well to mention, what every observant person knows and sometimes forgets, that the white light of a broad, white margin kills the high lights of the print itself. This is so in England ; still more, of course, in France, for what is gray here looks brilliant there, and whoever would frame prints to look well in a French room must mount them with mounts very low in tone. In England the faintest rough gray paper or faintest rough buff paper, such as Whatman's, is the best. A fairly broad mount is then not only allowable but advisable, though the modern fashion errs on the side of excess. As to frames, the golden rule is surely to choose the frame which will least of all attract the eye. Black wooden frames are of course at once sober and decorative in their general effect, but if placed close to the picture they are perhaps too apt to catch the eye. The thin frame of plain oak, unpolished, is of all the least obtrusive. No one who has noticed how by an inappropriate frame you may make a good print look almost a bad one, and, by an appropriate, a tolerable print look almost a very good one, will begrudge a few minutes given to this subject of framing."

—The last report of St. John's Guild, a charitable association in this city, which is displaying great activity and administering a considerable amount of money, contains the following, as the experience of some of the visitors :

"Half-grown children of those who had until recently moved in the highest circles of society were discovered sitting at their studies in a fireless room, with nothing to hide their nakedness save old fragments of coffee-sacks, which were tied around their loins with twine. Ladies, old and young, who had been bred in affluence, were found with merely a coarse piece of cotton cloth wrapped about them to conceal their nudity. None but eye-witnesses can fully realize these fearful extremities of destitution." That the children of persons who had *recently* "moved in the highest circles of society" should be found sitting in fireless rooms, with nothing to hide their nakedness but pieces of old coffee-sacks tied around their loins with twine, is startling enough, but that they should be found "pursuing their studies" under these circumstances is something which almost passes belief. It indicates, in fact, if true, an ardor for knowledge of the like of which we have never read. That they should sell their entire clothing, and fall back on old coffee-sacks and twine sooner than part with their books, is by itself a most extraordinary fact. It is indeed so extraordinary as to suggest enquiries as to the accuracy and sober-mindedness of the person who wrote the report ; and we may add that anybody conducting the operations of a society which dispenses charity on so lavish a scale as this one, ought to be, above all things, accurate and sober-minded.

—Now that Capt. Eads has obtained authority from Congress to attempt the application of jetties to the mouth of the Mississippi River, there is nothing to be done but await the result of his experiment. The controversy between himself and the Department of Engineers, U.S.A., is therefore a matter of record rather than of present interest. Nevertheless, in a recent memorandum (No. 3) the Department offers one more dispassionate contribution to the argument on its side. This was elicited by a statement of congressman Stanard, of St. Louis, that he was not aware that the U. S. Government or private corporations in this country had ever constructed jetties. The memorandum shows, on the contrary, that "the Government has for nearly fifty years past constructed jetties at the mouths of rivers emptying into the Great Lakes, and has, in fact, created some forty harbors on our lakes by jetties aided by dredging, and is now annually applying that system." The usefulness of jetties, therefore, is distinctly recognized ; but, the memorandum affirms, the proper occasion for employing them is "where the bar is formed by the action of the waves in accumulating the loose drifting material of the shore at the mouth of a river." "The case of a delta-river is different ; there the bar is formed by the earthy matter brought by the river to the sea, and dropped at its mouth, and the bar is constantly moving into the sea, the shore following it." Under such conditions a bar may grow enormously ; as, for instance, "the bar of the S. W. Pass of the Mississippi River is more than seven miles long ; that of the South Pass is two and a half miles long." The jetties must be of corresponding length, and the memorandum holds that our knowledge of the Mississippi bar warrants the belief "that, with jetties, the rate of annual extension of the bar will be largely increased, because the width of the bar will be very much diminished, while the quantity of earthy matter added to the bar annually will be the same as before." This view is sustained by the experience with jetties in improving the entrance to the Rhone ; and is not affected by the success of jetties at the Sulina mouth of the Danube, since this has a drift-bar and not a delta-bar. The whole question of canal versus jetties is fully discussed, with the aid of numerous charts, in Appendix R of the annual report of the Chief of Engineers for 1874.

—The Engineer Department also sends us Appendix FF of the annual report of its chief for 1874, being Lieut. Geo. M. Wheeler's annual report on the geographical explorations and surveys under his command west of the hundredth meridian. It is a summary account of the work performed, and is chiefly occupied with records of astronomical observations for determining latitude, and telegraphic signalling to determine difference of time, etc. The usual map accompanies it. More readable is Lieut. Wheeler's progress report for 1872, transmitted to General Humphreys in January, and printed in quarto form. A skeleton map, somewhat different from the foregoing, is given, together with some striking views of the scenery in the cañons of the Colorado. It is mentioned that the photographer of the originals from which these are copied used the dry-plate process with encouraging success, and the hope is expressed that, "by the application of skilled labor and the refinement of instruments," we may some day "be able to give a value to the horizontal and vertical measurements upon a photographic picture." In any case, the organization of a photographic establishment in connection with the War Department is recommended. There are some interesting remarks on timber-lands in the area covered by the survey (chiefly in Utah), on irrigation, and on routes. Lieut. Wheeler believes that "comparatively few points will be found where [artesian] wells can be successfully sunk." Irrigation by canals has some chance east of the Rocky Mountains, but under very different conditions from those of similar works in Italy and India. As for the wagon-roads, in the construction of which the old corps of topographical engineers used to be engaged, Lieut. Wheeler says : "It would, in my opinion, be wise economy on the part of the Government to inaugurate anew the surveys and estimates for the construction of more accessible routes between the several military establishments of the interior, governed by necessities for their supply, possibility of the movement of troops in the change of stations, or in operations against the Indians, or in placing of the military force with celerity at points where they may be called upon to sustain the civil law." The annual report of the Chief of Ordnance for 1874 is mainly taken up with trials of the Gatling gun, and with reports on the merits, after experience, of novelties in cavalry and artillery equipments, the adoption of which appears to depend on the majority vote of officers in actual service. A very valuable work, prepared under the authority of the Treasury Department, by Major Geo. H. Elliot, of the Engineers, is his 'Report of a Tour of Inspection of European Lighthouse Establishments made in 1873.' It abounds in statistics, plans, maps, and illustrations.

—From the Interior Department we have two pamphlets issued by the Bureau of Education, and a report on the Mission Indians of Southern California, by Charles A. Wetmore, Special U. S. Commissioner. The history of this once prosperous but now hopelessly degraded people, as given by Mr. Wetmore, makes sad reading. The inroads of Mexican and of American adventurers had broken up their agricultural settlements, stripped them of their land, and forced them to seek a precarious living in the employ of the rancheros. A worse condition was in store for them. The cattle interest, which contended for mastery with the farming interest, was defeated by the passage not long ago of the 'no-fence laws," and this defeat meant quitting the field. The Indians have now no title to lands of their own, and are largely given over to vagrancy and mendicancy and the cultivation of the worst vices. Mr. Wetmore's plan of reclaiming them has much to

commend it, but, strange to say, he is opposed to giving them the ballot. Dr. Alex. Shiras's official account of the history, work, and limitations of the Bureau of Education states that the library which it has amassed, at small cost, is "of almost unexampled richness in its special line," and that, "for purposes of practical investigation," it is "superior to any in existence, except, perhaps, one at Vienna." The Bureau's 'Statement of the Theory of Education in the U. S., as approved by many leading Educators,' was designed for use at the Vienna Exposition, but has suffered delay. It seems to us capable of a more perspicuous presentation. We are glad to notice the reserve with which it is mentioned that "Declamation of oratorical selections is a favorite exercise, and *is supposed* to fit the youth for public and political life."

—The vitality of the material of the mediæval romances is astonishing, and the history of the various transformations undergone by the Arthurian and Carlovingian legends could not fail to be interesting and instructive. The latter has always been the more popular cycle, and its development extends from the ninth to the nineteenth century, from Eginhard's scanty notice among the heroes fallen at Roncevaux, "et Hruodlandus Britannici limitis præfectus," to M. Henri de Bornier's 'La Fille de Roland,' lately brought out with great success at the Théâtre Français, and which has all at once made its author one of the celebrities of the day. The plot of the play is briefly this: The traitor, Ganelon, who caused the disaster of Roncevaux, is supposed to escape the punishment prepared for him, and to live under the assumed name of Count Amaury, in his castle on the Rhine, where he brings up his son Gérald, who is ignorant of his father's past life, in the practice of all knightly virtues. Roland, the hero of Roncevaux, is also supposed to leave a daughter, Bertha, who, after her father's death, is adopted by her uncle, the Emperor Charlemagne. Gérald by chance rescues Bertha from the Saxons, and falls in love with her, his father in vain commanding him to renounce his passion. Gérald determines to set out in the usual adventurous manner of the times, and merit by his exploits the hand of Charlemagne's niece. The third act opens at Aix-la-Chapelle, at the emperor's court, where a Moorish prince, who possesses Roland's famous sword Durandal, comes to challenge the French knights to single combat. He has already overcome thirty adversaries, and the old emperor himself is about to enter the lists, when Gérald arrives, and accepts the Moor's defiance. Charlemagne lends his own sword Joyeuse to Gérald, who, animated by the presence of Bertha, is victorious, and is rewarded by her hand. Count Amaury is obliged to visit the court in order to be present at the wedding, and is recognized by the emperor, who, touched by his repentance, allows him to seek an honorable death in Palestine. Unhappily, others recognize the unfortunate Ganelon, who reveals himself to his son in a touching scene. Gérald is overwhelmed, but does not curse his father. The case, after the fashion of the day, is submitted to a tribunal of honor composed of the survivors of Roncevaux and the descendants of those killed there. They all declare that Gérald has atoned for his father's crime, and there is nothing to prevent his marriage with Bertha. Gérald refuses, and Bertha allows him to depart to fight against the infidels, armed with Roland's sword Durandal, which the emperor has placed in his hands.

—The author has, it will be seen, treated the legend quite freely. Roland was not married, but only betrothed, to Oliver's sister the Lady Alda, and Ganelon, it is needless to say, was rewarded for his treason by a terrible death. Several of the characters, among them Ganelon, are feebly drawn; Charlemagne, in particular, is only a weak old man, which, however, is his usual rôle in the Italian Carlovingian epics. The success of the piece is due largely to the patriotic element, of which the following lines will give a sample. The first is from Charlemagne's prediction of the future glory of France:

"Ta gloire! oh! puisse-t-elle aux époques prochaines,
Croître en s'affermissant, comment croissent les chênes,
Offrir l'abri superbe et l'ombre de ton front,
Nation maternelle, aux peuples qui naîtront,
Afin qu'on dise un jour selon mon espérance,
Tout homme a deux pays; le sien et puis la France."

The following is from a *chanson* celebrating Durandal and Joyeuse, which Gérald recites at a banquet:

"Durandal des païens fut captive là-bas,
Elle est captive encore, et la France la pleure:
Mais le sort différent laisse l'honneur égal."

The author, M. le Vicomte de Bornier, was born in 1827, at Montpellier, and is one of the custodians of the library of the Arsenal. He was but little known before his last success, although he had previously published a volume of poems for the anniversaries of Corneille, Molière, and Racine, which were recited at the Théâtre Français, where was also represented in 1868, with moderate success, a tragedy of his entitled 'Agamemnon.' His next dramatic venture, it is said, will be another tragedy, on the subject of Mahomet.

## SIR ROBERT PEEL.*

PEEL lives in English popular recollection as the statesman who emancipated the Catholics and gave the people cheap bread. The dubious credit of having carried measures of which he was for the greater part of his career the strenuous opponent has extended his temporary fame, but has injured his permanent reputation. It has fixed attention rather on the exceptional crises than on the general tenor of his life, and thus has at once withdrawn observation from the essential features of his genius, and placed the crises of his policy in a false light. The merit of Lord Dalling's sketch is, that it presents Peel's career as a whole, and proves that it was marked, if by inconsistencies of policy, yet by a rare unity and consistency of character. Sir Robert Peel was, from the beginning to the end of his political life, the ablest man of business who ever influenced the policy of England. Every critic, hostile or friendly, was sure to notice the "business-like" turn of his genius. The bitter sarcasms aimed at him week by week by Fonblanque, of the *Examiner*, almost constantly turn on the assumption that Sir Robert applied to politics the rules of trade. One day he is the great political carrier, the rival of Pickford: "Peel is but Pickford on a grander scale. The Pickford theorem was this: given a road made and goods ready at your hand, to carry the greatest quantity in the shortest time. The Peel theory was like it: given the labor and the work of others, to do more in a shorter time than other men." On another occasion he is painted as a horse-dealer: "It is thoughtlessly said that Sir Robert Peel is a man of no principles; as well might it be said that a horse-dealer is a man of no horses. The horse-dealer, it is true, has no particular attachment to his horses. He takes them only to part with them for a profit; and so it is with Sir Robert Peel and principles. He is a man of all principles, or an all-principled man. He has had all in turn, and made his profit of changing them as opportunity has offered." Disraeli seized exactly the same point at which to aim his invectives, and dubbed the object of his slander "the great Parliamentary middleman." The direct object of the satire is in each case, of course, Peel's supposed want of principle; but the form which the satire takes arises from the censor's keen perception of the business-like side of Peel's genius.

This is the very trait which Lord Dalling brings, as a friendly critic, into deserved prominence. Peel was (on his view), both from the force of inherited family aptitudes, and even more from the effect of training, led almost from a boy to turn his mind, not only towards politics, but towards the practical works of government. "It was to power that the boy who was to be the politician was taught to aspire; and as the impressions we acquire in early life settle so deeply into our minds as to become akin to instincts, so politics became connected from childhood in the mind of the future statesman with office; and he got into the habit of looking at all questions in the point of view in which they are seen from an official position. The efficient transaction of business became, so to speak, his passion." His devotion to public affairs was unremitting and unaffected. They furnished not only his sole employment, but constituted his sole amusement. His greatness as an administrator is attested by the confidence with which he inspired a writer like Carlyle—the last person who might be expected to admire a statesman whose fame was gained in the Parliamentary arena. His business skill was further the main cause which first acquired for him the trust of the nation. The Whigs had gained what seemed unbounded popularity by the Reform Bill. Their leaders were men of far more than average talent, but inexperience in the practice of government made them utterly inefficient in the work of administration. When their management of the Exchequer produced deficits in the midst of national wealth, the public felt that the time had come to call to office a minister who could administer public affairs on sound business principles. From whatever side Peel's policy be examined, it will be found that the great successes which were really his own, were the result of talent for business. As a party leader, his great triumph was the transformation of impracticable Toryism into sensible Conservatism. Prejudice and bigotry had lost the Tories the immense fund of prestige accruing to them from the conduct of the war. They were, as a party, tending to bankruptcy. Peel took their affairs in hand, wound up the old Tory concern, and set the party going again as Conservatives, with a large share of popular credit. As a statesman, he performed the same duty for the nation which he performed as a politician for his party. He did not voluntarily take part in violent reforms, but he gradually and cau-

* 'Sir Robert Peel: An Historical Sketch by Lord Dalling and Bulwer.' London: R. Bentley & Sons.

tiously improved every part of the administration. The return to specie payments, the formation of the Irish constabulary, the rearrangement of the finances, the creation of the London police, and other great administrative reforms, are the characteristic achievements of a statesman who brought to the service of the state the zeal and capacity which are generally devoted to the acquisition of private fortune.

The peculiar bias of Peel's mind is what places him at the head of the modern school of English statesmen. The politics of his family, his early political connections, and the circumstances of the time at which he entered public life seem at first sight to place him among the followers of Castlereagh and Eldon. His strenuous and honest opposition to Parliamentary reform, and the distrust which he probably to the end entertained towards the policy of which the Catholic Emancipation Act was the expression, appear still more decidedly to fix his place among the school of statesmen who ruled England before the reform of Parliament. But in truth, Peel's talents and disposition were far better suited for a system of government under which the trading and mercantile classes possess a predominant influence, than for the aristocratic constitution which he in vain attempted to preserve. Canning, the last of the great rhetoricians, and Lord Russell, the last of the Whigs, each belonged in spirit to the time of Pitt, of Fox, and of Burke. Neither of them possessed marked capacity for business; neither of them showed any genius for administrative improvements; neither of them sympathized with either the merits or defects of the class who came into power after the passing of the Reform Bill. Peel, though he opposed reform, was really a middle-class minister. He did not rise to power through oratorical brilliancy. He did not keep himself in power by the aid of a great aristocratic connection. Unconsciously, but none the less certainly, he instituted the modern policy of England. If he did not proclaim non-intervention he practically favored it, and if he for a time upheld protection, he entered upon a course of financial reform which almost inevitably led up to the abolition of the Corn Laws. Above all, he turned his own attention and that of the nation to exactly that kind of administrative improvement which the time required, and which Tories and Whigs alike had been too prone to overlook while occupied in the exciting and aristocratic game of politics.

That Sir Robert Peel's true claim to fame is his greatness as an administrator would be more readily acknowledged if the ordinary world were able to realize how great and, still more, how rare are the gifts required for successful administration. Industry is no doubt essential, but of itself it goes a very little way. George the Third worked as hard as a clerk, and like a mere clerk he plodded industriously on till he brought his own affairs and those of the nation into hopeless confusion. The talents really needed besides industry are determination, clear-sightedness, and resource, and these gifts are as rare as any which can be given to man. Two at least of them—clear-sightedness and resource—were Peel's in their highest perfection. His view of Catholic Emancipation is an example of his capacity for looking facts in the face. His policy was no doubt mistaken, for it was as impossible as it was unjust permanently to keep the mass of Irishmen outside the Constitution; but when he maintained that to grant emancipation was to sign the death warrant of Protestant supremacy, he certainly showed far greater insight than the advocates of emancipation, who supported a just cause by the delusive argument that when Catholics had gained equal political rights, they would be content with the maintenance of a system based on the assumption that Catholics were not the equals of Protestants. His resource appears at every turn of his career. When he did away with inconvertible paper-money, when he founded Maynooth, when he reformed the London police, he exhibited exactly that marvellous power of dealing effectively with the particular matter in hand which is often wanting to great orators and even to great reformers, but is the sure mark of a skilful administrator or a first-rate man of business.

Gratitude for public services and admiration for rare talents ought not to conceal from candid judges that Peel suffered from the defects which naturally accompany his cast of mind. He was, it has been well said, rather "clear-sighted than far-sighted." His treatment of the Catholic question and opposition to the anti-Corn-Law movement cannot be explained without assuming (in the face of the clearest proof to the contrary) that he was the most profligate of politicians, or admitting that with all his talents he did not see as far ahead as many men who were in general ability immeasurably his inferiors. His attitude towards reform of Parliament is a further proof of his want of prophetic insight. Lord Dalling, who was a member when the Reform Bill was introduced, is a first-rate witness with reference to the state of public opinion at the time. "'Mr. John Smith, an ardent reformer, said that the Government measure went so far beyond his expectations that it took away his breath. . . . Mr. Hunt, the famous radical, said before the introduction of the bill, that, if it gave members to a few of the great towns and disfranchised with compensation a few close boroughs, the public would rest content. . . . The Government plan was received with profound astonishment. Lord John continued his explanations amid cheers and laughter." Peel showed blindness throughout the whole contest. He did not understand that reform was inevitable; he did not know how to deal with the sudden enthusiasm in favor of the bill, and, for once, blundered just as a capable official does blunder when placed in a position where administrative experience is useless. He showed on this occasion not only want of foresight, but also a lack of that capacity for sudden action on the spur of the moment which Lord Russell, though in all other points inferior to Peel, has more than once exhibited on critical occasions. This want of foresight, and incapacity for dealing with unforeseen emergencies, are both characteristic of the official habit of mind, and are traceable in part to Peel's undeviating adherence to the principle of always dealing with the immediate matter in hand, and never occupying his mind with problems not ready for practical solution. This principle is a perfectly sound rule for the conduct of business. It is not without its defects when employed for the guidance of statesmanship. It fosters the tendency to delay taking up difficult questions till it is almost too late to deal with them at all. It facilitates concentration of mind, but it is a hindrance to prudent foresight.

Peel's practice of concentrating all his powers on subjects which could immediately be dealt with, accounts for the fact that, though he promoted the success of several great reforms, he never originated any great movement. He was even unwilling to follow out his own ideas beyond the point at which they could be immediately put in practice. His endowment of Maynooth foreshadowed a policy which, whatever his intentions, he never followed out to its legitimate consequences. The officialism of his mind must always be recollected when the question of his honesty is debated. Peel's great achievements ought not to conceal the fact that at some crises of his career he exhibited a kind of political shiftiness which is not compatible with the highest conceivable statesmanlike morality. But a good deal of what is sometimes considered dishonesty was merely the effect of his habit of delaying the consideration of speculative questions until they became of immediate practical importance. He believed in a paper currency till he had to consider as a practical statesman whether cash payments ought not to be restored. Further, he was, it must be admitted, in the earlier part of his career anxious for office. But the anxiety was merely a form of that most legitimate kind of ambition which consists in the desire to obtain for one's self a field where great talents may be exercised for public advantage; and it is palpable that the moral character of Peel's ambition rose as he advanced in power. In his contest with Canning he was apparently influenced quite as much by personal considerations as by his view of the public interest. When he repealed the Corn Laws he obviously sacrificed every private consideration to the good of the nation. His lasting historical reputation will, it may be suspected, be something like that of Walpole. He will live as the administrator whose great sagacity guided the British nation through a perilous stage of its development. But there is, after all, a rough justice in the popular misconception which attributes to him the whole merit of two great reforms, of which he was for the greater part of his life the opponent. Catholic emancipation and the repeal of the Corn Laws are not the characteristic triumphs of Peel's statesmanship, but they are the measures which prove him not only a great minister but also a great patriot.

## SAINTE-BEUVE'S ENGLISH PORTRAITS.*

IT may be said that if it is of no particular profit to translate Sainte-Beuve into English, it at least does no harm. Those who care to read him will be sure to be able, and to prefer, to read him in his own tongue, and those who do not will let him alone, as before. To this may be answered, we think, that a performance like the present volume sins in being a spurious rather than a real service to culture; that Sainte-Beuve, of all men, was devoted to culture in its purest and most incorruptible forms; and that it is therefore paying him a poor compliment to present him in a fashion based on a compromise with sound taste. Sainte-Beuve's was not in the least an English mind, in spite of his partially English ancestry; he was a Frenchman to his finger-tips; and his intellect, his erudition, his taste, his tone, his style, were of a deeply national stamp. It cannot be said that he spoke without authority on any subject whatever; but his authority in speaking of foreign writers was diminished by half. He spoke of them rarely; he *happened*, so to say, at wide intervals to have touched upon

* 'English Portraits. By C. A. Sainte-Beuve. Edited and translated from the 'Causeries du Lundi.' With an Introductory Chapter on Sainte-Beuve's Life and Writings.' New York: Henry Holt & Co. 1875.

Franklin, Chesterfield, Gibbon, Cowper, and Pope. The articles are charming, but even in the original they are not among his best; and in the present translation (which is yet extremely good) they offer an almost painfully dim and ineffective image of the brilliant qualities familiar to those who greatly admire him. The part of culture—the part of that penetrating and initiated taste of which Sainte-Beuve was so eminent a representative—is to say: "You are not really reading the great critic in this form; you are only half reading him; you are seeing him through a glass, very darkly; you are not doing him justice." The part of the translator of these essays, on the other hand, of the compiler of the volume for which circulation and popularity are sought, is to say, naturally: "You *are* doing him justice; the glass is a glass, but it is very clear; what you lose is, after all, not the essential." And this is why to serve up half-a-dozen of Sainte-Beuve's second-best *Causeries* as an English book is to be at odds with the very spirit of Sainte-Beuve. We may be thought rather cynically fastidious; but we may affirm that if there is a touch of ill-humor in our restrictions we are not without an excuse for it. If the voluminous introductory essay prefixed to the present volume had been a strikingly felicitous performance—had offered us any new information or any especially suggestive reflections—we do not think that we should have been less disposed to hold the translator to an account. But the essay strikes us as having little value. It is both meagre and clumsy—extremely diffuse in manner and yet very chary of real characterization, of that finer, subtler characterization of which one strikes the note in the simple mention of Sainte-Beuve's name. The author alludes to a great many books and writers, and institutes a vast number of laborious, commonplace comparisons and *rapprochements*, but we honestly think that a reader whose sole knowledge of the great critic should be derived from these pages would carry away an extremely vague and formless image. And why should the translator utter a judgment so unaccountable as the following? "Though it is hardly doubtful that Sainte-Beuve's 'Causeries du Lundi' will gratify and inform future generations of Frenchmen, yet the universality and endurance of his renown might have been still better assured had he produced one work, of moderate compass, supplying a complete impression of his power." If the 'Causeries' do not supply a complete impression of his powers, these are even larger than our large estimate of them, and if through "one work of moderate compass" he would have become more easily the intellectual companion, the ever-present, suggestive, inspiring friend of those who love letters, surely the admirably consistent, available, unimportunate form of the 'Causeries' is ingenuity sadly wasted. We are grateful to the author, however, for his quotation from Taine, which, in its admirable definiteness, stands out in high relief in the midst of his own vague portraiture.

If M. Taine has succeeded in portraying Sainte-Beuve, it is not that the task was an easy one. He himself was more complex than any figure he ever drew, and he could only have been adequately painted in colors from his own palette. There are so many things to say about him that one hardly knows where to begin, and whatever we say, we feel that we have omitted something essential. The truly essential thing, we take it, is that he worked, as Taine happily says, "for lettered and delicate men." These are Sainte-Beuve's real public—the public which would find something indelicate in Sainte-Beuve Anglicized. But even this is true only if taken in a certain cautious sense. The great critic had as much of what is called human nature as of erudition, and the proof of his genius was the fashion in which he made them go hand-in-hand. He was a man of books, and yet in perception, in divination, in sympathy, in taste, he was consummately a man of the world. It is a marvel to see the way in which he effects this subtle interfusion of science and experience. He appeals to the cultured man, to the highly civilized and finished social unit, but he appeals to him in behalf of something which demands no sacrifice of points of contact with the world, but an increase and a higher sensibility in each. Most erudition beside Sainte-Beuve's seems sterile and egoistic; none was ever turned to such infinite account, so put to use, so applied, so controlled by life. These are his general characteristics, and the portrait would be only more interesting in going down into detail. Then would appear his patience, his religious exactitude, his marvellous memory, his exquisite fancy—all the accomplishments and virtues and graces of the literary passion. On the other hand, we should touch in a dozen different directions his limitations and his defects, and these perhaps would be most interesting of all. They would be limitations of temper, of morality, of generosity, and they would also now and then be limitations of taste. This it takes some courage to say; but readers who have really suffered in a tender part of their mental organism from certain baser moments, as they may call them, in the great critic, will feel as if they had paid for the right to be positive. We allude here to the vices of temper, to his two volumes on Châteaubriand, to such an episode, for instance, as the long, interpolated diatribe against poor Gustave Planche—against his personal habits, his ugliness, his poverty—in the series of papers (in the *Nouveaux Lundis*) on Horace Vernet; as well as to many a thrust and scratch, quite out of the rules of the game, in the author's innumerable foot-notes. We should fancy that among the people of the day, within range of Sainte-Beuve's reference, there must have been a certain special, well-known physical sensation associated with a glimpse of their names in these terrible notes. There was no knowing what was coming: he never spoke save by book; what documents had he got hold of now? Sainte-Beuve's faults of taste were those of omission, not of commission. Anything he admired was in some degree admirable; but there were also things to which he was constitutionally unable to do justice. He flourished side by side with Balzac, whom he detested, without ever suspecting, apparently, the colossal proportions of the great novelist's genius. It is true that what we all dislike in Balzac Sainte-Beuve disliked with an acuteness, with a power to measure the extent of its aberration, which few of us possess. He liked Pope and Cowper, as the present volume shows, more than the mind of the "period" just now finds easy. It would be most interesting to follow through his writings the vein of old French conservatism of taste—to see it wind and twist and double, making occasionally a startling deflection into dangerous places, taking a plunge into turbid waters, but never altogether, as simple *taste*, losing a certain remote family likeness to Philistinism. Sainte-Beuve, as a whole, is the least of a Philistine conceivable; but to the end of his life, in spite of passing fancies and sudden enthusiasms, in spite of his immense and constant intellectual hospitality and flexibility, what he most relished was temperance, perfect taste, measure. This fact of necessity makes him a partial and inadequate witness to English literature. All these points will be elucidated, harmonized, balanced against each other, when a really conclusive and adequate portrait is produced—a better portrait than that which M. d'Haussonville has lately been contributing to the *Revue des Deux Mondes* with so much pretended, and so little real, liberality. M. d'Haussonville's last word is that Victor Cousin once said to him, as the conclusion of a comparison they had been making together (they might have been better employed!) of Sainte-Beuve and Mérimée: "Mérimée is a *gentilhomme*, and Sainte-Beuve is not: that is why Mérimée is superior to Sainte-Beuve." This is as valueless as the majority of epigrams. Carlyle says of Mirabeau that he had swallowed all formulas; and we may say of Sainte-Beuve that he had swallowed all *gentilshommes*—M. Cousin, certainly, *quâ* gentilhomme, included. Sainte-Beuve's defects, we think, are not to be analyzed in that line, but on an even deeper and subtler one. The best essays in the present volume are those upon Franklin and Gibbon. It is also very well to see what an acute Frenchman can say on behalf of Chesterfield, who has been too long the victim of the pure Johnsonian view. The article on Mary Stuart is, in the present state of learning, rather antiquated. That on Taine's English literature is chiefly a sympathetic disquisition upon Pope. Even if Sainte-Beuve were, at the worst, twice the Philistine he escapes being, it would still be delightful to see a conservative opinion uttered with such happy tact as this:

"But apropos of Boileau, can I then accept this strange judgment of a clever man, this opinion which M. Taine assumes, and does not fear to take on his shoulders as he goes? 'There are two sorts of verses in Boileau: the most numerous, which seem by a good sophomore; the least numerous, which seem by a good senior.' The clever man who so speaks (M. Guillaume Guizot) does not feel Boileau as a poet, and I will go further and say that he does not feel any poet as a poet. I quite understand that you should not make all poetry lie in the *métier*, but I do not at all understand that when you are treating of an art you should take no account of the art itself, and should depreciate to this point the perfect workmen who excel in it. Suppress at a stroke all poetry in verse—that would be more expeditious; otherwise speak with esteem of those who have possessed its secrets. Boileau was of the small number of these; Pope equally."

## GALTON'S ENGLISH MEN OF SCIENCE.*

MR. GALTON'S ideas in regard to hereditary genius have, we think, been somewhat misunderstood. Superficial readers constantly ask, in refutation of his theory that genius is hereditary, who and what was the father of Shakspere, of Newton, of Napoleon? But Mr. Galton's thesis is not that illustrious men all have illustrious fathers, brothers, and sons, or that even a majority of their immediate relations are illustrious—although there are such exceptional cases, as for instance the two Pitts—but that eminent men have *more* eminent relatives than non-eminent men. In other

* 'English Men of Science: Their Nature and Nurture. By Francis Galton, F.R.S., author of 'Hereditary Genius,' etc.' London and New York: Macmillan & Co. 1874.

words, one hundred eminent men, selected at random, have about nine fathers, eight brothers, and thirteen sons who are also eminent (in certain families these numbers are nearly four times as great); whereas one hundred non-eminent men have but a small fraction of one eminent man among their immediate relatives. From this Mr. Galton fairly concludes that eminence (or ability) is not, as a rule, a phenomenal occurrence, but follows certain laws, and is transmitted in greater or less degree and for longer or shorter periods in certain families; that it is increased or diminished by marriages, judicious or injudicious as regards ability; and that it would be possible, by proper selection in marriage, to breed a race of men of commanding ability in any particular department, just as it is possible to breed a race of horses remarkable for speed, or of dogs remarkable for keenness of scent.

In his work on 'Hereditary Genius,' from which the above postulates were derived, Mr. Galton carried his examination into the families of eminent men of all descriptions—judges, statesmen, commanders, divines, etc. The present work is a pursuit of the same line of enquiry in a special department, viz., men of science in England at the present day. Not limiting himself now to the trait of ability in general, he proposes to determine, with reference to one hundred and eighty foremost men of science, 1st, their antecedents; 2d, their qualities, both of mind and body, and those of their parents; 3d, the origin of their taste for science; and 4th, their education. In short, he desires to discover everything relating to their "nature and nurture," or, as he well puts it, "to supply what may be termed their natural history." The one hundred and eighty men were selected from the Fellows of the Royal Society by applying certain tests of eminence. The total number of men of "the same general scientific status" as these in the United Kingdom is estimated at three hundred; but he considered his list of one hundred and eighty sufficiently large for his purposes, the value of his results depending of course not so much on the number of cases treated as on the accuracy and completeness of the data in each case. These three hundred men bear the ratio to the male population of the same ages of one hundred in a million; hence the "man of science" is a more remarkable specimen than the "eminent man" (250 in a million) treated of in 'Hereditary Genius.'

To each of these one hundred and eighty men was sent a long list of printed questions, designed to elicit the information required. The total number of returns received is not stated, but ninety-six complete ones were used. Here we must note a weak point in the whole investigation: it rests upon each man's personal estimate of himself, and this must necessarily be, in many cases, erroneous. Still, there is no fixed standard for ability, and the estimate of other men would also be more or less wrong; so that the method used is probably as accurate as any that could be devised. Moreover, it is probable that these self-analyses would be more free from error in the case of scientific men than of any other class; they are all trained and accustomed to methods of strict analysis, and there can be no motive for falsifying, were they capable of it, for no names nor clues to names are published. It is a strictly impersonal investigation, just as much so as if the subjects under treatment were birds or fishes.

The question of heredity appears incidentally in the chapter on "Qualities," and gives about the same result as to number of eminent relatives as was found in "Hereditary Genius," although the men considered are different. The number of eminent sons of men of science was previously found to be much larger than the number of eminent fathers—in other words, the breed of scientific men is improving. This would seem to be the natural result of certain facts stated in the chapter on "Antecedents," where we find that the marriages were well selected, the parents being generally in harmony as regards temperament and physical peculiarities, and their ages, at the birth of seventy-five per cent. of their children, being between twenty-five and forty years for the fathers, and twenty and thirty-five for the mothers—the most suitable age for both. The diminution in number of eminent relatives as the relationship becomes remote, is also found to be much less rapid than in other classes of eminent men. Summing up the returns given under the head of qualities, we find that in the character of a successful scientific man are generally combined energy, health, steady pursuit of purpose, business habits, independence of views, and a strong innate taste for science. The first four might have been expected, being elements of success in any occupation. The last, we might infer, would be found in this particular profession, but the taste is "decidedly innate" in only six cases out of ten; in the others, it is due to circumstances of situation, and occasionally to mere accident. As for independence of views, it is asserted almost universally in the returns; but we suspect that a few of the subjects have mistaken in themselves a simple craving to be unfashionable and odd for true independence. This independence does not extend to religious views, for we find that a strong religious bias proves no obstacle to scientific enquiry—a fact which Dr. Draper would do well to investigate. The great majority express strong religious feelings, but free from dogmatism; and only three returns profess absolute disbelief in religious creeds of all kinds. Among the minor traits of a scientific man, natural mechanical aptitude is generally found; but good memory does not seem to be essential, as only one in four possesses it, and one in fourteen is quite deficient. The education of Mr. Galton's correspondents appears to have been about equally divided, for good and for bad; one-half received an education conducive to habits of observation, and the other half one which was restrictive. This chapter is an exceedingly instructive one, and concludes with some valuable suggestions as to the course of education best adapted to develop scientific men.

Such, then, is the natural history of the men of science in England today, affording an approximate solution to the problem, "What are the conditions of success in the field of science?" The chief defects of this interesting work are an absence of the valuable numerical tables, reduced to a per centum, which abound in 'Hereditary Genius,' and the failure to give a complete summary of the returns instead of a selected portion of them at length. For instance, forty-two returns are given in regard to energy, forty cases possessing energy above the average, and two below it. No statement is made of the nature of the other returns. If a less number had been given in full, and a tabular statement given at the end showing the total number of each kind received, the conclusion would have been much more convincing. There also appears to be a lack of uniformity in treating the different subjects; the chapter on "Origin of Taste for Science" is well summarized and discussed at the end, but that on "Qualities" is merely a selected portion of the replies, grouped according to their nature, but not analyzed or discussed at all. The number of these replies constantly varies with the different traits, and we are not told what relation this number bears to the total number received; so that it is impossible to determine, for example, how many scientific men in a hundred have natural mechanical aptitude, and how many have not. It seems a pity that, with so much material on hand, the author should not have arranged and discussed it more completely, and at least have given us strict statistical tables so arranged that they could be readily compared. This is all the more unfortunate because this very same kind of work was executed with marked ability in the 'Hereditary Genius.' But in spite of these defects, and although it advances no startling theory, the book will well repay careful reading and study.

---

*Africa.* The History of Exploration and Adventure, as given in the leading authorities from Herodotus to Livingstone. By Charles H. Jones. With map and illustrations. (New York: Henry Holt & Co. 8vo., pp. 496.)—It is no dispraise of the industry displayed in this meritorious compilation to say that the sub-title implies more than the actual scope of the work. To describe in five hundred even more closely printed pages than these the whole course and results of African exploration (let alone adventure) would be possible only to a mind saturated with geographical lore, and gifted with remarkable powers of expression and condensation. Mr. Jones has not attempted this. He finds a small part of two pages room enough for all the discoveries prior to the eighteenth century; his real task—that of abridging the narratives produced in the last forty years—begins with Barth, Overweg, and Richardson. The preceding chapters are entitled "Topographical and General," "Madagascar," and "Notices of Earlier African Travellers," leading off with Bruce. Following Barth and his associates, we have the essence of the published works of Livingstone, Andersson, Magyar, Du Chaillu, Serval, Burton and Speke, Speke and Grant, Baker, and Schweinfurth; and chapters on Christian missions in Africa complete the scheme. As nearly as may be, Livingstone occupies a third of the entire work, and another third is divided among Du Chaillu, Baker, and Schweinfurth. Baker's 'Nile Tributaries of Abyssinia' is dismissed in a single paragraph, which states the result of his observations on the annual freshets of the Atbara and Blue Nile. Scientifically speaking, this is of course the gist of the book, which in the main is the journal of an African sportsman, and as such might properly have been excluded as Gordon Cumming has been. Baker's excursion into the Soudan, however, was not only preliminary to the expedition which terminated at the Albert Nyanza, but to the later one which he conducted under the auspices of the Khedive, as it begot in him those dreams of irrigation and colonization and empire which he vainly endeavored afterwards to carry into effect. Among the South African adventurers Chapman might have furnished the compiler with some agreeable pages. Coming down to the latest dates, we have

accounts of the Ashantee war, of Sir Bartle Frere's mission to Zanzibar, and of Lieut. Cameron's discovery of an outlet to Lake Tanganyika. In the chapter on Madagascar, Ellis is relied upon, and no mention is made of the valuable additions made to our knowledge of that island by Grandidier. But we must not look to Mr. Jones for summaries of explorations by foreigners which have either not been published in book form or not translated into English. Even Rohlfs, who has been translated, does not appear, nor Mauch, nor Mohr, nor Nachtigal, nor Bastian. On the map of Africa accompanying the volume the routes of British explorers chiefly are indicated, and these not always the ones to whom most consideration is given in the text. There is something of haphazard in the illustrations also, which are not directly referred to the text, so that we see, for example, the Hamran Arabs slashing at elephants, while not a word is said, as we have just pointed out, of Baker's sporting among them.

With these explanations, Mr. Jones's work commends itself as a welcome substitute for a bulky library of African literature. It is handsomely printed and bound.

---

*Animal Mechanism:* A Treatise on Terrestrial and Aerial Locomotion. By E. J. Marey, Professor at the College of France. International Scientific Series. (New York: D. Appleton & Co. 1874. Pp. 283.)—To scientists Prof. Marey has for several years been known as a most ardent and successful investigator of animal locomotion. The public has hitherto had only glimpses of the nature and results of his researches, but the present volume gives a very complete and, in most respects, simple account of the methods employed in bringing this branch of physiological physics to a condition not far from that of an exact science; for the analysis of movement is here not merely qualitative, it is quantitative. The number, variety, and complexity of registering apparatus employed by Marey and his pupils are simply wonderful. Most of them are figured and described so that the reader may see how far there lurks within them a chance of error. So far as we are aware, none of his conclusions have been disproved. But there are few men and few institutions possessing the means and the skill required for the construction of such apparatus as to enable them to repeat Marey's observations. The author seems to avoid controversy, and refers to others almost always with approval. This lends additional weight to the remark (page 211), that the theory of Dr. Pettigrew respecting the movement of the bird's wing needs no refutation; while in describing the wing as having its lower surface directed downward and backward in its descent, he does not even allude to the strange idea of Pettigrew that it looks downward and forward. Bipedal locomotion is illustrated by that of man, and quadrupedal by that of the horse. The author shows how the artist and the teamster may profit by these apparently abstract studies, the one for the true representation of the animal in motion, and the other for the better adjustment of the collar for the draught-horse. The book closes with a hopeful prophecy as to the imitation of aerial locomotion, and the assurance that the author and his pupils are far from regarding their studies of animal locomotion as completed.

Of the first part of the work our commendation can hardly be so unqualified as of the last. The sketch of evolution offers little that is new, and the discussion of the correlation and conservation of forces is not full enough to be satisfactory as such, while it occupies space that might well have been given to further details of the author's original work. There are a few anatomical inaccuracies, but the reader must not hold the author responsible for the extraordinary rendering of *péronéal* upon pages 75 and 88, or for the not infrequent obscurity of the translation. Since the volumes of this series are largely read by students and others who wish to refer to the authors cited, we suggest to the publishers the plan for reference now employed by Haeckel and others: a list of works is given at the close of the volume, and these are referred to by number with the number of the page. This latter may be in italics.

---

*Health:* A Handbook for Households and Schools. By Edw. Smith, M.D., F.R.S. (New York: D. Appleton & Co. 1875. 12mo, pp. 198.)—In this volume the author has brought into a form adapted to the use of schools a large amount of valuable information on the subject of health. The object of the work being not discussion, but instruction in a concise manner, many categorical statements are made which can only be accepted with considerable reserve, *e. g.*, the account in the beginning of the first chapter, based on the theory of Liebig, of the action of different sorts of food. Looked at from a scientific point of view, the book is open to a good deal of the same sort of criticism which the author's work on Foods received. There is much of the same carelessness of statement, and ignorance of the results of recent investigations, which were noticeable in the earlier work. Thus, the description of the eye, with its anomalies of refraction, might as well have been written before Donders and Helmholtz had given to the world the results of their studies in physiological optics. Beaumont's tables, derived from observations on Alexis St. Martin, are given as if nothing farther were needed to determine the relative digestibility of various articles of food. By the statements made as to the nutritive value of fish, the impression is left on the mind of the reader that the salmon alone amongst fishes has red blood. The alcohol question is treated briefly, and from a total-abstinence point of view. This is, perhaps, judicious in a work intended for a text-book, but a child who sees wine in daily use upon his father's table can scarcely be expected to "be a missionary to endeavor to reclaim others from the practice of this folly."

In spite of faults like the above the book may, in the hands of a teacher who does not derive his whole knowledge of the subject from the book itself, be safely employed to impart to school-children a knowledge of the principles of hygiene, which cannot fail to be useful to them in after-life.

## FIFTIETH ANNUAL EXHIBITION OF THE ACADEMY OF DESIGN.

I.

IN its half century of public displays the Academy has not often shown a better collection, so far as average excellence goes, than the present. The works, it is true, are nearly all cabinet or other easel-pictures of limited size and modest standard, but they are conscientious, and reveal the ardor of study and an improved refinement of technic. It should be remembered by those disposed to complain of the lack of lofty art at our exhibitions, that the conditions of painting with us are hostile to whatever is grandiose in design and conception. Our patronage is distinctly unpatriotic; the richest buyers believe that they prove their taste, rather than put it to shame, in preferring foreign to native art. Thus the careful, toilful canvases, devoted to history or the ideal, are wanting; they can only be fostered by a patronage that has faith in the national ability. Again, paintings are ordered in this country neither by churches nor the state, mural art is unknown, and the only commands for decoration in fresco go to humble workmen of Italian or German origin when a new theatre is to be hurried up. What is rather strange, our sculpture is far in advance of our pictorial art in this kind of success; there is even a rage for monumental statuary, and the plastic artist finds it possible to keep his body and soul together by means of his profession, at a time when the historical painter is completely without encouragement. We point to this primordial state of American painting chiefly because the present exhibition is not absolutely without experiments in the line of academic art. Mr. Henry Peters Gray has painted an ideal figure of Liberty, which, after many excursions among clubs and leagues and art-receptions, has settled with its eagle on the walls of the Academy at last. We think the figure is good enough to be treated with marked respect; it is a conscientious, studious, rich-looking work, full of the secrets of color, bathed in atmosphere, and showing trained ability in every part; at the same time, Mr. Gray's Freedom is not Freedom at all, to our thinking; the motive is voluptuous rather than epical, and there is that in the conception, as the budding girl exchanges confidential glances with her aquiline attendant, which is sure to provoke the smile of the scornful. But still it ought to be felt among us that our art will rise above the art of the illustrated-newspaper sort only by the studies, the aspirations, the conflict and the success of which this picture is no mean product.

Another thing, and a praiseworthy thing, which makes the exhibition this year rather elevated than exciting, is that scarcely any sensational foreign pictures are present. There is not even an enormous cattle-piece by Schenck in the middle of the great room. Mr. Bierstadt, it is true, appears to be resuming his vocation of painting western mountains the size of nature, but he is not exactly a foreigner; and our native topographical artist, Mr. Thomas Moran, has been merciful, and contracted his spangled Utah scenery into measurable limits. Nor do the works of landscapists, whether foreign or home-bred, attract that unreasoning concentration of attention which is brought to bear on the huge Cabanel, or Merle, or Regnault just bought and placed by its proud owner in the American art-school. The only important French picture this year has been contributed by a well-known patron of the Academy, who hangs up Bouguereau's smooth-looking portrait of a child belonging to his family. It is delightful to be able to say

that this learned *académie* of Bouguereau's is surrounded by American pictures which do not lose, but rather gain, in obvious strength by the comparison. The Elizabethan head by Mr. Neal, with its laced ruff striking positive silver sparks against the black ground-work, and its sumptuously-modelled features, is a rude effort in the Piloty style, that would look strong even in an exhibition of Rubenses. The vigorous three-quarter face, by Mr. Brush, set against a light background and positive as a bronze, is a happy prophecy of the future of American portraiture. The figure of a large, fresh, frank-looking girl, by Mrs. Loop, is as sculptural, as intelligent, as thorough as any portrait we have lately seen. The likeness of Mrs. Greatorex, by Mr. Toby Rosenthal, has something rounded, rich-looking, and shadowy about it that gives it the charm of an ideal work. Mr. Chase, of St. Louis, sends "The Dowager," a really superb Rembrandtesque study, completely harmonious in the character of painting it represents, and so instructive and serviceable as a model that it was bought on varnishing-day by a prominent artist. Among these powerful portraits—and portrait, it is well to remind the reader, is the only form in which an American painter is now allowed to do life-sized work—we would point to an exceptional specimen, whose justification is rather delicacy than robustness; we refer to the lady's bust-picture by Mr. Eastman Johnson, a piquant model absolutely saturated with expression, and brushed with a very thin mantle of color that in this instance seems absolutely right.

The ideal world of the American school has about the smallest showing in the exhibition that any *genre* could possibly have and exist at all; but Mr. La Farge happily contributes his epithalamium-picture of Eros leading Psyche. It is fortunately hung between one of Mr. Homer's real and daylight effects and a robust kitchen subject; and in this kind of neighborhood it seems to be hushed up in the veiled light of dreams. The tenderness of the attitudes, the poetic slightness of the work, the curtained stillness of the group, and the softness with which the feet of the figures rest upon the earth, are all treated in a very sonnet-like and polished kind of condensation. But the painting, like most of Mr. La Farge's painting, is obviously tentative; it is a record left by one of the tribe of seekers. This artist has been now so many years indulging us with a sight of his beautiful experiments that we wonder when he will give us something clear and specific, showing delicacy of execution instead of delicacy of aim. Another of Mr. La Farge's subtlest subjects is drawn on wood, and shows an enchantress touching her lover with a wand, at which the victim changes to a rolling snake, with a long glance of despair from the eyes about to sink into metamorphosis. His exquisite title-page for the book called 'Lotos-Leaves' and the lily-born nymph from the 'Old Dramatists' are exhibited also, in proofs of the unapproachable engravings of Mr. Marsh.

We hasten, before closing this curt preliminary notice, to signalize the development of a very different talent—the manly, open-air, sincere art of Mr. Homer. Since his war-pictures he has not done himself so much justice. He always brings us something quaint, uncopied, and freshly-viewed; and this year he puts forward several novelties of effect that strike the eye like revelations. Another artist, for instance, would hardly think of making a motive out of the horizontal stripes of a fence, relieved against a ground of very slightly differing value, so as to make the group at the fence appear like a decoration wrought upon a barred ribbon; yet that is the problem very effectively wrought out in his milking-picture. Where he is Mr. La Farge's neighbor, Mr. Homer seems to have tasked himself to supply the most stimulating contrast imaginable. The Psyche of the former is set side by side with one of Homer's blowsiest New England girls, who chews a straw as an expression of contrariness, while she leans against a bank of stubble, thereby teasing a practical-looking lover, who is not going to put up with her airs much longer. The finish is for once carried to an expressive and satisfactory point, and nothing can be more plainly set down than Mr. Homer's idyl of ill-temper, wherein we can see the acme of endurance accurately reached, and almost hear the rough Hosea-Bigelow patois as these immobile domestic Memnons clasp their knees in the sunshine. Another of the artist's pictures is less praiseworthy—indeed, shows Mr. Homer with all his originality and all his vices: it seems to be the memorandum of some effect wherein the artistic eye was caught with the sunny flash of pigeons and other white creature studded about a farm-shed; but the silvery patches have attained a distressing regularity, and the picture, dismissed at the point of the very rudest sketching, seems to have been hung with some satirical intention precisely where it is most compromising and conspicuous.

JUST PUBLISHED.

## *Sainte-Beuve.*

English Portraits. By C. A. Sainte-Beuve, of the French Academy. With an Introductory Chapter on his Life and Writings. 12mo, cloth, $2.

"Will probably excite more attention among the reading public here than any of M. Taine's books have done."—*London Correspondent Boston Advertiser.*

"Of course, Sainte-Beuve could not put his hand to any task, congenial or not, without producing something highly polished, artistic, delicate, or subtile. . . . His criticisms, more than anybody else's, are difficult to shut out."—*Boston Transcript.*

"The introductory chapter on Sainte-Beuve's life and writings supplies, with an excellent biographical study, one of the best prefatory chapters of the kind that we remember."—*Appletons' Journal.*

## *Mrs. Alexander.*

Ralph Wilson's Wierd. A Novel. By Mrs. Alexander, author of 'The Wooing O't' and 'Which Shall It Be?' 16mo, Leisure Hour Series, $1 25.

*HARPER'S CATALOGUE.* The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

## *Fysshe and Fysshynge.*

From the 'Boke of St. Albans,' A.D. 1496.

By DAME JULIANA BERNERS.

A copy of the English Edition of 1827 costs $82 to import.
Price of the American Edition, 1875, heavy tinted paper, 12mo, cloth, $1 50.
The charming old work, reproduced in all its quaintness. Edited by a member of the New York bar.

Sent on receipt of price by

HENRY K. VAN SICLEN, Bibliopole,
No. 133 Nassau Street, New York.

## *The American Educational Cyclopædia.*

A Reference Book for all matters of Education in the United States and in the World

It is valuable for Teachers, School Officers, Clergymen, Lawyers, Editors, Politicians, and Parents with children to educate. It is endorsed by the highest authorities in the land, among which are forty-seven out of the forty-eight State and Territorial Superintendents. It contains 300 pp. bound in cloth, $2; in manila covers, $1 50.

J. W. SCHERMERHORN & CO., Publishers,
14 Bond Street, New York.

*A SHORT HISTORY OF Greece, Sermons of an American-English Vicar, and the Story of a Scotch Marriage, engage Macmillan's "Reader" on next page.*

# *The Reader.*

GREECE "IN NUCE," A MODEL SHORT HISTORY—SERMONS OF A SCHOLAR AND A WORKER—GOOD RECENT FICTION.

Lucid and compact, the little 'History of Greece,' by C. A. Fyffe, M.A., is one of the masterpieces of the "Primer Series," edited with so much compressive skill by Mr. J. R. Green. Himself a historian of very rare powers of condensation, he seems to have communicated this faculty to his collaborator in the present instance. In the course of a small tract of 127 pages, Mr. Fyffe reviews the story of Greece from Theseus to the fall of Corinth, giving unity to the relations of its mosaic of states; explaining the religious origin of all the schemes for concerted action known to the Greeks; the abolition of regal rule, attributed to Theseus; the codification of existing laws by Draco; the triumph of wealth over caste in the time of Solon; the gradual rise of the Thersites of the period from his inconsiderable position to a more regarded one; and so on to the check given at Marathon to Asiatic conquest and the gradual refinement of power by means of amenity as seen in Perikles, Nikias, and Alkibiades. With this class of cultured leaders the author contrasts the Macedonian barbarism of Alexander: "If he is to be treated as a Greek, some of his acts can only be compared to those of the very worst tyrants." The gradual emancipation of society and representation of the people, limited and unsatisfactory in degree as it is in Greek history, engages Mr. Fyffe's attention whenever possible; the suppressed classes are the continual objects of his interest and curiosity. "In reading the history of Greece," he remarks, "we must bear in mind that we are reading the history of the masters only, not of the slaves; there was another part—the slave population—whose history, if it existed, would perhaps be too full of misery and suffering for us to bear to read it." In another part of the Primer we have Socrates fulfilling his mission of unbelief, dying for it, and introducing the idea of ethical skepticism carried to the point of martyrdom. "He taught that the gods wished men to honor them, not by beliefs," but by goodness, and thus gave birth to the Emersonian opinion that the gods "are the doubter and the doubt." The whole treatise is redolent of originality and acumen, while it is written in language that is plain to any child. It will be a just grievance on the part of readers of mature age if they are crowded out from access to this book by the young people, for whom it is principally intended.

The sermons of the late Rev. George Collyer Harris, the American-born vicar of a church in Torquay, are published by Macmillan & Co., with one of Miss Charlotte M. Yonge's agreeable memoirs for an introduction. Mr. Harris was the type of the well-read, intelligent, energetic pastor who dedicates his life in service amongst his flock. His sermons are sterling, and readable, and vital. In an "occasional" address delivered after a storm, he demands charity for the shipwrecked boatmen with an eloquence rarely heard, tempered with this exquisite piece of urbanity: "I plead for the poor young widow, . . . for the brave men too, . . . and I plead lastly—oh! pardon me, dear brethren, for my importunity—I plead for your own souls." Surely Whitefield, unbuttoning the pockets of Franklin, was not more successful than must have been this master of persuasion and grace.

After several recent Scotch novels of coast-life which have been exciting literary attention, the delicate little sketch of 'Elsie,' by "A. C. M.," has a different, a stiller, and a tenderer bouquet. It is a simple story of a pseudo Scotch marriage—the equivalent of a seduction—and the sweet behavior of the victim in her deserted after-life. It has no more plot than Lamb's tale of 'Rosamund Gray,' but it breathes the violet-incense of purity, and attracts by its graciousness and repose of style.

## *A NEW SERIES OF HISTORY*

and Literature Primers. Edited by J. R. Green, M.A., Examiner in the School of Modern History at Oxford, author of 'A Short History of the English People.'

*HISTORY OF GREECE.* By C. A. Fyffe, M.A., Fellow and late Tutor of University College, Oxford. With Maps. 18mo, cloth, 40 cents; paper covers, 30 cents. [*On Saturday.*

*ENGLISH GRAMMAR.* By the Rev. R. Morris, M.A., LL.D., President of the Philological Society of London, author of 'Historical Outlines of English Accidence,' 'Elementary Lessons in Historical English Grammar,' 18mo, cloth, 40 cents; paper covers, 30 cents.

"Both the historical and grammatical relations of the language are exhibited in a manner which leaves nothing to be desired in a book of practical reference. The younger pupil will find here everything essential to his progress ready prepared at his hand, while it will serve the more advanced student as a valuable refreshment and aid to his memory."—*N. Y. Tribune.*

*** Other volumes will follow.

*MACREADY'S REMINISCENCES* and Selections from his Diaries and Letters. Edited by Sir Frederick Pollock, Bart., one of his executors. With Four Portraits Engraved by Jeens. 12mo, $2 50.

"The whole forms one of the most interesting and, in many respects, valuable records of artistic and social life, as well as of the personal inward man. There is nothing omitted that a reader has a right to look for in such a record, as regards the history of the stage and the home life of the actor. With respect to the inward man Macready is even sterner with himself and his faults than he ever was with his fellow-actors and their offences. The book will raise him in the estimation of every reader."—*Athenæum.*

"This interesting work. . . . The eminent tragedian's early life is vividly told, and his associations with the stage narrated. Of many of his friends, also, Mr. Macready relates piquant anecdotes which are worth preserving."—*London Daily Telegraph.*

*WILLIAM, EARL OF SHELburne*, afterwards First Marquess of Lansdowne, The Life of. With Extracts from his papers and correspondence. By Lord Edmond Fitzmaurice. Vol. I., 1737–1766. 8vo, $4.

"This is a volume of extraordinary interest and value. 'One of the suppressed characters of English history' is restored to us, and we marvel only that Lord Shelburne's autobiography should have waited to be edited by his great-grandson instead of having been published early in the present century by his son, unless, as we hear, its existence was really unknown till last year. Good as it is, to our great wonder it is better as a book of gossip than as a book of history. The characters of leading statesmen are gems, and epigrams which will dwell in the memory abound."—*Athenæum.*

*A SHORT HISTORY OF THE ENGlish People.* By J. R. Green, M.A., Examiner in the School of Modern History at Oxford. Crown 8vo, with Colored Maps, Genealogical Tables, and Chronological Annals. $2.

"We know of no record of the whole drama of English history to be compared with it. We know of none that is so distinctly a work of genius."—*Pall Mall Gazette.*

"It stands alone as the one general history of the country, for the sake of which all others, if young and old are wise, will be speedily and surely set aside."—*Academy.*

*THE STATESMAN'S YEAR-BOOK* for 1875. A Statistical and Historical Annual of the States of the Civilized World. Hand-book for Politicians and Merchants. By F. Martin. (Twelfth Annual Publication.) Revised after Official Returns. Crown 8vo, $3 50.

"Bears the marks of conscientious revision since its last issue, and with its chronicle of events, its comparative tables (considerably renewed), and its political and statistical account of the civilized states of the world, continues to be a most useful manual for study and reference."—*The Nation.*

"An exceedingly handy work for reference, which may be commended without qualification."—*Financier.*

*LEOPOLD VON RANKE'S HIStory of England*, principally in the Seventeenth Century. Translated from the German. 6 vols. 8vo, $24.

"The title but imperfectly represents the scope of the work, which really embraces the entire period of English history, beginning with the conquest by Cæsar, and ending at the accession of George the Third. The portion relating to the seventeenth century is treated in greater detail than the others. The historian examines it in the light of documents and information which he either discovered, consulted, or obtained for the first time. All the other sections are dealt with in a fresh and independent fashion, and are the more useful on account of the way in which the art of condensation has been applied to them. . . . He takes nothing for granted; he investigates every mooted point; and he is unwearied in consulting and comparing his authorities."—*London Daily News.*

*THE METHODS OF ETHICS.* By Henry Sidgwick, M.A., late Fellow of Trinity College, Cambridge. 8vo, $4.

"We have in the attempt to supplement this critical examination of ethical thought by a meagre outline of what we hold to be its true basis, been unable adequately to express our admiration for the work reviewed itself. If we spoke our whole mind we should accuse Mr. Sidgwick of sympathy with that disintegrating tendency of modern thought which seems to us the guidepost away from the true theory of morals, but the candor, largeness, and accuracy of his intellectual vision make his review a fitting prelude to any conclusion, for almost all the facts on which a moral hypothesis must be based are touched on in it."—*Spectator* (*London*).

*SELECTIONS FROM BERKELEY.* With Introduction and Notes. For the Use of Students in the Universities. By A. C. Fraser, LL.D., Professor of Logic and Metaphysics in the University of Edinburgh. Crown 8vo, $3.

"For an admirable selection from Berkeley's writings, including 'The Principles of Human Knowledge' and the 'Essay Toward a New Theory of Vision,' we are indebted to the accomplished editor of his complete works. Dr. Fraser has enhanced the value of this selection by the addition of explanatory and critical notes, with introductory and supplementary comments."—*Westminster Review.*

*THE LIFE AND LETTERS OF* Bishop Patteson. By C. M. Yonge, author of 'The Heir of Redclyffe.' With two Portraits on Steel. 2 vols. crown 8vo, $5.

"Miss Yonge's book is in one respect a model biography. It is made up almost entirely of Patteson's own letters. Aware that he had left his home for once and for all, his correspondence took the shape of a diary, and as we read on we come to know the man, and to love him almost as if we had seen him."—*Athenæum* (*London*).

"As the picture of a character, Miss Yonge's volumes have an interest of a high order. Bishop Patteson was of the stuff of the old-time saints, with a great many virtues in addition that the saints often lacked. He offered an extraordinary combination of resolution and earnestness, of the invincible will and the loving spirit. He is a brilliant figure in the noble class of men whose genius has been a matter of the life itself; whose idea and effort have been a passionate personal example. For the Episcopal Church, of which Bishop Patteson was essentially a product, such a type, such an example, is a precious possession."—*The Nation.*

*THE STORY OF A FELLOW-*Soldier. An Account of the Life and Missionary Labors of the Rt. Rev. John Coleridge Patteson, Bishop of the Melanesian Islands. By Frances Awdry. Extra fcap. 8vo, with six Illustrations, $1 50.

"This is the life of that brave, single-minded, and untiring Christian soldier, Bishop Patteson, written for the young. It is simply and pleasantly written, and presents a lively picture of the labors, hardships, troubles, and pleasures of earnest missionary work among the Polynesian Islands."—*Standard.*

"An abstract from the larger work put into simple language for children—a happy idea, for Bishop Patteson's career is one of which even infant minds may perceive the beauty and impressiveness."—*Nation.*

## NEW NOVELS.

*ELSIE:* A Lowland Sketch. By A. C. M. 12mo, paper, $1. [*Just published.*

*THE HARBOUR BAR.* A Tale of Scottish Life. 12mo, paper, $1.

"Bright, picturesque, and true to life. . . . The story is readable and pleasant from first to last, growing in interest as it proceeds, and everywhere showing that the author is really at home in all the vivid scenes which she describes."—*The Standard* (*London*).

"Upon the working out of Elsie's character the author has expended the more labor, and with good results, too, for rarely in fiction is there to be met with a more perfectly finished picture of a true-hearted, unselfish woman. . . . The description of the terrible catastrophe of the storm on the Harbour Bar is perfect in its graphic vigor and intensity."—*Morning Post* (*London*).

*FOR THE KING'S DUES.* By Agnes Macdonnell. 12mo, paper, $1.

"A book with simple scenes, unvarying in interest to the close."—*N. Y. World.*

*GOVINDA SAMANTA;* or, The History of a Bengal Raiyat. By the Rev. Lal Behari Day. 12mo, paper, $1.

"The work before us is not only excellently conceived and well-written, but it deals with topics which, if familiar to Indian administrators, are to the English reader as novel as the incidents in 'Uncle Tom's Cabin.'"—*Saturday Review.*

"Besides writing a novel of a perfectly original character, one which even the most blasé frequenter of the circulating library must acknowledge to be out of the common, he has contrived to give us an immense amount of information concerning the peasantry of India."—*London Morning Post.*

*NEW YORK, THURSDAY, APRIL 22, 1875.*

## The Week.

THE Massachusetts Centennials at Concord and Lexington, in spite of the extraordinary weather, have been celebrated very happily, and their success will no doubt give a renewed stimulus to Centennial activity in Philadelphia. The rivalry between Concord and Lexington seems only to have had the effect of making the celebrations more perfect, and of bringing out more oratory and poetry than otherwise. It would probably be difficult to find any part of the country in which poetry and speaking so good as that of Lowell, Whittier, Dana, Curtis, and Emerson could be got for such an occasion. In looking over the speeches it is striking to observe how little of the old bombastic and flowery rhetoric of the ante-war period they contain, how much more like grown men every one behaved than probably would have been the case if the centennial had taken place, let us say, about the year 1859. The speech of Governor Chamberlain, of South Carolina, at Lexington was a vigorous appeal for a return to the old cordial and fraternal feelings which existed between the two States at the time of the Revolution, quoting very happily from Burke: "Magnanimity is not seldom the truest wisdom; and a great empire and little minds go ill together."

We see from the newspapers that it was popularly supposed that General Grant would take the occasion offered by these Centennials to do one of two things, either to resign his office on the ground that he felt himself incompetent any longer to perform its duties, or else to repudiate explicitly the "third term," and announce that nothing would induce him to depart from the precedent set by Washington. The licentious sheets which put this story in circulation felt, probably, that there was a want of absolute certainty about it; but they have now discovered something which the President's party actually did do on the way to the Centennial, which more than makes up to them for the painful silence of the President as to his "third-term" aspirations and his resignation. In a suit brought by a stockholder against the New York and New Haven Railroad Company, an injunction was recently issued by the Superior Court of Connecticut restraining that road from the giving of any free passes to legislators, or any State officers, or officers of the General Government. Curiously enough, the first public officials travelling on free passes who attempted to go over the road after the injunction were President Grant and his party, en route to Lexington and Concord. Governor Gaston's Secretary, who was escorting the President, indignantly protested against the outrage of stopping so distinguished a party, and loudly talked of insults, etc., but all without avail. The gate-keeper was inflexible, and the entire party were obliged to wait until tickets could be bought and punched before they were allowed to take the train. The incident was certainly an awkward one; for the system of granting free passes has been carried to such an extent of recent years that all our most prominent public men have come to look on transportation as a perquisite attached to their offices, and the Chief Magistrate is no doubt just as much entitled to his free pass as "Bosses" or statesmen of inferior grades. But it is very remarkable, whenever any reform is set on foot which cuts into perquisites, how bad the motive of the reformer always turns out to be; and so, in this case, the public-spirited stockholder who sued out the injunction has received a scathing rebuke from the president of the road, who, in his published order to enforce the injunction, declares that he cannot imagine what the stockholder's motive can be, unless it is to get himself talked about.

On Wednesday week a Philadelphia anti-slavery society, with an old-fashioned length of title, celebrated its hundredth anniversary. Vice-President Wilson occupied the chair, and Dr. Furness, Frederick Douglass, and Mrs. Lucretia Mott were also among the notables who took part in the proceedings. The good feeling and the absence of passion which one would naturally look for on such an occasion were generally observable in the speeches; but there are abolitionists and abolitionists, and Mrs. Stephen Foster saw fit in her historical retrospect to single out President Lincoln for denunciations which would still seem obsolete even if applied to Jefferson Davis. Mr. Wilson promptly vindicated the memory of the dead against this wild attack of an "irreconcilable," but the proprieties of the celebration had been violated beyond repair. Of Dr. Elder's oration we have as yet seen no report. The Pennsylvania Society represents the earliest organization of the anti-slavery sentiment of the country, and would, but for its having had funds to administer, have died a natural death at the close of the war, as did the societies which grew out of the later anti-slavery (or more properly pro-slavery) agitation in the second quarter of the present century. It was at first designed to prevent the kidnapping and enslavement of free negroes—a practice which we may suppose to have become flagrant in 1775, and to have been suspended almost immediately thereafter by the Revolution. The kidnappers and the Quaker philanthropists had other things to think of for the next few years, and when the Society was reorganized in 1787, with Franklin at its head, the discussion of human rights in the meantime made a broadening of its scope both logical and safe. It was now the Pennsylvania Society for promoting the abolition of slavery, the relief of free negroes unlawfully held in bondage, and for improving the condition of the African race. Similar organizations sprang up in Rhode Island, Connecticut, New York, New Jersey, and even in Delaware, Maryland, and Virginia. John Jay and Alexander Hamilton were presidents of the New York Society. Benjamin Rush, Ezra Stiles, Theodore Dwight, and Samuel Hopkins were other distinguished leaders in this movement, which held conventions, sent memorials to Congress praying for the abolition of slavery, and then melted away before Whitney and his cotton-gin and the increasing rigor of the laws against manumission in the Slave States.

The past week has been notable for cold and unseasonable weather. Of course general trade has been more or less injured, and to an extent not yet ascertained the crops have been damaged. The lateness of the season has prevented the trees from blooming, so that north of Virginia the fruit-crop will be saved. Cotton may have to be replanted, but this is not an alarming matter, as last year and the year before the same thing had to be done a week later in the season. All through the West the cold weather has prevented the settling of the earth roads; accordingly, railroad freights have been light. The war between the trunk roads is going on with vigor, and rates between the Atlantic cities and St. Louis and Chicago are lower than ever, with no prospect of an advance. The export trade of the country has been exceptionally light, both because prices here had been carried in all instances so near to the foreign markets that, with the advance in ocean freights, there was little or no profit in shipments, and because in some cases prices here had been absolutely advanced above the foreign markets. For the last few days breadstuffs and provisions have been heavy. Cotton has also declined, but is yet above Liverpool; the home demand is small, and the labor troubles in Eastern mills have their influence. The stock of cotton at our own ports and at Liverpool is larger than at the corresponding time last year, New York alone having about 50,000 bales more. In Wall Street, the week has been very quiet. The banks have added about $1,750,000 to their reserve, and raised their surplus reserve to about $10,000,000. Loans, both demand and on time, are more easily obtained and at

lower rates. Investment securities have advanced. Stock speculation has been very tame, and prices changed but little until it became known that the managers of the Panama Railroad had come to an understanding with the Pacific Railroad managers, when all the stocks in interest began to rise, Panama going up twenty per cent. in a single day. Damage from freshets on the Pacific railroads interfered with the rise in their securities. Gold has been very quiet but firm, the rates for sterling bills being still quoted at figures which justify coin exports; these, apparently, are only awaiting the importers' demand for remittances. In London money is easier; the Bank of England is gaining bullion, and its minimum rate for discounts is fully one-half above that of the outside discount banks.

---

The Louisiana difficulties have at last come to an end. The "Wheeler Compromise," so-called, has been accepted by all parties, and the legislature has actually organized and gone to work. By this compromise the members who were so summarily unseated by United States troops are restored to their places, thus making the House Democratic, but leaving the Senate Republican. On the other hand, Kellogg is to remain governor until January, 1877, and is not to be impeached for past offences. The compromise was adopted by a very large majority of the members of both political parties, and appears to be even better received than is usually the case with compromises. Governor Kellogg in his message talked about forgetting the past, and advised all parties to unite in the good work of restoring the credit and prosperity of the State. As regards the future, the feeling, both in and out of the State, seems to be a hopeful one, and, apparently, all concerned intend to try to keep good-natured.

---

One incident which took place toward the close of the happy adjustment of the above difficulties seems to us to demand the serious attention of every earnest friend of the present Administration. A colored member of the House, one of those who had been made a member by force of arms, and who was therefore unseated by the adoption of the compromise, made a little speech as he was about to retire, in which he not only expressed his acquiescence in the compromise arrangement (as did, by the way, most of the retiring members), but actually went so far as to add that he derived great satisfaction in giving up his seat from the fact that it would now be occupied by his old master, who had always been just and kind to him, and he considered himself honored thereby after a fashion which did not occur every day. Certainly Mr. Poindexter of Assumption, this colored ex-member of the House, should receive a severe reprimand from the active friends of his race throughout the North. If Southern freedmen are to be allowed to talk in this way, and to have their speeches publicly reported, the anguish in which the Civil Rights Bill was begotten will have been all in vain; it will be impossible to feign the necessary excuses for calling out the military in cases of political emergency, and the war of races, now almost the sole reliance for firing the Northern heart, will come to an untimely end.

---

Another "great philanthropist," it is reported, is soon to arise in Indiana, in the form of a gentleman who intends to give one million dollars for the establishment of a college to be devoted exclusively to the education of poor students—board, clothing, and tuition to be free. If the report is correct, therefore, we shall probably soon have another weak school, with underpaid teachers and an insufficient library, struggling along in some Western town, the inhabitants of which will point proudly to their "college" and learn to talk about "students" and "professors." We have the utmost respect for the feeling which prompts the giving of so large a sum of money, but we wish, as we have often wished before in like cases, that the generous impulse might have been accompanied by some exact knowledge of what is necessary to the attainment of the end proposed. To the self-made man (so often the donor of these large sums), who began life with twelve cents in his pocket, one million of dollars seems doubtless a sum of money sufficiently large to establish almost anything. Having, as a rule, no adequate understanding of the meaning and nature of a college, he does not know how little one million dollars can do towards establishing a real college, or how much good the same amount of money might do if put to use in connection with some college already *established*. If two or three hundred weak colleges, now living at a poor dying rate, could be rolled into two or three, or even into one, the cause of genuine education would take a much longer stride forward than it now is likely to take for a very long time to come. We respectfully submit to this last "great philanthropist" and his advisory friends, if it be not too late, that if his one million dollars should be expended in devising some expedient for successfully carrying out this last suggestion, more good would be done to American youth, rich and poor, than could possibly be done by very many millions expended in the way now proposed.

---

The answers of the defendants in the Emma Mine suit are getting published, but, as far as they have appeared, throw no new light on the swindle. The story told by Park and his friends is a plain, straightforward tale, which appears to clear them entirely. They were out in Utah, when, one morning, they heard of the Emma Mine as a valuable property, saw the owners, named their price, and took the mine. Then they went across to England, and offered to sell the mine. Messrs. Coates & Hankey said they thought it was just the sort of property they would like, and agreed to take it provided it were reported on favorably by some competent authority. Mr. Park and his friends at once said, "Whom would you like to have examine the mine?" to which Messrs. Coates & Hankey at once replied: "There is no one in the world so well fitted for the task, by education, ability, and character, as Professor Silliman of New Haven." In this way Mr. Silliman was engaged, not by Mr. Park at all, but by the persons to whom the mine had been sold, and it was on Mr. Silliman's report that they took it. More than this, they expressed themselves satisfied with the purchase, and later, when doubts had arisen as to the value of the property, the stockholders sent over a committee of their own to report, and the report of this committee was favorable also. Our readers know very well what is thought of this defence in the English courts.

---

According to the *Tribune's* Washington correspondence, the Secretary of the Interior has been requested by the President to resign. Facts, it is said, have been brought to his notice "so powerful, so convincing, and so threatening" that the President has been bound to notice them. The "simple fact," according to the *Tribune's* informant, is that "corruption has at last been traced within the bosom of the Secretary's family," or, in less metaphorical language, Mr. John Delano, the son of the Secretary, is implicated in improper transactions—though what they are is not stated, except that they relate to the Indian Department. It would be an excellent thing to have a searching investigation of the Indian Department, and the President could probably not do a more popular thing than begin at once to "trace corruption," even if it leads him to "the bosom of the Secretary's family"; but in case of such enquiries we beg to call his attention to one or two matters in advance. If it should turn out that Secretary Delano has been a corrupt man, and has been the cause of corruption in others; if his son has made large profits out of fraudulent contracts with the Indians, and he has connived at it, his removal will be undoubtedly welcomed by the public at large as a new proof of the hearty desire of the President to reform the civil service; but if, after the exposure, should there be one, Delano is given a new office, and his son John immediately secured in a new Government berth, we fear very much that there will be a good many ribald jeers in the newspapers about "civil-service reform," and that all attempts made by the President's friends to explain his conduct by reporting that privately he was very much opposed to re-

appointing them, but that the pressure brought by the politicians was really too much for him, will be received with incredulity.

---

The trial of the Guikwar of Baroda for an attempt to poison the Resident at his court, Col. Phayre, has ended in a disagreement of the commission. The case was conducted for the defendant by Serjeant Ballantine, brought out from England at a fabulous expense, and altogether was remarkable in more ways than one. The commission which tried it consisted half of English and half of Indian officials, and the examination of the witnesses brought before the judges all the curious details of life at an Eastern court. One of the witnesses was the supposed preparer of the poison, who maintained a perfectly self-satisfied air throughout the proceedings; and there was also his accomplice, who seems to have been generally disbelieved, and yet was so strongly moved by remorse or some other feeling that he attempted to take his life by throwing himself into a well. One of the difficulties of the case for the prosecution was that the Guikwar did not seem to have a sufficient motive for desiring to take the life of the Resident. He was displeased, indeed, with Col. Phayre, but he had applied to the Indian Viceroy, Lord Northbrook, to recall him, and, at the time of the poisoning, had every reason to believe his request would be granted, as shortly afterwards it was. The English press express much regret at the result of the trial, which certainly places the Viceroy in an extremely awkward position. To try a native prince on a charge of poisoning, and to have the trial end in a disagreement procured by the astuteness of an English barrister, will, it is feared, not have a good effect upon the native mind. Instead of being regarded by them as a proof of the impartiality of the administration of Anglo-Saxon justice, the natives may look upon it merely as a proof of weakness and vacillation.

---

The latest incident in French politics has been the appearance of a circular issued by the Minister of Justice, and addressed to the *procureurs-généraux* throughout France. The circular first saw the light in the columns of the London *Times*, the French correspondent of that paper having got possession of it in some way, greatly to the astonishment and chagrin of the French press. As published in the *Times*, the Minister (who is looked upon as a representative of liberal opinion) called the attention of the *procureurs* to the establishment of a republican government, and requested from them information as to the progress being made "towards perfectly established social order." He wished to know whether the jury bill passed in 1872 had aroused the hopes of the friends of order; whether, if the jury has proved sufficient for offences against the common law, it has equally protected society "against crimes and offences committed by means of the press, or all other ways of publicity"; whether, and in what cases, it had been found necessary to suppress, suspend, and prohibit the sale of papers in the streets. He then calls the *procureurs'* attention to "another kind of infraction of the law," less grave in itself than those which come before juries, but which by repetition with impunity would end "by resuscitating all the uneasiness which the constitutional laws should dissipate." This infraction of the law has consisted of "an unwonted deluge of photographs, drawings, emblems, and of publications, in which historical truth is not less belied than patriotism and good sense." He thinks the *procureurs* must have seen "whether this vast colportage was authorized," and must have deplored being obliged to punish subordinates "while those who sent them forth, who furnished them by thousands with the instruments of their misdemeanor, escaped by a defect in the penal laws from all responsibility." He also added: "The law which is wanting must be framed. You will give me your opinion on the form which it ought to take." This circular, which was directed at "all the parties," was kept back for a day or two, and then, after having appeared in London, and come back and gone all over France, was officially published, with one or two modifications—the passage referring to the suspension and suppression of newspapers being omitted, and the suggestion about the necessity of framing a new law being put in a hypothetical way. But the modifications are not serious, and the only thing the circular can be said to show is the determination of the Government to use all the means at its disposal to suppress discontent.

---

M. Wallon, to whom we owe the present constitution of the French Government—what has been called the Wallonate—seems well-fitted for the rôle of a saviour of society. As the Minister of Public Worship, he has infused new life into the languishing and almost despairing Liberal wing of the French Protestants, whose troubles have been frequently related in these columns. This he has done by a simple manifestation of his desire that they should obtain justice and be protected from persecution. The fatal gift of a Synod, procured of the Thiers Government through the influence of M. Guizot, produced a schism which was aggravated by the late ministry of MacMahon. Anti-Orthodox elections, conducted in disregard of a sort of iron-clad oath imposed by the Synod, were set aside as null, and great confusion was thus caused in churches where the Liberal Protestants were decidedly in the majority. Further troubles were obviously in store for them, but their anxiety is now over. A delegation which they sent up to Versailles had an interview with M. Wallon, and demanded equal treatment from the Government for themselves and their Orthodox brethren. They denied the right of the Government to expel so considerable a fraction from the Reformed Churches of France, and to erect it into a new sect to be dealt with specially. Separation, with retention of their own property, they would agree to, but they would not surrender their title to an unbroken descent from the Huguenots. M. Wallon replied that he was disposed to regard the differences in the Protestant Church not as a question of faith but as one of good or bad judgment in contention. He preferred, however, that the issue should first go before the Council of State for decision. There is little doubt that the solution proposed by the delegation will be reached. A year ago the Liberals were reluctant to entertain it, but what has happened meantime has convinced them they had better part company altogether with the Orthodox. and save their church property while they may. To this the Orthodox can hardly offer a serious resistance.

---

The Italian army numbered last autumn 840,000 men. About five-eighths of these constituted the standing army, and one-third of these again were under arms. The levy of the class born in 1853 was responded to by 296,113 young men, less 10,574 (called *renitenti*, or contumacious, for not putting in an appearance). The percentage of the absentees was thus 3.86 of those enrolled on the list; the year previous it had been only 3.71, showing an increase in the emigration to America. In certain provinces the percentage was very serious, as in Genoa (23.38), Naples (16.68), or Palermo (15.78). The army nevertheless continues to grow, and if it is the main cause of the annual deficit of the kingdom, it is also a powerful instrument of national regeneration. Instruction has been made obligatory in the army, and the number of illiterate soldiers at the end of the three years' service is steadily diminishing. The classes of 1845, 1846, 1847, with whom instruction was optional, went out of service with 43.51, 40.41, and 34.95 per cent. of their number still illiterate. On the other hand, the classes of 1848, 1849, 1850, retired with only 14.6, 8.89, and 7.45 per cent. illiterate. The machine of course works slowly. More than half the net product (for the standing army) of the levy of 1873 belonged in the category of the *analfabeti;* 41,829 could both read and write, 3,127 could write only, the rest (54.24 per cent.) neither. This is better than was the case with the class of 1849, called into service with 56.99 per cent. of *analfabeti;* but the class of 1850 embraced at the outset only 53.78 per cent. Satisfactory progress in the regimental schools is now made a condition of dismissal. Two-thirds of the recruits come from the ranks of farm-laborers, shepherds, drovers, and mechanics, and the value to them of their military schooling is incalculable.

## THE WHEELER COMPROMISE AND THE "BANDITTI."

THE adoption by the Louisiana Legislature of the "Wheeler Compromise" gives the House of Representatives to the Conservatives and the governorship to Kellogg for the remainder of his term of office, and at the same time guarantees him against impeachment for past offences. This probably ends the political turmoil which has been going on in the State since the election of 1872 in the only way it could have been settled, and will give a much-needed opportunity for the restoration of confidence and the revival of industry. It is hardly likely that between now and December there will be any renewed disturbances, and the thorough frightening the Republicans have received in the past few months by the Democratic victories has probably awakened the Republican leaders to the importance of letting the South alone for the summer at any rate. Indeed, within the past week we have met in an Administration organ with the most amusing elicitations on the orderly and peaceful condition of Arkansas, attributable, we are told, to the wise moderation of the last Congress.

From more than one point of view, we must say that we look upon the Wheeler Compromise with profound satisfaction. It is not merely that it pacifies an important State, and relieves the entire public of the anxiety which has filled every mind with regard to it for the last year or two, but it throws a great deal of light on the question of the general sobriety, intelligence, and capacity for self-government of the Southerners, and completely upsets the wild theories with regard to their habits and disposition which the politicians have invented within the last few years. Down to the time of the war, though there were wide differences of political opinion between Whigs and Democrats, and between both and the Free-soilers, the general theory of politics on which they all acted was that differences were to be settled in the American way, by votes, or in the courts, if political questions took a judicial form; that the Constitution was the supreme law of the land, and that all questions must be settled under it; finally, that the voting population of the country, North and South, were amenable to reason, and would give up a hopeless cause when they once saw it to be hopeless. The war seemed for a time to make the truth of this theory doubtful, but only for a time, and at the end of it the Southerners, without trying to keep up a desperate guerilla warfare, as many people supposed they would, gave the best proof that they were not very different from the rest of us by throwing down their arms and submitting to the terms that were imposed on them. All this was very encouraging to those who hoped for the welfare and prosperity of the South, for it was obvious that the South must be governed by the Southerners, and the character of the government must be determined by their character.

Within the past four or five years, however—that is, since the Southern whites have begun to recover from the stupor which paralyzed them at the end of the war, and have undertaken the actual government of their States—a new and strange theory has been propounded with regard to them by the extreme Republican politicians, which if it had been true would really have inclined every well-wisher of his country to hopelessness, and prevented him from caring even for the result of the "fall elections." According to this theory, the South was inhabited by a wild, semi-barbarous tribe of men, known as "ex-rebels," speaking, indeed, the same language with ourselves, and like ourselves wearing clothes, but having hardly any other traits in common. Unlike civilized people, they engaged in no pursuits of any kind, agricultural, industrial, or commercial, but spent their time in roaming about the country armed to the teeth with every kind of weapon, offensive and defensive, which they used in promiscuous attacks on Union men, one-legged soldiers, or negroes. Sometimes in the dead of night they banded themselves together and had a night's pleasure in cutting negroes' throats, and sometimes they contented themselves with threats, "ostracism," and "intimidation." They did all these things without any provocation, for the love of crime and lawlessness; and the natural conclusion to which the theory pointed was that they must be dealt with by the troops, by court-martial, and that with such wretches the writ of habeas corpus was a mere cover for bloodshed and rapine. When Sheridan went down to New Orleans and announced that he found the State full of "banditti," and that they must be disposed of as rapidly as possible without regard to law, the theory was only pushed to its logical conclusion. As a matter of fact, if Sheridan had been asked to point out some of these "banditti," he would probably have been obliged to select some white-haired old merchants of New Orleans, known there as "prominent Conservatives," to whom a night spent in intimidating negroes in the swamps would only have been unpleasantly suggestive of chills and fever. But for all that, Sheridan's "banditti" despatch was at once caught up by the Northern extremists as a happy demonstration of their theory of the "ex-rebels," and most of the time of the last Congress was spent in trying to arrange legislation based on it.

This would undoubtedly have been a natural way of managing the government if the Southern Whites were bloodthirsty cut-throats and outlaws, whose only passion in life was to make the negro's life miserable to him, to prevent him from working, and to "ostracise" Union men. On the other hand, the natural way for cut-throats and outlaws to behave when they found that the United States was really not going to allow them to vent their passions at will upon the negro and the Union man, would have been either to submit in sullen silence to their punishment or else stir up more trouble, and make the State uninhabitable, by secret assassinations and a petty and empty system of revenge. Assassination was one of the things most commonly predicted at the time of Sheridan's "banditti" despatch if severe measures were not taken. Nevertheless, when we ask ourselves, What have the banditti actually done? we are compelled to admit that they have shown just that spirit of conciliation and compromise which has distinguished the Anglo-Saxon race in political matters for centuries—have taken what they could get, and relinquished what they could not get, with a prudence and moderation worthy of Massachusetts or Michigan.

In the first place, it must be remembered that the Conservatives have always maintained, with a very good show of proof, that they carried the election of 1872, and that Kellogg has no right to the office of governor. In the second place, they maintain—and as to this there is no doubt they were right—that they were defrauded of the election of 1874 by the Returning Board, and that a number of the members of the legislature were actually turned neck and heels into the street by the troops of the United States in order to arrange the majority to suit the Republican politicians. In fact, since 1872 the majority of the people of the State have by force been deprived of all voice in the government. Notwithstanding this, there has been no resistance to the United States. Even in the midst of the only rising which took place during this period, at the mere name of the United States all disorder ceased, and the means of redress sought have been appeals to and arguments before Congress or the Executive. When, last winter, a sub-committee of Congress went down to New Orleans to examine into the last election, they went before it and stated their case; when this sub-committee reported at Washington, and the rest of the committee then went down in its place, they did it over again. Of course, they did not recognize any right in the United States to carry on their government, but they tried to get the best they could. Finally, when the whole matter was taken in charge by Mr. Wheeler, who had no more real authority in the matter than King David Kalakaua, the Conservatives went over the case with him, too; and now their moderation and good sense are rewarded by obtaining in this somewhat extraordinary way a part, if not all, of their rights. In short, from first to last the "banditti" have behaved just as we should have behaved under the same circumstances, and in the same sort of way that our ancestors behaved a hundred years ago in meeting the oppressions of England. As a proof that the South is not lacking in those political qualities which have made the country at large prosperous and happy, the Wheeler Compromise should not be overlooked.

## THE SUPREME COURT ON THE LOBBY.

MR. NICHOLAS P. TRIST, the readers of the life of Jefferson will remember, married the grand-daughter of the great Virginian, was present at his death, and received his last words. At the close of the Mexican war, Mr. Trist was the Commissioner of the United States who negotiated the peace concluded by the Treaty of Guadaloupe-Hidalgo. In the course of his service as Commissioner, and while hostilities were still in progress, Mr. Trist passed through the military lines, incurred some dangers, and also some expenses. The result was that he had a claim against the Government which was not paid at the close of the war. With regard to this claim, as with regard to any other, two things are tolerably evident: first, that if the United States owed Mr. Trist for moneys expended on their account, it was their duty to pay him; and, second, that if his claim was just and legal, he should have been paid without any extraordinary delay or being put to any extraordinary cost. Nevertheless, twenty years passed, and this claim remained unsettled. We have repeatedly shown that the manner in which the executive branch of the Government is carried on produces an immense horde of professional office-seekers or politicians (for the terms are convertible); and we now have occasion to add, that the manner in which the legislative branch of the Government is carried on produces another and smaller but scarcely less mischievous horde, called a professional lobby. For an aged citizen of the highest respectability to get a just claim paid by the simple process of asking for it, or going before Congress himself with his vouchers and evidence, would have been, practically speaking, an impossibility. So Mr. Trist, after pondering over the propriety of the matter for twenty years, did what almost every one else in like circumstances would do, he employed one of the lobby, or, if not one of the lobby in the depraved and obnoxious sense of the word, still he employed an agent, to work the claim up and get it through, in consideration of receiving one-quarter of it. In 1870, Congress passed a bill for the relief of Mr. Trist appropriating for that purpose $14,559 90.

In the meantime, the agent had died and his son had succeeded to the business and to the bargain; but him Mr. Trist refused to pay, upon the ground that the business had been grossly neglected, though he offered to pay a reduced amount. Thereupon, the agent applied to the Treasury to stop the payment of the money to Mr. Trist, which the Treasury kindly did, and the agent next walked into the Court of the District of Columbia and filed a bill in equity to enjoin Mr. Trist from receiving any of the money appropriated to him by Congress. The Court granted this injunction, and rendered a final decree against Mr. Trist, from which he appealed to the Supreme Court. The money remained in the Treasury pending the appeal, and Mr. Trist died without ever receiving a cent of it. Since his death, the appeal has been brought to a hearing, and the Supreme Court, passing by, with a mere allusion, a number of fatal objections to the decree of the Court below, has boldly set its unanimous condemnation upon the entire transaction, dissolving the injunction, reversing the decree, and stamping all such contracts as contrary to public policy and morality, and as absolutely void.

That this decision shall not be misunderstood as being confined to an exceptionally bad case, the Supreme Court has taken care to say that the agent is represented "to have been a lawyer of ability and high character" and his son "to be equally worthy"; and the Court also adds that there is no reason to believe that their services "involved anything corrupt or different from what is usually practised by all paid lobbyists in the prosecution of their business." "Nevertheless," says the Court, "the theory of our Government is that all public stations are trusts, and that those clothed with them are to be animated in the discharge of their duties solely by considerations of right and justice and of public good. They are never to descend to a lower plane. But there is a correlative duty resting on the citizen in his intercourse with those in authority, whether executive or legislative, touching the performance of their functions. He is bound to respect truth, frankness, and integrity. Any departure from the line of rectitude in such cases is not only bad in morals, but involves a public wrong." "If," pursues the Court, "the instances were numerous, open, and tolerated, they would be regarded as measuring the decay of the public morals and the degeneracy of the times. No prophetic spirit would be needed to foretell the consequences near at hand."

This is very plain language, coming from the highest tribunal in this country, and language very much needed at this time. We all have reason to be grateful to the Court for not putting its decision upon some of the technical objections which would have been equally fatal to the case from a legal point of view. The Supreme Court has been at the pains to say, in a manner not likely to be forgotten or misunderstood, that all and the best of the present lobby business in Congress is pernicious, immoral, and void; and it has also indirectly read the Court below a pretty strong lecture upon the impropriety of a judicial tribunal lending its aid to carry out these nefarious transactions. Indeed, "the degeneracy of the times" seems to be somewhat indicated by the fact that the lower Court, composed of lesser men, several of whom have been members of Congress and politicians, should have thought a lobby contract as good an agreement as any other, and as much entitled to the assistance of a court of equity.

But what is a man circumstanced like Mr. Trist to do? Is he to come to Washington and spend winter after winter accomplishing nothing? Is he to spend half a lifetime in witnessing a meritorious bill for his own relief pass the Senate at one Congress and the House at another Congress, and never succeed in passing both at the right time? Is he to stay at home and amuse himself by writing petitions and letters to members to present and throw into waste-paper baskets? Is he to forego all hope at the beginning, and with anger and the knowledge of injustice in his heart go through life wronged by a country that is able and not unwilling to do justice to all its creditors? What Mr. Trist's lawyer told him he must do was this: After writing to all the members he knew in Congress, he must write to his "friends to write to any member of Congress. Every vote tells, and a simple request may secure a vote; he [the member] not caring anything about it. Set every man you know at work, even if he knows a page, for a page often gets a vote." In conjunction with this advice, let us consider for a moment how very easy the process must be of procuring just legislation for private claims. "A simple request may secure a vote." Why? "Because the member does not care anything about it." Even if a man knows a page in Congress let him write to the page, "for a page often gets a vote." These pages are, as our readers are aware, very small boys, nimble-footed and quick of eye, who run with messages to the Speaker's desk. How very gratifying to every lover of his country to reflect that, in the modern Congress, "a page often gets a vote." With legislation moving year after year, and Congress after Congress, and party after party, upon such wheels as these, what is the citizen to do who desires and is entitled to receive legislative aid? Is it a wonder that a lobby exists? Is it not evident that a lobby is the product of Congress; that the atrocious complexities of the system, and the still more atrocious want of system to which we have been for years calling attention, render a lobby inevitable, and will continue to keep a lobby in existence despite the condemnation of the courts and the invectives of the press, and even despite the penal statutes which Congress may see fit to pass? That a demand produces a supply is one of the well-known laws that govern trade, and this work of collecting the debts of the Government is to a certain extent trade. A disorganized, incompetent Congress is a continuing, abiding demand for a lobby, and it is a demand which has not hitherto failed and will not hereafter fail to produce a supply. Whoever wishes the lobby annihilated must first see to it that the business of Congress shall be conducted in such a way that it can with reasonable certainty be done without a lobby.

The King of the Lobby, as Mr. Ward is termed in Washington, during the last winter pictured to the Committee of Ways and Means the business of the lobby, and drew the somewhat partial conclusion that it is a business in the legitimate sense

of the word, having for its precedent and parallel the English parliamentary lawyers. There is really no parallel between the two. The Supreme Court, in the case which we have hitherto considered, has very clearly drawn the distinction between what is proper and what is immoral in this professional assistance. "We entertain no doubt," says the Court, "that in such cases . . . an agreement expressed or implied for purely professional services is valid. Within this category are included draughting the petition to set forth the claim, attending to the taking of testimony, collecting facts, preparing arguments and submitting them orally or in writing to a committee or other proper authority, and other services of like character. All these things are intended to reach the reason of the person to be influenced. They rest on the same principle of ethics as professional services rendered in a court of justice, and are no more exceptional." During the last winter Congress seemed for a time inclined to act on the information, which it obtained apparently from Mr. Ward, and entertained a project to set up a bar of parliamentary lawyers in Washington. This bar it was intended should be limited by statute to very nearly the same kind of services which the Supreme Court has indicated to be proper. The compensation was to be fixed or limited, and they were not to engage in the business of "buttonholing," or "requesting," or setting pages "to get votes."

This project is very well in its way, and has the merit of looking in the right direction; but it must be the sequence and not the initiative of Congressional reform. The most exemplary bar in the world will not secure to us a well-ordered, intelligent Congress. Respectable professional assistants in the administration of justice will not be effective until we have some justice to be administered. No one outside of Congress would think of setting up a profession of attorneys and counsel before we establish a court for them to practise in. So long as we maintain a system which requires members to be "seen" and "requested" and induced to vote by little boys, the most austere bar of parliamentary lawyers will not "get a bill through." The English system requires parliamentary lawyers because it secures to every petitioner a strict parliamentary trial. And this will be better appreciated when it is understood that the system embraces the following elements: 1st. All applications for private bills must be filed and advertised before the beginning of the session. 2d. A sworn committee of each House then makes up impartial committees, and assigns the applications to them. 3d. The members of these committees are bound to declare any bias or interest either of themselves or of their constituents if it be a local measure. 4th. Any person interested either for or against a bill may challenge a member of a committee as he would a juror. 5th. The committees sit with open doors and try the case, keeping and reporting to the House an exact record of their proceedings. Finally, when they report for or against the bill, it goes upon a calendar, and is as certain to be reached and acted upon in its order as a lawsuit upon the trial docket of a court of justice. Compare this system with one which selects a few favored measures and gets them through (according to Mr. Ward) by giving costly dinners to hungry Congressmen, and it will be seen how preposterous is the hope that a parliamentary bar will immediately supplant the lobby. The only reliance of those who wish well for national legislation must be in the resolute demand of all thinking men that private bills and special legislation be gotten out of Congress. The conclusion of the whole matter is that special legislation breeds a lobby, and a lobby breeds fraudulent claims and the corruption of Congress.

## MODERN ENGLISH COMEDY.

LONDON, March 27, 1875.

IN one of the most interesting books recently published in this country, 'Macready's Reminiscences,' an account is given of an unsuccessful venture made by him in 1837–38 to regenerate the national drama. He became manager of Covent Garden Theatre, engaged an excellent troupe of performers, spared no labor nor expense, produced nothing but the highest classical dramas, chiefly Shakspere's, and brought both himself and the theatre to the verge of ruin. Since his trial, several attempts have been made by enterprising managers to revive a taste for the higher class of dramatic performances, but they have invariably failed. Everything has been tried, but very little has come of it. Melodrama crushed out the national drama, and under the auspices of Mr Dion Boucicault it was moderately successful for a time. But just as melodrama destroyed the national drama, so burlesque destroyed melodrama. For the last ten years or so the whole mimetic energies of Shakspere's countrymen and countrywomen have been devoted to writing, acting, and seeing fantastic travesties of the legendary myths of early classic and prehistoric times, and to reproducing in coarse English phraseology and by coarse English actors and actresses the indelicate conceits of Offenbach and Lecocque. By such performances, and by no other means, have the descendants of Garrick, and Foote, and Macready been enabled to fill their houses. Young officers, clerks in public offices, and tradesmen's apprentices have been lured from their clubs and lodging-houses by the graceless attractions offered at the different burlesque theatres, and the theatres have not been slow to outrival each other in their allurements. Things had come to this pass, that no man or woman with any appreciation of wholesome amusement, or indeed with any sense of modesty, could venture within the walls of nine out of every ten theatres in London. But when matters get to their very worst they begin to mend, and this year, I am glad to say, the tide of propriety has commenced to flow.

Among the miscellaneous duties attached to the office of the Lord Chamberlain is the "oversight of the Queen's musicians, comedians, trumpeters, etc.," and all theatres in towns in which a royal palace is situated require to be licensed by the Lord Chamberlain, and no new play can be produced anywhere without his license. The Lord Chamberlain, who is a very high officer of state, a member *ex officio* of the Cabinet, though he never attends it, and overwhelmed with more prominent if not more important functions, does not himself discharge the censorial duties of his office. He has an "Examiner of Plays," who licenses new plays or adaptations of old ones, inspects all the theatres under the Lord Chamberlain's jurisdiction, grants or suspends or withdraws licenses, and generally devotes himself to the propriety of the theatres. Some months ago the examiner, who had, perhaps, grown too old in the service, was succeeded by a man of determination and ability, and his whole energies have been given to the purification of the theatrical stables; and, considering the short time he has been employed in this good work, he has swept them fairly clean. Licenses have been refused in more than one instance, and censures and warnings have been freely administered. The effect of this energetic action has been that several theatres have changed hands, new programmes have been prepared, a different stamp of performers has been engaged, a wholesomer tone pervades the theatrical atmosphere, and three or four different houses are filled every night by ladies and gentlemen who have hardly been within the doors of a London theatre, except during the opera season, for years.

One small theatre, the Prince of Wales's, has, during all this time, maintained itself with perfect propriety, and, by the careful selection of the pieces performed and the excellence of the leading performers, it has succeeded in gaining a considerable reputation both as a theatre and as a training-school for actors. It is a bijou-theatre, not much bigger than a large-sized drawing-room. Both stage and auditorium are tastefully and appropriately fitted up; the company is small but admirably chosen; and the orchestra, which is efficiently trained and conducted, performs not in the body of the house, but underneath the stage—an arrangement which has the double advantage of gaining space and moderating or deadening the sound of the more ambitious instruments. In this little theatre what may be called modern English comedy has been chiefly performed. Among the writers of this modern comedy the late Mr. Robertson is the most eminent. His plays are, like Mr. Trollope's works, slight, easy, and unimpassioned. Not one of them can be said to have a plot of any real interest, but by skilful dialogue, a nice arrangement of contrivances which are effective on the stage, and a delicate insight into the kind of everyday incidents that amuse or interest the public, he has managed to make almost every play he has written fairly successful. His best known pieces are "Play," of which the scene is laid at Baden-Baden, in the good old gambling days, during the summer months when it is thronged with English tourists radiant with eccentricities; "Ours," in which the Crimean War figures prominently, and English vanity is flattered by the opportunity of gazing upon the fortitude of British officers braving the horrors of a Crimean winter and being jolly under the most trying circumstances; "Caste," in which the English notion that one man is not as good as another, if the one man belongs to the aristocratic classes and the other does not, is pleasantly ridiculed; and "Society," in which the struggles of the *nouveaux riches* to get into society by the power of "the check-book" are feelingly and amusingly portrayed.

These plays were all, I think, written for the company at the Prince of Wales's Theatre, and they have mainly contributed to its popularity. There is very little in any of these pieces, or indeed in any of Mr. Robertson's plays, that could offend the most critical taste, or perhaps even the most prudish. But there is a curious sameness and want of versatility in the leading idea of nearly all of them, and that idea is the superiority in the world, and especially in the matrimonial world, of intellect and refinement over money. There is nearly always an interesting student, a man of letters, of good family but impoverished means, a wealthy member of the commercial classes trusting exclusively to his money, and a beautiful and accomplished heiress—generally an orphan. Designing aunts or worldly mothers intend the heiress for the millionaire, but destiny is too strong for them, and the heiress marries the pauper. This is the string on which Mr. Robertson always plays. There is not much novelty nor originality in it, but, thanks to the excellent acting of the company and the careful attention to all the dramatic proprieties and situations in the several pieces, it seems never to pall upon the audience. There is but one drawback to the success of this house, and that is its situation. Professional and social exigencies have so ordered life in London that your whole day is disarranged each time you think of going to a theatre. People breakfast late, go late to work, come home to a late dinner, and after dinner it is too late to do anything but go to bed. Public offices follow Parliamentary hours and do not open much before mid-day. If a man has anything to do, and does not begin to do it till twelve o'clock, he cannot finish it till six or seven ; and as the theatres generally commence about those hours, it is obvious that, if they are situated some miles from where most people live, most people will not go often to them. The Prince of Wales's Theatre has always suffered from this inconvenience, and though it has done its best to counteract it by commencing as late as theatrical customs permit, it has only partially succeeded.

Seeing this inconvenience of situation, and desiring to attract the best kind of audience to his house, Mr. Hare, for some years the leading comedian at the Prince of Wales's Theatre, has just opened the Court Theatre, on the skirts of Belgravia, and it is expected that, during the season which commences after Easter, this house will be well frequented. I went there on Thursday night, and, although the Easter recess had commenced, and people were flocking out of London all day, and many do not care to go to places of amusement on Good Friday Eve, I was surprised to see so good a house. The building is small, but, in all the splendor of its new decorations and fresh colors, it looked bright, and clean, and promising. The piece performed, 'Lady Flora,' has been written by a new play-writer in avowed imitation of Mr. Robertson ; it is even said that it was written for a bet in some surprisingly short space of time—twenty-four hours, I was told—to show how easily Mr. Robertson could be imitated ; and the author, it must be admitted, has caught to perfection the manner of his model. The Lady Flora is the ordinary heiress of Mr. Robertson's play, without father or mother, but with boundless wealth. She has been engaged since childhood to her cousin, a jolly, good-looking, rollicking Englishman, fond of shooting and hunting, and very little else, a sort of refined Tony Lumpkin of the present day. He has a couple of friends staying with him—a sporting squire and the tutor or "coach" of his college. There are two other characters—an old Anglicized French duke and his ward, Sophie Duchesne by name, who returns home from India unexpectedly, and, after turning her guardian's house upside down, completes the catastrophe by assisting Lady Flora to transfer her affections from her cousin to his "coach," and by engaging herself to Lady Flora's cousin. There is not much in such a play. It wants plot and point, and, if badly acted, would be dull. But it moves pleasantly from scene to scene ; the dialogue is sparkling and easy ; the situations are natural, and the acting is admirable. A comfortable theatre, within easy reach of most people's houses, an excellent company, well-selected, amusing plays, refined acting, and an entire absence of impropriety, are not often found in combination in this country. If this revival or adaptation of good modern English comedy should be as well supported as it deserves to be, we shall have a new source of legitimate amusement in this metropolis for which many of us will be grateful.

## PROGRESS OF THE CHURCH CONFLICT IN PRUSSIA.

BERLIN, March 28, 1875.

THE prediction I ventured to make in my last letter has been fulfilled, viz., the funds hitherto contributed by the state for the maintenance of the Roman Catholic Church in Prussia are no longer to be paid to any of the archbishops or bishops contravening the laws of the state. Dr. Falk declared that the measure had not been brought about by the Encyclical of February 5, though it was due to this last *brutum fulmen* of the Vatican that it was already at so early a day submitted to the approval of the Landtag. This statement is of importance as a further proof how firmly the Government is resolved "to fight it out on this line." It may also perhaps be taken as an indication that the rumor was not without foundation that, in case the bishops had dared to make an official publication of the Encyclical, a sweeping removal had been decided upon by the Government. And everything else points the same way. Nothing new is said in the debates on the Church question—it would, indeed, be hard to find anything new to say about it—but the manner in which things are said has undergone a considerable change. On the side of the State party there is comparatively very little feeling shown, but their adversaries are handled in a much rougher way. Bismarck has very clearly pointed out the two reasons of this remarkable change. Windthorst had again sought shelter behind the shot-and-shell-proof rampart of the Ultramontanes : the command to obey God rather than man. Amid the applause of the majority, Bismarck followed on his heels and sat down close by his side. He declared that he not only entirely agreed with the gentleman from Meppen, he (Bismarck) was really convinced of that eternal truth and acknowledged its binding force without any reservation ; hence he could not, upon the bidding of the Pope, war upon his king, to whom he owed obedience by the law of God, but would, from the fulness of his heart, repeat the old Prussian war-cry, "With God for king and fatherland." The Ultramontanes, and they alone, could not join him in this war-cry, therefore they, and they alone, stood as enemies against all the rest of the people. Never before has this been said with such directness by any of the ministers, because it is only now that they have given up all hope, not only of a reconciliation, but also of any compromise for a long time to come. They are satisfied that they are to have war, and consequently they are determined to wage it as a war must be waged in order to be successful. And they feel much surer now that they will wage it successfully than they did a year or even six months ago. Windthorst had boasted of the growing strength of the Ultramontanes. "Ah, gentlemen," Bismarck replied, "rest assured I too have grown stronger." Windthorst proves how well he is aware of that by crying at the top of his voice, like an auctioneer, liberal notions of the best-approved pattern. But the mice have their suspicions about bacon roasted in that kitchen. Of this a word or two presently.

The Government does not pretend that the withdrawal of its contribution to the support of the Catholic Church can of itself have any material effect, because it amounts to only about a million thalers. The sum, though large enough to be regretted, is altogether too small to work as a check upon the Church's power of action. Bismarck calculated that, if he had to appraise the Holy Father and his Jesuits, he would put them down for about 200,000,000 : he thought he had pretty good information, and this estimate was not any too high. And this sum he declared amply sufficient not only to live upon quite comfortably, but also "to take part in the game of high politics." So he is far from deceiving himself about the direct force of his last blow ; on the contrary, at the outset, he spoiled the pleasure of his adversaries in afterwards taunting him with its ineffectiveness. At the same time, he stated with great precision and directness why he had dealt it, nevertheless : we cannot afford to serve as a laughing-stock to the whole world for furnishing, ourselves, to our enemies the means with which they fight us. It is this declaration which makes the provisional and conditional withdrawal of the contribution perhaps the most incisive measure the Government has thus far ventured upon. Even from the most simple-minded peasant the fact can no longer be concealed that the Ultramontanes will, in the fullest sense of the term, be considered as enemies of the state so long as they do not unreservedly submit to the supremacy of the law. It is a question of sovereignty, and they have to make their choice whom they will acknowledge as sovereign. Bismarck had already defined his standpoint with the utmost clearness when he said, two or three years ago : "Sovereignty is one and indivisible, the sovereignty of the laws."

From the purely material point of view the Ultramontanes will, in the course of time, suffer much more from the new law which secures the communities a share in the administration of church property. The opposition to this law was comparatively weak, because the great majority of the Ultramontanes did not dare to claim the ownership of the church property for the church taken as a whole. Only one delegate—it should, however, be mentioned that he was a Polish priest—was bold enough not only to assert that, but also to draw the conclusion from it that in fact the Pope, as the head of the Church and the *vicarius Christi*, was the only and absolute owner. Windthorst, without exposing himself in such a gross

manner, actually came to about the same conclusion. He declared "the hierarchical constitution" to be "the nature, the true essence of the church," and therefore the administration of the church property had to be left entirely to "the hierarchy." The Government-Commissioner Foerster met him by reminding him that the *Obertribunal* (Superior Court), in conformity with the *Landrecht*, had declared the communities to be the owners of the church property, and therefore everything relating to the church property had evidently to fall under the civil law. It was the honest truth when Dr. Falk asserted that this was quite a general question, "an organizing law," and that it could not, with justice, be counted among the "conflict-laws." On the other hand, it is undeniable that it has been the conflict which has caused the Government to clear away the old rubbish from this "general question," in regard to which hitherto hardly anything was clear and certain but that the Minister Ladenberg, by a circular of January 6, 1849, had renounced all the rights of the state in favor of the bishops. And it is as undeniable that, in the long run, the law will do a good deal towards emancipating the Catholics from Rome, by getting them gradually accustomed to think and to act for themselves. An immediate effect is as little to be expected from it as from the older law, which, in certain eventualities, gives the community the right to elect themselves a priest. Both these laws are steps in the right direction, and if not we, at least our children will live to see their beneficial effect. They both carry the principle of self-government into the church, and that is indeed much gained. But self-government, in order to be beneficial, must be a plant of slow growth. This the liberal parties are aware of, and they have made up their minds to work and wait with patience, while the leader of our Ultramontanes affects to ignore entirely this all-important truth, which has been the great stumbling-block of the French since 1789.

Windthorst has learned something from Bismarck. You remember how Bismarck, in the first great crisis of his revolutionary political career, tried to effect a sudden turn in the strong current of public opinion by promising a German parliament and universal suffrage. These promises apparently stood in such a contrast with the former policy of the "Junker" that all over South Germany they were considered as absolutely ludicrous. I remember a well-known professor in Heidelberg saying: "These baits, held forth by this hand, are not good enough to entice a dog from behind the stove." Now, Windthorst seems to think us sufficiently accustomed to such sudden changes to treat us also on his part to such a jump from midnight into bright noonday, forgetting, however, the old Roman adage: "*Si duo faciunt idem non est idem.*" The other day he declared in the Landtag that no peace was possible until we adopted the American system, viz., the complete separation of church and state. Bismarck's bold bidding for the favor of liberal men was grimly laughed at because one did not as yet know the man. Windthorst's bidding for the favor of the doctrinarians among the Liberal parties and of the unreflecting masses was forgotten the very day it was made, because the system he represents has been known these fifteen hundred years. Windthorst's separation of church and state has as little to do with the American system as a bagpipe with Mozart's sonatas. In the very same speech he demanded "at least" a separate *Catholic* Minister of Worship (*Cultusminister*). This demand very clearly shows what his system is, which, if consistently carried out, would require a separate Minister of Worship for the Calvinists, Jews, Mennonites, etc., etc. It has to be kept well in mind that our Minister of Worship has nothing whatever to do with religion as such, and this is what Windthorst wants to do away with as a first step towards introducing the American system. Certainly no American need be told that as soon as the churches, not as organizations and corporations with certain rights and privileges under the laws of the state, but as the exponents of certain religious creeds, became the object of the official duties of the Minister of Worship, all the fetters would be broken which thus far have chained down religious intolerance, fanaticism, and persecution. Separation of church and state in the mouth of a Windthorst simply means that the sovereignty of the state shall not extend over the Roman Catholic Church as a civil organization and incorporation, and I have yet to learn that this is the American system.

There is, however, yet another and much more important side to the question. We have not to ask: How has the American system worked in the United States? but, How would it work with us? And even more: we could hardly get so far as to put this latter question, for it must be clear to every calm and sober observer at first sight that at present it would be absolutely impossible for us to make the trial. We have to deal with institutions whose age is reckoned by hundreds of years, and which have in such a manner grown into our life as individuals and as a social and political body, that to tear them asunder with one jerk might prove fatal to our very existence as a nation and as one of the leading peoples of the civilized world. Look at the first Revolution of France, and you will see the awful consequences of such a clean, sharp cut into what has *grown* into existence in the course of centuries. One must not forget that these institutions are not mere artificial creations. To blow them up over-night is to stab the mass of the people to the very heart in their received ideas, in their cherished habits, in their deep-rooted prejudices. The mass of our people are about as well prepared to see the American system adopted on a sudden as they are to bow their knees once more to Odin. Look on the Government—this Government, leading the onslaught of the Liberals on the Ultramontanes—and you will see how well we are fitted for a separation of church and state. Only four weeks ago I wrote you about the new law rendering civil marriage obligatory; now I have to write you that in Potsdam a teacher has been dismissed because he did not go with his bride to a clergyman after having contracted his marriage before a civil magistrate. Dr. Falk felt the unspeakable shame and scandal at least so much as to pretend that there had been also some other reasons at work. But you find prominent men among the Liberal parties openly and unreservedly justifying the course of the Government.

It would take not only a very conceited man but also a very superficial thinker to venture at this time to predict where we shall finally land in this conflict with Rome. Perhaps it will be at the American system, perhaps at a very different thing. Those who are able to look beyond the incidents of the day, and who understand the true nature of this war, should not merely ask where we are standing just now. Let them not turn their backs upon us because we have not yet arrived here or there. Honest and candid criticism we invite, but we think ourselves entitled to sympathy and to a word of cheer as long as we move, if, upon the whole, we are moving in the right direction.

# Correspondence.

## MILTON'S AND SHAKSPERE'S VOCABULARIES.

To the Editor of The Nation:

Sir: I beg you to allow me space in your columns for a word in reply to a paragraph in the *Nation* of February 25, 1875 (p. 134), quoting from Professor Holden some strictures upon my estimates of the number of words composing the vocabulary of most writers and speakers, and especially of the poems of Milton and the dramas of Shakspere.

On pages 181 and 182 of my 'Lectures on the English Language' I spoke on both these points, observing as to the first that most persons "use *for ordinary purposes* but a very small proportion of the *words they have at command*," and I went on to say that "few writers or speakers use as many as ten thousand words, ordinary persons, of fair intelligence, not above three or four thousand." I certainly did not suppose that any intelligent reader could misunderstand me as meaning in the second of these clauses any different *use* of words from that indicated in the *first*. In justice to Prof. Holden, I ought to say that I know nothing of his criticisms except as they are reported in the paragraph referred to, and therefore it is possible that he may have been aware that in estimating the number of words at "his command" at 30,000, he does not in the least impugn the statement I made as to the proportion of words "at command" used "for ordinary purposes" by most writers and speakers, for I expressly said that some orators were able, upon occasion, to employ one-half of the vast stock of words composing the English tongue, which I estimated roughly at one hundred thousand.

With respect to the poetic and dramatic vocabularies of Milton and Skakspere, Prof. Holden's statistics are entirely erroneous, at least if we use *word* in the sense in which, in such discussions, all philologists would agree in employing it, while my own, I believe, will be found to be strictly accurate. I did not think it necessary to state what I supposed the public I addressed could not fail to understand, namely, that in estimating the number of *words* I took only the simple or stem, not the inflected, forms of the vocables, and, therefore, that I did not count *man, man's, men, men's*, as four, *love, lovest, loves, loved, lovedest, loving*, as six, or even varying forms, as *amid* and *amidst*, or *while, whilst*, as two.

My estimates were made upon actual count of the words in Todd's 'Verbal Index to Milton,' as corrected and enlarged by Cleveland, and Mrs. Cowden Clarke's 'Concordance to Shakspere.' I have preserved my original memoranda of the number of words under each letter in the former, and have recounted half of the alphabet, taken at random, with little or no discrepancy from the first enumeration. The total number of words that are *words*—not mere accidents of words—in this Index, excluding, of course,

proper names, is between 7,500 and 7,600. But Cleveland omitted, as he says, "the articles; most of the pronouns, such as *thee, whom, his*, etc.: all the conjunctions; many adverbs; most of the prepositions, and such adjective-pronouns as present no striking idea, as *all, both, each*, etc." What he means by this is, that he omitted the *repetitions* of such words, for of many of them he gives one or more exemplifications. I have made a careful estimate of the words so omitted, and find that it falls far short of five hundred, and hence I repeat my original statement, that there occur "in the poems of Milton not above eight thousand" words.

I have neither time nor eyesight to repeat my enumeration of the words in Mrs. Clarke's 'Concordance,' but it was made at the same time and on the same principles as my computation of Milton's vocabulary, and I have entire confidence in its accuracy. Prof. Holden finds in Mrs. Clarke's 'Concordance' 24,000 words, in Milton 17,000. To obtain this result, he must have counted not words, but *titles* of reference, and therefore, with him, *loud, louder, loudest* count three, *need* (verb), *needest, needs, needed, needing*, five, while in both cases I consider the varied forms as all making but one word. The absurdity of this method of computation will appear more glaring if we apply it to the comparison of different languages in point of copiousness, and, to be consistent, Prof Holden must maintain that a savage language, composed of only a few hundred of word-signs of ideas, but with thousands of inflexional forms for each verb and dozens of cases for each noun, is richer than the most copious literary tongue existing.

GEORGE P. MARSH.

ROME, March 23, 1875.

## "SECOND STAGE OF WISCONSIN RAILROAD LEGISLATION."

TO THE EDITOR OF THE NATION:

SIR: In your issue of March 18, I find misrepresentations of so gross a character, concerning the recent railroad legislation in this State, as to demand correction.

It was doubtless the intention of your correspondent, "F. R. L.," to make a true showing of the character of the Wisconsin Legislature and the temper of our people, as well as truthfully to report the acts and opinions of the Railroad Commissioners. Unfortunately, however, he has done neither of these things. The inference is, that he wrote of legislative matters without full information. For, had he carefully and impartially watched the transportation controversy from the beginning, he would have reached different conclusions. He would have known, and so assured the *Nation*, that the people of Wisconsin mean no injustice to the railroad corporations; that the "Potter Law" was not the fruit of a deliberate purpose on the part of the public to prescribe arbitrary rates of transportation, without knowledge of whether those rates were just, but rather the unexpected result of a scramble between parties for the "Granger" vote, as a means to future political ascendancy; and that a legislature whose members were nominated while yet the corporations were refusing obedience to the law, and elected, many of them, under public pledges on that account to preserve that law intact, was not the body to fairly represent the public sentiment after the acquiescence of the corporations in the decision of the Supreme Court had softened the temper of the people, and favorably disposed them towards a judicious revision of the statute.

Of your correspondent's misrepresentations of the Commissioners explanation is not so easy. These are his words:

> "The Commissioners stated, not only in the Assembly but before the committees, and privately, that their bill was by them intended as a step towards the inauguration of a system under which the earnings of all capital should be regulated by legislation."

This statement is absolutely and utterly false. The Commissioners not only did not so state, either "in the Assembly, before the committees," or "privately," but even the thought of such a system as is here alluded to has never so much as entered into their minds.

If the reliance of the *Nation* is upon such correspondence, its sweeping editorial assaults upon the integrity of a great people are explained without difficulty. Their *justification* is hardly possible.

Respectfully,

JOHN W. HOYT.

MADISON, WIS., April, 1875.

[What we have said with regard to the "integrity of a great people," or rather with regard to the safety of investments in Wisconsin, has not been based upon the statement quoted above, but on the general tendency of Wisconsin legislation, as we have seen it exhibited in public acts and declarations for a considerable space of time. As to what the Commissioners said, or did not say, we must decline to be held responsible for the charge brought by our correspondent.—ED. NATION.]

# Notes.

POTT, YOUNG & CO. have in press 'A Christian Painter of the Nineteenth Century,' being the life of Hippolyte Flandrin, by the author of the 'Life of Bossuet' lately reviewed by our Paris correspondent.——'Madame Récamier and her Friends' and 'The Defence of Guenevere, and Other Poems,' by William Morris, will be published in May by Roberts Bros., Boston.——G. P. Putnam's Sons will reprint here an English work entitled 'The Keys of the Creeds,' which is described as an attempt to apply to the world's creeds the physical theory of natural development.——It is too late for competitors from this side of the water, but we note the fact that on May 1 a prize of fifty pounds is to be awarded in London for the "best essay showing the expediency of an address by the House of Commons to the Queen, in favor of such a rubrical revision of the services of the State Church as will abrogate the threat of everlasting perdition to those of her Majesty's subjects who do not agree with the doctrines contained in the Athanasian Creed."——The *Athenæum* states that Dr. Burton, the historian of Scotland, is engaged upon a 'History of Great Britain during the Reign of Queen Anne,' which will fill two volumes.——A life of the late General Nino Bixio, by Giuseppe Guerzoni, has appeared in Florence.——We learn that Miss E. P. Peabody's *Kindergarten Messenger* is in need of a wider support to ensure its continuance much longer. It is a useful little periodical, and we should regret to see it stop, especially since the editor seeks no profit beyond the expenses of publication. The triple number for the first three months of the year contains many valuable suggestions for mothers as well as for professional teachers in the Kindergarten. The subscription price is one dollar. Miss Peabody's address is 19 Follen Street, Cambridge, Mass. We may as well mention here a 'Hand-book of Fröbel's Method,' based on his writings and those of Baroness Bertha von Marenholtz-Bülow, by Hermann Goldammer, of which a third edition has just appeared (Berlin: Carl Habel) in two volumes, with numerous illustrations.——Mr. John T. Wood will deliver two lectures on Ephesus at the Cooper Union this evening and Saturday evening (April 22, 24) at eight o'clock.

—A correspondent writes us from Boston as follows: Mr. Green, in his 'Short History of the English People,' p. 493, makes a curious mistake. He says: "The words of a well-known minister show how hard it was even for the sternest enthusiasts to tear themselves from their native land. 'I shall call that my country,' said John Winthrop, in answer to feelings of this sort, 'where I may most glorify God and enjoy the presence of my dearest friends.'" The extract here given from the 'Life and Letters of John Winthrop' forms a part of perhaps the most charming letter in the whole collection. It is found, p. 276, Vol. I., in the letter of John Winthrop, jr., to his father, in which he announces his return to England from the Continent after an absence of more than a year. Neither the father nor the son was a minister, and the language which Mr. Green's English readers might think the didactic expression of a Nonconformist preacher, simply indicates the fervid and lofty spirit of the Puritan gentry who founded the colony of Massachusetts Bay.

—Although Hebrew ceased to be a living language about two thousand years ago, Hebrew literature did not come to an end with the Old Testament. On the contrary, there grew up amongst the Jews—"the people of the book," as the Koran styles them—an immensely rich post-biblical literature; and even at the present time many Hebrew books are still written and published, particularly in Eastern Europe. In America, thus far, only one Hebrew work has been produced, viz., 'Abney Yehoshu'a' (a commentary on a tractate of the Mishnah, called *Aboth*), by Joshua Falk, which was printed in this city in 1860. It is possible that some other Hebrew authors may have come over to this country; but, if so, we believe none of them found enough stimulus in the American atmosphere to continue his literary labors. We can at this moment call to mind only one Hebrew author of note who immigrated to the United States, namely, P. M. Heilprin (misspelled Heilpern in Fürst's 'Bibliotheca Judaica' and the catalogues of Zedner and Roest), who died January 30, 1863, in Washington City. Two works from his pen, of considerable interest ('Teshuboth Beanshey Aven' and 'Eben Bo'han'), were published in Frankfort-on-the-Main in 1845 and 1846 respectively. During the past two hundred years much has been done towards founding and furthering the science of Hebrew

Bibliography. We mention first, as amongst the fathers of this branch of learning, two Christian scholars, Bartolocci and Wolf. Of Jews who labored with great success in this field, Shabthai Bass, Azulai, Zunz, Steinschneider, Fürst, and Zedner deserve especial acknowledgment and praise. With these eminent Hebrew bibliographers must be classed Mr. M. Roest, the compiler of the 'Catalog der Hebraica und Judaica aus der L. Rosenthalschen Bibliothek' (Amsterdam, 1875). For a copy of this valuable work we are indebted to the present owner (son of the late owner and founder) of the great Rosenthal library, Mr. George Rosenthal, the banker, by whose directions it has been prepared. The catalogue, a highly interesting supplement to which is in fluent Hebrew, from the pen of the collector himself, is very attractively printed, in two bulky volumes. The bibliographical information which it imparts is rich, and can be relied on as correct and trustworthy. Indeed, we had no right to expect any but a perfectly trustworthy work from the hands of such a thorough and conscientious cataloguer as Mr. Roest was known to be. Previous literary productions of a similar nature had won for him an excellent reputation as a profound connoisseur of Hebrew literature. We have had time thus far to examine the catalogue but cursorily, but this has been sufficient to convince us that the errors of Mr. Roest's predecessors have here been silently corrected. Thus, for instance, Zedner, in his 'Catalogue of the Hebrew Books' in the British Museum, ascribed the 'Yalkut' erroneously to Simon Kara, and identified Aaron the Levite, the author of the book ''Hinnukh,' who lived in Barcelona, with the similarly-named author of 'Bedek Habbayith,' who was a Provençal. A glance at the present catalogue shows that its compiler, although he diligently compares Zedner and Steinschneider, was not a mere copyist, but that he worked independently by personal investigation of the original sources. We cannot conclude our notice without repeating the hope which we expressed some months ago (*Nation*, No. 486, Vol. XIX.), that some institution or congregation may be found in America which will acquire the Rosenthal library, and thereby give a new stimulus to the study of Hebrew literature, which is too much neglected on this side of the Atlantic.

—Maurice Block, the distinguished French statistician and economist, recently read a paper before the French Academy of Moral and Political Sciences on some of the results of the last United States census. It has since been published in the *Journal des Economistes*, and contains a great deal which, coming from such a source, is of the highest interest. He discusses the cause of American prosperity during the first fifty years of the national existence, and ascribes it in part of course to the great national resources of the country; in part to the national enterprise and ingenuity of the people; but more than all to immigration and steam. But he draws attention to the fact that the ratio of increase of population, which remained the same from the first census down to 1860, has been shown by that of 1870 to have declined. And he concludes that there is a similar slackening of the rate of progress in everything else. He connects with it, as an accompaniment if not a cause, a general falling-off of morals, revealed in the relaxation of the ties of family and the neglect of the education of the young, in the broad sense of the term, as distinguished from the communication of knowledge by means of books; and to this latter defect he ascribes "the greater number of American vices—the brutality, the violence, the cruelty, the drunkenness, the frauds, the want of honor." He speaks in severe terms of the corruption of American politicians, of the distaste of the women for the ordinary duties of home life; makes a comparison between the agricultural life of the earlier days of the Republic and the manufacturing life of the present day, greatly to the disadvantage of the latter; and concludes that if our decline is not to become steady, and we are again to resume our upward progress, we must reform our system of education, and prepare our children for the world by better methods and under better influences. The paper contains little that has not been said over and over again by economists and moralists in this country, but it deserves attention as the work of a foreign observer of no common powers and of great coolness of judgment. It has, however, the patent defect of treating the ten years between 1860 and 1870 as a normal period, of making little or no allowance for the influence of the war on manners as well as on industry, and of taking no notice of the efforts made to combat the evils which he points out, because these efforts, even when unsuccessful, are among the signs of recuperative force.

—Of much greater interest than the miracle at Salette, of which we lately gave some account in the *Nation*, and far more remarkable in their character, were the apparitions of the Virgin in Alsace-Lorraine in 1872–1873, seen, or supposed to be seen, by thousands belonging to all grades of society. These have been described, by one who was on the spot, in *Im Neuen Reich* for last year (Nos. 14, 15, 18, 19, 21). The worship of the Virgin, which had always existed in these provinces, assumed during the present century enormous proportions. In the diocese of Strassburg, for instance, there are sixty-nine places of pilgrimage consecrated to the Virgin, thirty-four in Lower and thirty-five in Upper Alsace. The disasters of 1870–71 were, it is well known, followed quite naturally in France by what we should call in this country a great religious awakening. Crowds of pilgrims flocked to Salette, Lourdes, and Paray-le-Monial, and the reports of new wonders and apparitions spread through the neighboring countries. The religious excitement in France was to a considerable extent political, and this was the tendency it early assumed in Alsace. Pamphlets containing prophetic voices concerning the future of the church in France and elsewhere were industriously circulated. Even the children were not free from the feverish excitement which had seized their elders; in the schools, in church, and at home, they heard constantly of oppression and persecution and of appearances of the Virgin. Sunday evening, the 7th of July, 1872, four little girls, between seven and eleven years old, went to pick berries in the woods near Gereuth, and as they went they talked of the persecutions to which Christians might yet be exposed, and expressed their determination to die sooner than renounce their belief; and while they wandered about, they repeated the *Memorare*. Suddenly one of the children stooped down, and saw a lady in white, wearing a yellow crown on which was a cross. There was also a black cross on her breast. The girl who first saw the apparition pointed it out to her companion, and then ran home in fright. The others saw the lady in white swing a sword or staff over the heads of soldiers who hovered beneath her, and then they too ran home. Such is the official account of the matter.

—The apparitions continued during the summer and autumn of 1872, and were witnessed by thousands, it being estimated that about fifteen thousand were present at Gereuth on the Christmas holidays. One of the most interesting things in the history of this hallucination is the means employed by the civil authority to control and suppress it. It was not deemed necessary or advisable to interfere at all at first; only the police forbade the remaining together at night of young people of both sexes in the woods where the apparitions were seen, and the burning of lights, which were likely to cause damage to the property of the state. As the political character of the demonstrations grew stronger, the forest police forbade entrance into the woods under penalty of a fine of twenty thalers, and a company of soldiers was sent to enforce obedience to this order. The Virgin, however, kindly left the forbidden territory and appeared in a field belonging to private owners, where she performed many miraculous cures. The Government was soon called on to adopt severer measures, it being apparent that advantage was taken of the opportunity to disseminate treasonable political opinions. Quite early in the history of the affair, the Virgin had been seen to hurl a sword towards the Rhine; combats took place in the air between the French and Prussians, with victory for the former; massacres of priests and members of religious orders were witnessed; and finally the Virgin was seen standing before a closed church-door guarded by a Prussian. In February and March, 1873, attention was called by a proclamation to certain articles of the Code Pénal which forbade religious meetings except in places consecrated to that purpose, unless permission had previously been obtained from the authorities. These repressive measures, which the military caused to be duly observed, had the effect of putting an end to the appearances in Gereuth, but they broke out in various neighboring towns. In Issenheim, for instance, hundreds flocked to a hut where the shadow of the outstretched arm of an image of the Virgin was seen to move on the wall by the light of flickering lamps. The crowd sensibly diminished when the authorities had the image placed on the outer wall in broad daylight. By the end of May the manifestations gradually disappeared. Although some instances of fraud were detected, it is undoubtedly true that most of the witnesses were sincere in their belief that they had really seen the Virgin.

—Dr. Friedrich von Bezold, author of 'König Sigmund und die Reichskriege gegen die Husiten,' has recently published a thin book (114 pages), a study 'zur Geschichte des Husitentums.' It is a very complete and perspicuous discussion of the relation of the Hussite revolution to the history of civilization of the time, eminently calm and impartial, and based upon the study of new and important materials. The effect of these civil wars he depicts as deplorable in the extreme, putting back civilization like the Thirty Years' War or the War of the Roses, and resulting in ecclesiastical despotism and feudal tyranny. At the same time, he vindicates the character of the movement from many of the standing accusations. His view is that, while the sentiment of nationality had much to do with it—in resisting the Germanizing process which had extirpated Slavism in Lusatia,

Silesia, etc.—yet this was not its principal characteristic, as Höfler and others would make out. It was primarily a religious movement, an outgrowth of the religious controversies of the fourteenth century, and a protest against the corruptions and the doctrines of the church. The national and the remarkable social characteristics of the movement—which one might think peculiar to the nineteenth century, so levelling are they—are, however, described, as well as its religious aspect, and form a very instructive portion of the work. At the same time, it is shown that the Taborites were far from being such fanatic barbarians as they are generally depicted; their leaders were men of learning and culture, well versed in controversial theology. Dr. Bezold shows, too, that the horrors attributed to them have been exaggerated, and that, at any rate, they were not the aggressors; the atrocities were begun by their opponents, and only taken up by them in the way of retaliation.

—The trial of Count von Arnim, aside from its political bearings, will long retain its interest as a judicial *cause célèbre;* and the exceptional position of the chief counsel for the defence, the eminent Professor von Holtzendorff, well justifies the republication of his speech, with a preface and notes, which he has undertaken (Berlin: C. Pfeiffer'sche Buchhandlung). The court, in its decision, substantially adopted the views of the defence, Von Arnim being fully exonerated from the grave charges of the Public Prosecutor, and found guilty of a light misdemeanor only. Indeed, the unusual rigor of the preliminary proceedings against the accused was effectually shown by the defence to have rested on but a slender legal basis. Professor von Holtzendorff divided the diplomatic papers, the retention or absence of which formed the object of the accusation against Von Arnim, into removed (*translocirte*), retained, and missing papers. Concerning the first class, specified as the Roman correspondence, Von Arnim may have had sincere doubts as to the propriety of depositing them in the archives of the German Embassy at Paris, especially at a time when he was himself being transferred to Constantinople. These papers were returned by Count von Arnim on application. The second class consisted of letters relating to the personal quarrels between Bismarck and Arnim, and the right of retaining them was claimed to the last by the Count, who produced them in court under protest. The missing papers turned up partly in Paris and partly in Berlin, but by far the greater part could not be found, and it was never ascertained when, where, and how they had disappeared. Thus, while the Roman correspondence, the most important of all, was readily delivered up by Von Arnim, the missing papers were of a comparatively indifferent character, so that the assumption of an intent on the part of Count von Arnim to publish the papers to the prejudice of Prince Bismarck could not be seriously entertained. The Public Prosecutor made no distinction between the papers, but nevertheless made them the ground of several distinct charges. Professor von Holtzendorff showed that the prosecution simultaneously regarded the same papers as public documents of the highest importance, and as objects of no intrinsic value in themselves, thereby making one and the same offence punishable under two different statutes of the law. Von Holtzendorff furthermore contested the legality of considering diplomatic correspondence in the light of public records (*Urkunden*), the very nature of such correspondence often shunning publicity. The definition of the term *Urkunde* he pronounced one of the most difficult in the whole range of jurisprudence, drawing a sharp line between historical and judicial records. Count von Arnim, he argued, may have been careless in the manner of guarding his diplomatic papers, but even this does not establish the fact of a disciplinary offence, inasmuch as the routine of the diplomatic service of Germany is not regulated by any fixed principles. There is no system of registering diplomatic correspondence to which Von Arnim was bound to conform, and even the traditions of the Prussian school of diplomacy in which he had been brought up afforded him no precedent for his position as German Ambassador. Archives were originally simply the repositories of secret documents, the manner of secreting them being left to the discretion of the ambassador. When secresy is the chief object to be attained, an ambassador may even burn the documents which he otherwise would not consider safe. The right of the German Empire as such to the papers retained by Von Arnim can by no means be established. Diplomatic communications from the Minister of Foreign Affairs to an ambassador are often couched in the form of a private letter; and the vagueness of the terms "official" and "unofficial" in this relation is manifest from the fact that a third form, "semi-official," is frequently used to denote certain diplomatic emanations. The accused had never denied the possession of the papers characterized as removed and retained, and the disappearance of the papers of the third class may be accounted for by a lack of method in Count von Arnim without resorting to a worse construction. Lastly, the irritating character of Bismarck's letters sufficiently explained the unwillingness of Count von Arnim to part with them; while great domestic afflictions which occurred at the same time would go far to excuse his negligence in carefully collecting all his papers on his departure from Paris.

—The *Russische Revue* for December has an important article by the famous Persian scholar, Fr. Spiegel, on the gain accruing to geography and ethnology from the decipherment of the old Persian cuneiform inscriptions. The Imperial Geographical Society of Russia published in 1856 Volume I. of a translation with additions of Ritter's 'Geography of Asia.' For Volume VI., on Iran—the last issue having been a part of Volume V., published in 1873—Dr. Spiegel's assistance had been invoked, and his contributions have been already published in the Russian translation of them. Dr. Spiegel's essays in the original German were afterwards handed to the editor of the *Russische Revue* for publication in his journal. One part has the above title, and the remainder, discussing "Iran philology and its importance with regard to the language and the descent of the Iranians," was to appear in a subsequent number of the *Revue*. In the part published, Dr. Spiegel gives an outline of the history of the deciphering since 1838, the date of the original publication of Ritter's work, and then comments upon the geographical limits of the districts mentioned in the three inscriptions of Behistûn, Persepolis, and Naqs-i-Rustam.

—In the same number Dr. Emil Schmidt points out a few errors in the general map of Central Asia, published in 1874 by the Royal Military Geographical Institute of Vienna; and W. Köppen describes at some length excursions which he made last year in the Baidar Valley in the Crimea. A large part of Köppen's article treats of the megalithic monuments of the Crimea: only a few menhirs, or upright stones like those of the western part of Europe, occur here, but dolmens resembling those found in Brittany are very common. The author, without professing to be an expert in the matter, is inclined to agree with Desor and Bonstetten that the dolmens, on account of their singularity, the difficulty of constructing them, and their general resemblance, must be ascribed to one and the same people; but unlike Bonstetten, whom he interprets as holding that the dolmen-builders continually emigrated from one country to another without leaving remnants behind, he believes that their blood, though by no means unmixed, still flows in the veins of the present inhabitants of the dolmen regions. The author gives as a reason for disagreeing with Bonstetten's view of the course which the dolmen-building emigrants took, that the dolmens of the Crimea and the Caucasus are of a superior character to those of North Germany, which Bonstetten supposes to have been occupied subsequently. Herr Köppen thinks that there are not facts enough to determine the course actually taken by these emigrants, which is probably a sounder observation than his objection to Bonstetten, because there may have been an emigration, and according to Bonstetten's route. Yet the use of the dolmens may, according to Köppen himself, have continued longer in some places than elsewhere, or they may have been adopted by the conquerors or the successors of original dolmenites.——Another article in the eleventh, or November, number of the *Revue* deserves mention, the address at the institution of the Society of Friends of Caucasian Archæology, by Ad. Bergé, the vice-president of the society.

## McCOSH ON TYNDALL.*

AMONG the natural consequences of the sin committed by Professor Tyndall in the hardihood of his late Belfast address, is the revival by it of the inextinguishable flame of metaphysical controversy. That the address was not fit, in the nature of things—to say nothing of the conventions, the common or unwritten laws of scientific societies, which the author violated—appears by the consequence that the most fitting reply to it comes from Dr. McCosh. Such popular organizations as the British Association for the Advancement of Science were copied from the aims and disciplines of the *élite* among modern scientific societies. These societies are, in a word, schools of Baconism, designed to embody all that was of value in the thought and spirit of Bacon—namely, a protest against traditional authority in science, with, of course, a recommendation of induction and of the inductive sciences for their value in the arts of life. As to method in induction, Bacon's teaching was of comparatively little value. His really distinguishing service was in accomplishing a more or less complete and enduring severance, at least in British thought, of physical science from

* 'Ideas in Nature overlooked by Dr. Tyndall: being an Examination of Dr. Tyndall's Belfast Address. By James McCosh, D.D., LL.D.' New York: Robert Carter & Brothers. 1875.

'The Scottish Philosophy, Biographical, Expository, Critical, from Hutcheson to Hamilton. By James McCosh, LL.D., D.D.' New York: Robert Carter & Brothers. 1875.

scholastic philosophy, and from all traditions of more ancient thought. One of the most interesting consequences of this movement is that the word "philosophy," and even the name "natural philosophy," have distinctly different meanings in English and in the Continental languages. The body of ancient traditional thought was so completely routed that its name, Philosophy, lost its meaning, and became appropriated to the knowledge and pursuits which in ancient times divine philosophy disdained. Socrates, it is said, brought down philosophy from the clouds; and Continental thinkers have reproached the English for having degraded her to the kitchen. This recognition of the dignity of the useful and of the authority of induction, but still more the subtler perceptions of method in induction by later English thinkers, and especially in the Positivism of Locke, Newton, Herschel, and J. S. Mill, have more than anything else given the English their eminence in modern science. The restraints of the speculative spirit in scientific pursuits, determined mainly by a desire for peace with Theology and Philosophy, and accomplished by a division of provinces, have been the chief cause of the easy triumphs of inductive evidences in the modern sciences of physics, astronomy, chemistry, and even geology and biology, over an opposition which, when roused, has carried with it the strength of a desperate self-defence and all the gigantic forces of tradition. The best British thinkers, therefore, from Newton to Darwin, have respected this peace; and Dr. Tyndall has put himself out of this category by the performance that relegates him to the tender mercies of Dr. McCosh.

As spectators of the combat, we may, however, forget the rash occasion which brought our scientific hero into this arena, and extend a sympathy to him in this relation which we withheld from him as the retiring president of the British Association. In the prefaces to his published address, Tyndall charges some of his critics with "a spirit of bitterness which desires, with a fervor inexpressible in words, my eternal ill." Dr. McCosh "happens to know of some of them, that they are praying for him, in all humility and tenderness, that he and all others who have come under his influence may be kept from all evil, temporal and eternal." Such belligerent magnanimity must be very consoling to its object. To be prayed for particularly by fellow-mortals that we may be delivered from deliberately cherished, or at least seriously considered, views on the nature of things, and not alone for what we ourselves recognize as evils, may be from a sympathy with a supposed unconscious, undeveloped better-self in us; but to us, our conscious selves, it seems scarcely different, except in degree, from a sympathy and a wish for our eternal welfare which would burn us at the stake. Indeed, the attitude is not very unlike that of picking up the fagots for a spiritual cremation, of which the material symbol is now forbidden by civilized opinion and law. To use the language of kindliness and magnanimity when every page manifests an intense, though smothered, *odium theologicum*, conceals nothing, and repels more effectively than the most open hostility. Expressions of petty spite, depreciatory epithets, intimations of ill-opinion, readiness to credit evil reports of those who hold unorthodox opinions in philosophy, and misinterpretations of every sign of weakness in them—these characterize Dr. McCosh's treatment of those thinkers, included in his lately published biographies of Scottish philosophers, who differ from him in fundamental views. If his object—supposing him to have an object in this—were simply to frighten the faithful from any contact with the unholy, we can see how he might effectively keep them faithful through ignorance; but if he thinks in this way to win any one to his standard, we think he greatly mistakes the nature of the sceptic. He calls attention in his preface to the fact "that in this paper, under none of its forms, have I charged Professor Tyndall with being an atheist"; and near the close of his paper he announces that "I make no enquiry into the personal beliefs of Dr. Tyndall," though in the preface he had professed to believe that Tyndall's feelings are not fixedly bad: "At present very wavering and uncertain—*feelings*, rather than convictions founded on evidence." Dr. McCosh here makes use of the "extenuating method," the *eironeia* of Aristotle's rhetoric, though with ineffective art. His restraint from this fearful accusation is made up for by a zeal going greatly beyond due accuracy of thought and exposition, in his preparation of the case for whosoever may thereby be stimulated to prefer the charge.

We have space only for the examination of one great confusion of thought which runs through not only this paper but much of the criticism in his biographical work on the 'Scottish Philosophy,' wherever he treats of the opinions of the "sceptics" of his native land.

Lord Bacon is Dr. McCosh's model in philosophizing, and, however marked may be the differences, there is a striking similarity between their minds. The great point of sympathy is in Bacon's demonstrative, aggressive, and rather effusive professions of theism. This wins for Bacon the enthusiasm of such a disciple for "the comprehensiveness of his mighty mind"; and is likewise the measure with Dr. McCosh of the minds which he treats favorably in his biographies. Now, Bacon in his model enquiry which occupies so large a space in the 'Novum Organum,' the enquiry into the form of heat, reaches the conclusion that heat is a kind of motion; meaning, of course, not the feeling of heat, but the conditions of the feeling. Dr. McCosh would be the last to charge Bacon with atheism for this verbal ellipsis. Nor do we suppose that he would be alarmed by the confusing ambiguities of the words light, sound, taste, touch, and the like, which are used by all modern philosophers to express two totally dissimilar natures, the tremors of ether and air, with the chemical and mechanical properties of bodies in contact with special organs of sense, and the sensations of light, sound, etc., of which these homonymical words are also the names; a part of a cause and its effect having the same names though wholly different in nature. Nor again do we suppose that he would take alarm at the inclusion, in such names, of the other physical conditions of a conscious product or sensation—namely, the movements or changes in living nervous tissues, which are the more immediate conditions of the production of a sensation. Mr. J. S. Mill, however, in his 'Logic,' takes to task a philosopher of his own school for defining an idea or notion as "a contraction, motion, or configuration of the fibres which constitute the immediate organ of sense." "Our *notions*," Mill exclaims, "a configuration of fibres! What kind of philosopher must he be who thinks that a phenomenon is *defined* to *be* the conditions on which he supposes it to depend?" What sort of philosopher must this one be, we may add, who not only makes this confusion in his imputations of opinion to scientific philosophers, ancient and modern, but intimates that the gravest defects not only of mind but of character are implied by it? The poverty of philosophical language, rather than such fatuity, would have been the more charitable account of what is charged as materialism against these thinkers. No philosopher of note among them, we are sure, ever seriously thought that atoms by their collocations and movements *explain* (in the sense of unfolding the essential natures of) "sensation, judgment, reason; of love, passion, resolution." None ever attempted, as Dr. McCosh intimates that Tyndall has done, to "account in this way for the affection of a mother for her son, of a patriot for his country, of a Christian for his Saviour." No one ever supposed that, "aggregate them [the atoms] as you choose, and let them dance as they will," there is "any power in them to generate [in the sense of producing their like] the fancies of Shakspere—his Hamlet, his Lady Macbeth, his King Lear—the sublimities of Milton, the penetration of Newton, or the moral grandeur of the death of Socrates." Yet Dr. McCosh calls Tyndall to account for so doing in these grave terms: "What—to employ the very mildest form of rebuke—can be the use of devising hypotheses which have not even the semblance of explaining the phenomena? In the interest of science, not to speak of religion, it is of moment at this present time to lay an arrest on such rash speculations; and to insist on scientific men refraining from what Bacon denounces as 'anticipations of nature,' and confining themselves to facts and the co-ordination of facts."

Dr. McCosh is not quite accurate here about what his model Bacon recommends. The past errors which Bacon opposed he called "the Anticipations of Nature" by the mind, and in place of this recommended "the Interpretation of Nature," or "that which is properly deduced from things," and (it is to be presumed) may include somewhat more than a bare co-ordination of facts. But whatever Bacon meant to "denounce," it is certain that the physical sciences which have grown up since his time involved in their establishment a great deal more of "the picturing power of the mind," which Tyndall justly esteems, than Dr. McCosh is inclined to allow. But this is a comparatively trivial error. The gravamen of his charge is wholly mistaken. Tyndall publishes as an appendix to his address a lecture previously delivered, in which the doctrine thus imputed to him is disavowed. Dr. McCosh refers to this fact, but regards it as either trivial or as inconsistent with the ominous meaning of that discovery in matter of "the promise and potency of every quality of life" for the "confession" of which Tyndall "abandons all disguise." In spite of this lecture Dr. McCosh thinks that Tyndall "feels himself entitled to hold that matter, though we cannot say how, may give us all the operations of understanding and will." It is important to understand here in what sense "may give us" is to be taken. Certainly Tyndall is no disciple of Lucretius, or of the great and subtle Greek physicists, if he holds that atoms, the primordia, the elements, the seeds, or first-beginnings of things have the natures of understanding and will. That these are not the properties, but only the accidents (in the logical sense), of the movements and collocations of the elements, is the Lucretian doctrine. Moreover, "primordial elements" does not refer to remoteness in time past, but to simplicity and unchangeableness in present, past, future, or the infinitely enduring causes of change.

In other words, what these philosophers sought to explain by their theory of atoms is not the natures of the passing phenomena of sense, understanding, and will, but their occurrences, and the order (such as there is) in their occurrences as actualities or events. Such phenomena were not regarded as consisting of the properties of atoms, of size, weight, movement; but only as depending for their actual manifestation on certain elemental collocations and movements. Modern physiology is in striking accordance with these vague speculations. It does not, neither did they, affirm that the properties of matter (that is, the permanent and universal natures of matter) define or determine anything except the events of phenomena. Neither were the gods excluded by these speculations from existence, or from the moral interests and regards of men, in accordance with their reputed characters. They were only excluded from the arbitrary determination of the course of events, or from any other interference than that of being in their consciousness and actions a part of this course. They, too, were dependent in their thoughts and volitions on material conditions. Whatever loss of dignity or wound to pride in men might come from such subjection to material conditions was shared, according to this philosophy, by the gods. That the conditions of the nervous tissues which we vaguely describe as health, wakefulness, and vigor are a sum of material conditions, which occurring along with other material conditions around them determine particular perceptions, thoughts, and volitions as mental events, is a modern form of the same doctrine. This does not involve, however, the kind of explanation that Dr. McCosh appears to suppose.

There are two meanings of the word "explanation," or, rather, two kinds of explanation involved in philosophy, the confounding of which, not by Dr. McCosh alone, but by nearly all the hostile critics of ancient and modern physical philosophy, has led to great confusion and injustice. To know the conditions of the occurrence of anything in such sort that we may predict this occurrence, whenever and wherever these conditions are given, though as phenomena these conditions may be in their natures wholly unlike the effects of them, is one mode of explanation. To presume this mode to be applicable to relations of any nature in which the conditions and phenomena are too complicated to be fully known or used for prediction, is the speculative employment of this mode. To be able to analyze or decompose a phenomenon or effect into its constituents is another mode; whether or not we are able by combining the two modes, as in the dynamical sciences, to explain an effect as the sum of the several effects of the constituents of its cause. This most perfect kind of explanation, this combination, is reached only in dynamical science, and was never pretended to by the clear-headed Greeks who speculated so widely on the nature of things. That mental events and their combinations are fully conditioned, as events, on material ones is all that they ever pretended to believe; and in this opinion most modern physiologists agree with them. These philosophers have fared hard at the hands of the aggressive theists, their expounders and critics. Thus Bacon, as quoted by Dr. McCosh, says: "Even that school which is most accused of atheism doth the most demonstrate religion, that is, the school of Leucippus and Democritus and Epicurus. For it is a thousand times more credible that four mutable elements and one immutable fifth essence, duly and eternally placed, need no God, than that an army of infinite small portions or seeds unplaced should have produced this order and beauty without a divine marshal." Bacon here implicitly attributes to the ancient physicists that conception of their opponent Anaxagoras, which may be said to be the foundation of the philosophical theism of all subsequent times. It is common to speak of Anaxagoras as having introduced into the philosophy of nature the *nous*, or the independent agency of intelligence. It is not so commonly seen that he introduced along with this, and in antithesis to it, a still more characteristic idea: that of a primeval chaos. The anti-chaotic *nous* of Anaxagoras is not that of the physicists and the pantheists. The only chaos contemplated by the ancient atomists is the one they saw around them always existing; one which had always existed in the indeterminate confused actual order, at any time, of the universe as a whole. Its particular orders were regarded as accidents; that is, not permanent or inherent properties of the elements. This last conception, by the way, has been grossly abused, accident being interpreted to mean an absolutely undetermined event; an Anaxagorean accident, such as might have happened in that primeval chaos, which the atomists did not believe in, when "all things were in a confused heap," and before "*nous* intervened to set them in order." That "things might all have been such that there was no fitness in them, and the most unfit might have survived," is the reason Dr. McCosh gives for "discovering an ordinance of intelligence and benevolence in the very circumstance that there is a fitness, and that the fit survive." So deeply imbedded in his intelligence is this conception, this essential idea of theism, the primeval chaos, that because he can conceive an altogether undemonstrable condition of things to have been possible, he postulates as actual a cause, or a mode of action in a cause, the *nous*, which would have defeated this possibility—a very common and almost unconscious kind of *a priori* argument. It thus appears that Dr. McCosh, not less than Professor Tyndall, "crosses the boundary of the experimental evidence," and "revels in hypotheses about world-making and world-ending." He "professes," indeed, to found his convictions in a Baconian way on "inductions," the name he gives (without adequately explaining the process) to what most other modern thinkers call and try to explain by the name "intuitions *a priori*." In this Dr. McCosh has doubtless confounded the effect of repeated assertions and professions of belief with the force in producing universal beliefs of invariably repeated particular experiences—an effect enforced by that modern factitious moral obligation, "the duty of belief"; a duty which though urged upon us by modern religious teachers with respect to certain ancient speculations, as of Anaxagoras, Socrates, and Plato, was far from being felt or admitted by these great teachers. Their service to us was in teaching *how* rather than *what* to think and believe.

A singular mistake for one who has undertaken to classify modern thinkers is committed by Dr. McCosh when he makes Comte the founder of the school to which Tyndall, Spencer, Huxley, Bain, and even Mr. Darwin are assigned. Two of these thinkers—Spencer and Huxley—have publicly disavowed and disproved any obligations to Comte. It would be cruel, if it were not absurd, to make Comte and Mill responsible, as Dr. McCosh does, even in the slightest degree, for the free use of hypotheses in science made by these thinkers, and especially the use made by the cosmologists among them, by Spencer and Tyndall, of hypotheses for "crossing the boundary of the experimental evidence." Comte all his life, and Mill until late in life, resisted even the undulatory theory of light, as involving the unverifiable hypothesis of a medium, though most physicists, even in Comte's lifetime, admitted the probability of the theory which is now universally adopted. It is strange to see the use of hypotheses in physical enquiries attributed to Mill's recommendation, as it is by Dr. McCosh. As well might one attribute the invention and recommendation of reasoning to Aristotle! Mill only systematized, in his 'Logic,' what physicists from Galileo had been constantly doing; and no one at all conversant with mathematical and experimental researches is ignorant of the fact that the use of hypotheses, as "recommended by Mill," is indispensable in that "interpretation of nature" which Bacon recommends. But these hypotheses are, for the most part, trial-questions—interrogations of nature, or are scaffoldings which must be taken down, as they are by the tests, the verifications of observation and experiment; and form no part of the finished structure of experimental philosophy. Comte and Mill, least of all among modern thinkers, recommended their use as bridges for "crossing the boundary of the experimental evidence," whether by the Lucretian road with Tyndall, or on the Anaxagorean highway with McCosh.

## THOMSON'S INDO-CHINA AND CHINA.*

THIS bulky volume may stand high, as works of travels go. The author is a vigorous Englishman, who explores, observes, and recounts with the energy that goes hand-in-hand with high animal spirits; he apparently knows his field very thoroughly, he has seen a vast number of curious places and things, and he has made an entertaining and readable work. He has been able to enrich it with a great many admirable wood-cuts, reproduced from his own photographs. These engravings are singularly careful and elaborate; we have not lately seen any of so fine a kind. They are all very clear, and some of the smaller ones are remarkable. Mr. Thomson was himself a photographer, and to discover interesting subjects appears to have been the principal aim of his wanderings. He carried his camera and lens into regions unconscious of the mystic process, and he relates a number of odd stories about the terror and hostility they generally provoked. The Chinese, even of the upper classes (who seem to combine in an ingenious manner most of the vices of civilization and of barbarism, and to possess few of the virtues of either state), consider that to be photographed is a certain forerunner of death, and Mr. Thomson had reason to congratulate himself on having arrived at Nanking just *after* the death of the great General Tseng-kuo-fan, rather than just before it. He had hoped to take a portrait of the eminent warrior—one of the chief agents in the suppression of the Taiping rebellion—and if the General's demise had occurred just after his sitting for his likeness Mr. Thomson might have been in an uncomfortable position. The most interesting portion of his work is the first half,

* 'The Straits of Malacca, Indo-China, and China; or, Ten Years' Travels, Adventures, and Residence Abroad. By J. Thomson, F.R.G.S.' New York: Harper & Bros. 1875.

treating of his observations in Siam and Cambodia. He travelled thence up the China Sea, visiting all the great cities and coast settlements—Hong-Kong, Canton, Amoy, Foochow, Shanghai, Nanking, and Peking, besides making various deflections into the interior, exploring the magnificent island of Formosa, and sailing, adventurously, over death-dealing rapids, some thirteen hundred miles up the great Yang-tse River, the stream at whose mouth Shanghai stands. Apropos of this part of his journey, we may quote, in illustration of Mr. Thomson's style, this rather striking passage :

"This rapid is one of the grandest spectacles in the whole panorama of the river. The water presents a smooth surface as it emerges from the pass ; then suddenly seems to bend like a polished cylinder of glass, falls eight or ten feet, and finally curves forward in a glorious crest of foam as it surges away in wild tumult down the gorge. At this season sundry rocks enhance the peril of shooting the rapids. On our way down we persuaded Chang to come into the boat with us, but as the vessel plunged and groaned in an agony of straining timbers, he became perfectly sick with panic-fear. It was indeed hardly to be wondered at. The pilot we employed at this time was a tall, bony man, with dark, piercing eyes, a huge black mustache, and a mouth full of foxy fangs. He and his assistant guided the boat into what seemed to be the worst part of the rapid, and then launched her into the raging waters, broadside on. After the first plunge she swept round bow foremost, tearing and writhing, until I thought she would go to pieces and disappear. Meanwhile, the pilot, flinging his arms on high, danced and yelled like a fiend about the deck, conveying the notion that the craft was doomed, although in reality he was only guiding his men at the helm. But the boat, regardless of oars and rudder, sped forward with a fearful impetus, bearing right down for the rocks, dodged them at the last moment, when the pilot had been seized with a fit of frantic despair, and then, with a groan of relief, darted into comparatively smooth water far below. The pilot's buffoonery is probably part of his game. It pays when he at last presents himself for his legitimate fee, and for the trifle extra which he expects for saving our lives at the risk of his own."

Mr. Thomson, in general, in the latter part of his narrative loses some of his animation, and also some of his clearness. He makes rather unexplained jumps and sudden transitions, and one does not always understand how he journeyed from one point to another. But he gives a vivid and entertaining picture of life and manners in the commercial stations of the Malay Peninsula and Indo-China—Malacca, Singapore, Saigon, Macao, and Hong-Kong—where, among hosts of perfidious Malays and counter-plotting Chinamen, the English, the Americans, the French, the Germans, and the Dutch are measuring their mercantile wits against each other, competing and outbidding, and contracting luxurious tropical habits and irritable tempers. Socially, Mr. Thomson considers the golden age of these picturesque communities to have passed away. Fortunes are less easily made, competition is fiercer, the Germans are ousting the English from the counting-houses, economy is more needful, and the click of the telegraph is an echo, in spite of the murmur of Southern seas, of the feverish uproar of the City and of Wall Street. In Siam Mr. Thomson made sundry interesting observations—though his statements are occasionally at variance with those of Mrs. Leonowens. He photographed the First King, and received various English letters from him. Here is a verbal photograph of one of his Majesty's functionaries—a magistrate at Bangkok : "There, in an open court, we found the fat judge, a single silken cloth round his loins—his only judicial robe—seated at a small window, with one flabby leg hanging over in the sunshine ; a slave-girl fanning him, his mouth filled with betel-nut, and thus snorting out his enquiries from time to time. The prisoners were shut up in a sort of cattle-pen in front, while their friends and supporters, laden with gifts of fruits, cakes, or other produce, crawled through the court in continuous procession, and presented their offerings for inspection as they passed the judge's chair." Mr. Thomson made an expedition across country to Cambodia, and visited the extraordinary ruins which mark the seat of empire of this ancient rival of Siam. On this subject he has a very interesting chapter, with some very delicate wood-cuts from his photographs. The overthrow of Cambodia by the Siamese took place in 1373, and the architectural monuments which still cover the ground belong, for the most part, to the period just anterior—the climax of her independence. Few extinct civilizations appear to have left more impressive relics. Mr. Thomson gives a detailed account of the great temple of Nakhon, "rising with all the power which magnitude of proportions can give ; a sculptured giant pyramid amid forests and jungle-clad plains," with its terraces, its towers, its galleries, its bas-reliefs, full of the most refined workmanship ; its complex Buddhic symbolism, revolving largely about the image of the seven-headed snake. "We spent several days," says the author, "at the ruined city of Nakhon, on the verge of the native jungle, and amidst a forest of magnificent trees. Here we were surrounded on every side by ruins as multitudinous as they were gigantic ; one building alone covered an area of vast extent, and was crowned with fifty-one stone towers. Each tower was sculptured to represent a four-faced Buddha or Brahma, and thus 204 colossal sphinx-like countenances gazed benignly toward the cardinal points, all full of that expression of purity and repose which Buddhists so love to portray, and all wearing diadems of the most chaste design above their unruffled stony brows." "The disappearance of this once splendid civilization," he also pertinently observes, "and the relapse of the people into a primitiveness bordering in some quarters on the condition of the lower animals, seems to prove that man is a retrogressive as well as a progressive being, and that he may probably relapse into the simple forms of organic life from which he is supposed by some to have originally sprung."

Mr. Thomson's most interesting adventure was his journey into the interior of the island of Formosa, which lies at a distance of a hundred miles off the southern Chinese coast. The Chinese occupy but one side of it, the other being thickly tenanted by aborigines of reputed cannibalistic tendencies. The late invasion of the island by the Japanese was based upon the fact that Japanese subjects wrecked upon the coast had been repeatedly plundered and massacred by these barbarous tribes. Mr. Thomson plunged energetically into the interior, in spite of many warnings of dangerous encounters, and found mountain scenery of extraordinary magnificence. The Pepohoans (semi-civilized aborigines) were extremely mild and friendly, though very miserable, both of which characteristics may perhaps be inferred from the incident of a crowd of them asking for a pull at the author's cigar and returning it carefully when it had been passed around. Mr. Thomson gives a large mass of information about China, the tea-trade, the silk-trade, the manufactories, the mines, the arsenals, based upon his observations both in the great cities and in localities at some distance from the coast. He gives us the impression that travelling in the Celestial Empire is as agreeable as the two great facts of the pauperism and the filth of the inhabitants allow it to be. It is interesting because of the density of the population and the amount of detail, as it were, in their manners and customs. Here is an example :

"We made another halt to visit a village fair, where we saw a poor conjuror perform tricks for a few cents that would make his fortune on the London stage ; and yet his greatest trick of all was transforming three copper cash into gold coin. His arms were quite bare, and, having taken his cash in the palm of his hand, he permitted me to close the fingers over them. Then passing the wand above the clenched fist, he opened it again, and feasted the greedy eyes of his rustic admirers on what looked extremely like glittering gold. He also killed a small boy whom he had with him by plunging a knife into his body. The youth became suddenly pale, seemed to expire, then, jumping up again, removed the knife with one hand while he solicited patronage with the other. There was one feat which this conjuror performed with wonderful dexterity. He placed a square cloth flat upon the ground, and taking it by the centre between his forefingers and thumb with one hand, he waved the wand with another, and, gradually raising the cloth, disclosed a huge vase, brimful of pure water, beneath it."

Mr. Thomson's pages remind one afresh of the extraordinary disparity between Chinese material industry and skill and Chinese moral civilization. He found excellent iron-clad steamers in course of manufacture by native labor, and the various arsenals—though these were under foreign supervision—in a state of high efficiency. The author's view of the future of China, in the absence of immense radical changes, is naturally not a hopeful one, and he eyes with suspicion these active efforts towards the multiplication of the *matériel* of war. They seem to him to point not only to views of self-defence from further foreign intrusion, but to a possible furious fanatical movement to extirpate the actual foreign settlements.

## THE NORTH AMERICAN REVIEW FOR APRIL.

MR. E. GRYZANOWSKI, who always writes well, discusses "Comtism" in the current number of the *North American* in a way which throws a good deal of light upon that system of so-called philosophy, and reminds us at the same time how rapidly it is fading in the distance. When Mr. J. S. Mill published his fascinating essay on Comte's life, and gave the English and American public their first real introduction to the philosopher of the "three stages," it seemed for the moment as if a new light which was going to change the face of the world had shone above the horizon. Here was at once an explanation creditable to human nature of the growing scepticism of the world, a formal exclusion of religion from the domain of science, and at the same time a revindication of the claims of religion upon the heart, and a joint apotheosis of human nature and morality. But empirically, the law of the "three stages" is not true, or has at least been denied by men of such divergent opinions as Mr. Herbert Spencer and the late Professor Whewell ; the religion of the "grand être humain" has been formally adopted by a little band of converts in England, without attracting anything more than good-humored amusement from the general public, and certainly without showing any tendency to spread itself

abroad; the extraordinary social system which Comte built up for himself proves to have been distinctly the result of that very metaphysical habit of mind which he so emphatically despised; and all the historical, sociological, and economical researches of the day show more and more clearly that the progress of mankind lies in directions away from that which he confidently pointed out. The "trilogy of man, humanity, and nature," the "anthropological data" of "the parent, the consort, and the child" (corresponding to the past, the present, and the future), and statically "the woman, the man, and the priest" (corresponding to the domestic, civic, and social life); the other trilogy of priesthood, patriciate, and proletariat, this representing and corresponding with the three faculties of individual man, viz., loving, thinking, and acting—what is all this but the sound and fury of metaphysical sociology? A state of society in which "separate professions must cease," and "the priest must be philosopher, physician, and artist," in which there are no rights (but at the same time there are duties), no parliaments, and no newspapers, is not a state of society which we can any longer conceive as possibly evolved from the condition of things now existing within any period of time worth considering. Mr. Mill, if we remember rightly, inclined to the belief that the later speculations of Comte, in which he formulated his religious and social theories, are separated by a wide gulf from his earlier lucubrations; but any one who reads Mr. Gryzanowski's résumé of his system will see that it all "hangs together" very well, and the fundamental assumptions on which Comte proceeds are not more simple and rational (though of course less amusing) than the proposed Positivistic rite of salutation—a phrenological gesture consisting "in touching the three cerebral regions containing the organs of benevolence, order, and activity."

Mr. C. F. Adams, jr., contributes an article on the Granger movement, which he says can now be looked on as "a phenomenon of the past," and which may therefore be "treated in a spirit of critical justice." The grievances of which the Grangers complained originated, according to Mr. Adams, in two causes—in the first place, "competition," and in the second place, "bad manners." By "competition" is meant that system of management which favors "competing points" at the expense of "non-competing" points. That is to say, the railroads, at points where several lines converge, fight vigorously for the business by lowering rates, while other points a few miles away are charged every dollar their business can be made to pay without driving it off the railroad and back into the highway. We are inclined to think, however, that if this means that local rates have been during a series of years increased because through rates were diminished, Mr. Adams is wrong. Of course, it is admitted to be a fundamental principle of railroad management that the cost of transportation depends on the amount of business done, and if we imagine the case of a non-competing point furnishing, let us say, a single car-load a month, it is evident that very high rates would have to be charged to make it worth while to do this business, and that in all probability the inhabitants of this point would be forced in the long run to go back to the highway. But we do not see any great hardship in that, or any reason why the Government should undertake the business. As to bad manners, Mr. Adams declares that "the manners of the employés of the Western railroad system are probably the worst and most offensive to be found in the railroad world." But what excuse this furnishes for the Granger movement we do not see, the manners of these employés being presumably the manners of the population from which they are taken. The Western railroad employé is not a foreigner, nor even an "absentee"; he is a son of the soil, who, being put in authority, asserts his equality with the Granger by violence and neglect of his duties, just as the Granger asserts his equality with the absentee owner by "fixing rates" at his expense. To Mr. Adams's article, however, we have no space to do justice. It contains a very clear exposure of some of the absurdities of the Granger movement from one who makes no secret of having at one time hoped much from it in the way of reform.

Mr. Lowell's article on Spenser will be read with interest. It contains some of his best criticism. The great glory of Spenser is, in Mr. Lowell's opinion, that "he taught his own language to sing and move to measures harmonious and noble." We cannot do better than quote a single passage which seems to us to express with remarkable success what everybody must have felt more or less dimly with regard to his versification:

"It was this instantly felt if not easily definable charm that forthwith won for Spenser his never disputed rank as the chief of English poets, and gave him a popularity which, during his life and in the following generation was, in its select quality, without a competitor. It may be thought that I lay too much stress on this single attribute of diction. But apart from its importance in his case as showing their way to the poets who were just then learning the accidence of their art, and leaving them a material to work in already mellowed to their hands, it should be remembered that it is subtle perfection of phrase and that happy coalescence of music and meaning, where each reinforces the other, that define a man as poet and make all ears converts and partisans. Spenser was an epicure in language. He loved 'seld-seen costly' words perhaps too well, and did not always distinguish between mere strangeness and that novelty which is so agreeable as to cheat us with some charm of seeming association. He had not the concentrated power which can sometimes pack infinite riches in the little room of a single epithet, for his genius is rather for dilatation than compression. But he was, with the exception of Milton and possibly Gray, the most learned of our poets. His familiarity with ancient and modern literature was easy and intimate, and as he perfected himself in his art, he caught the grand manner and high-bred ways of the society he frequented. Even to the last he did not quite shake off the blunt rusticity of phrase that was habitual with the generation that preceded him. In the fifth book of the 'Faery Queen,' where he is describing the passion of Britomart at the supposed infidelity of Arthegall, he descends to a Teniers-like realism,—he whose verses generally remind us of the dancing Hours of Guido, where we catch but a glimpse of the real earth, and that far away beneath. But his habitual style is that of gracious loftiness and refined luxury."

An account of the recent revolutions in Japan, by Mr. William E. Griffis, and one on Pauperism by Mr. Charles L. Brace (who gives the astonishing statistics with regard to the diminution of pauperism in Elberfeld by the system of house-to-house visitation and inspection), together with the usual book-notices, make up the rest of the number.

*Quinti Horati Flacci Opera.* The Works of Horace, with English Notes and Introduction. By J. M. Marshall, M.A., Under Master of Dulwich College, late Fellow and Lecturer of Brasenose College, Oxford. Vol. I.: The Odes, Carmen Seculare [*sic*], and Epodes. (London: Rivingtons. 1874.)—The text of this neat edition, which belongs to the Catena Classicorum, is taken from Orelli's third, posthumous edition. In cases where the editor could not agree with Orelli, he has availed himself of the *apparatus criticus* of Keller and Holder, and discussed the readings in the commentary. It will interest the friends of Professor Bryce in this country to know that the editor acknowledges his obligations to this scholar (as well as to Mr. E. S. Morgan of Dulwich College) for assistance and for many valuable suggestions. The notes, which are on the page with the text, are short and to the point, and the translations tasteful. An introduction treats of the life, character, and works of Horace. The usual account is given of Horace's personal appearance: "Short of stature, inclining to stoutness; with dark eyes and dark hair, prematurely tinged with gray. His eyesight was always feeble." Two of these statements may be questioned—that his hair was "*prematurely* tinged with gray" and that "his eyesight was *always* feeble."

# Fine Arts.

## FIFTIETH EXHIBITION OF THE ACADEMY OF DESIGN.

II.

A CLASS of painters that has arisen of late years—young Americans studying awhile in Paris or Munich, and then going about, like students of the Middle Ages, to debate their art in all the centres where the profession congregate and models are to be hired—this class, bringing home to our exhibitions a very fresh reflection of some foreign professor's style, has strongly colored the recent collections shown at the Academy. The influence

is on the whole good; for along with the frank mannerism and the prize-poem sort of faultlessness, there is the look of training, of conscience, of nature-copying, and almost all that our older artists most needed in their own youth. So long as the influence of Piloty can contribute to the painting of such a head as Mr. Neal's great "study" (207), there will be no complaint to make. Nor can anything but praise be awarded to the pupil of Gérôme and Boulanger, Mr. Bridgman. This artist, since his studies in Brittany, where he used to pursue to their finest results the subtleties of light and shade, has, however, been travelling in sunny countries, such as Spain and Africa, where he has been tempted to simplify his breadths of light until they reach a sometimes awkward flatness. This is the case not only in fully-illuminated scenes like the street-view in the Lower Pyrenees and the Oriental love-passage, but in scenes under cover, such as the picture of a circus, where a stronger style of modelling is permitted and demanded. Except for the thinness of the relief in these circus-figures, whose roundness is somewhat less than the cameo on a brooch, the picture, with its varieties of rustic character and the nonchalance of its performing horses and human beings, is very admirable. The animals in the study from the Pyrenees are perfect in action and solidity, and the Boulanger-like love-scene is neither better nor worse than a good Boulanger. Mr. Edgar M. Ward sends three pictures from the simple Breton country-life, the figures modelled in reflected lights, as in some of the twilight or shaded compositions of M. Breton; these subjects, like terra-cotta groups, have the simplicity, solidity, and firmness of Nature, if on the other hand they lack her transparence and fluency; as the compactly-moulded Bretonnes wash at the water-side or tend their narrow homes, we feel that the placid animal aspect of humanity is completely rendered, not without occasional glimpses of that simple and untrammelled nobility attained now and then by an unspoiled peasant or a Greek statue. In one of Mr. Ward's pictures there is an old woman placed by a doorway, which attains a higher grace; in this figure there is intricate and shadowy modelling, with the tenderest relief and most perfect composition. Another excellent picture, by Mr. Weir, who sends but it alone, is the interior of a Breton kitchen, where a woman attentively spins and a half-seen man effaces himself amongst the soot of the chimney-place. This whole composition, apart from its very sufficient grasp of character, is a study of melting shades deepening to apparent blackness without anywhere losing transparency, and is on the whole a profound lesson from the mysterious art of the Dutch painters. The picture, as an effect of chiaroscuro, is made to tell better and more by a judicious use of black in the framing "bead," which sets an italic line, as it were, under the particular emphasis of shade desired. Mr. Van Shaick, whose injudicious subject in "The Song" did not make us blind to his very real qualities as a painter, has now improved upon himself with a quiet and firm picture of a man in armor. The delineation here is inexorably close, and the artist shirks none of the difficulties of life-study; the work has the thoroughness and wholesome harshness that remind us of Albert Dürer.

Genre pictures of another class are those of Eastman Johnson. His study of a lady in velvet dressing-gown attaching an earring is rich and simple; his "Pedlar," frugally economizing his strength by the living-room stove, and looking on with senile long-suffering as a country beauty is buying hairpins, pleases us entirely; his "Milton Dictating" we dislike, as we think the drawing woolly and confused, and consider that in this age of good biographies there is no excuse for a painter's mistaking, in the melodramatic direction, the character both of the daughters and of the poet. Mr. Jervis McEntee, along with some landscapes in his highest style which are just now apart from our consideration, ventures to exhibit a figure-study, a "Ginevra" disturbing the cobwebs of an old lumber-room to enter the chest. It is an unlucky experiment, but in certain parts shows a knowledge of figure-painting destined to do good service, we doubt not, among the artist's pastorals, now so cold, lonely, and bereft of human interest. A painter of small figure-groups, who up to this time has hardly received enough notice, is Mr. Wordsworth Thompson. His slight and elegant way of sketching populous groups into landscape is truly enjoyable in its kind; his poses are distinct and firm, his color is silvery, and his masses are clear-cut and broad. When he chooses to represent burgher-life by the seaside, he is direct and epigrammatic in his delineation; when he chooses to go into backwoods simplicity and show the hunter's naked children playing beside the chimney made of a barrel, and staring awkwardly at the brisk young scout on horseback, he is as primitive as a chapter of Cooper; when he likes to invade the antiquarian domain of Mr. Henry, and show the gigmanship and respectability of old yellow cabriolets and handsome Queen-Anne mansions in antique Virginia, he is satisfactory even in bric-à-brac. Mr. Henry himself is this year at about his best, showing the candle-light effect with energy and acumen as the old maid prepares her nightcap. His want of broad composition, however, is almost fatal. Mr. Guy, in a small night-scene of a boy and violin, looking as if painted on kid, certainly exceeds Von Schendel in his own direction, though why any artist should want to exceed Von Schendel in his own direction we cannot tell. Mr. Magrath sends two Irish pastorals, like verses of ballads sung by a fresh, untrained, reedy voice. The landscapes are admirable and perfectly support the figures; but the latter are somewhat solid and monumental, with attitudes just a shade too elaborate.

JUST PUBLISHED.

*Sainte-Beuve.*

English Portraits. By C. A. Sainte-Beuve, of the French Academy. With an Introductory Chapter on his Life and Writings. 12mo, cloth, $2.

*Mrs. Alexander.*

Ralph Wilson's Wierd. A Novel. By Mrs. Alexander, author of 'The Wooing O't' and 'Which Shall It Be?' 16mo, Leisure Hour Series, $1 25.

*HARPER'S CATALOGUE.* The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

SECOND EDITION.

*HELPS TO PRAYER.*

A manual designed to aid Christian Believers in acquiring the Gifts and in maintaining the Practice of Prayer in the Closet, the Family, the Social Gatherings, and the Public Congregations. By Rev. D. P. Kidder, D.D. 12mo, $1 75; Red-line edition, toned paper, gilt edges, bevelled boards, $3 50.

COMMENTS OF THE PRESS.

"We believe no earnest person can read this volume without gaining great benefit."—*Christian Union.*

"It has been prepared with intelligence, judgment, and care."—*Christian at Work.*

"We commend it to the attention of all."—*St. Louis Christian Advocate.*

"Its spirit is excellent, its tone elevated."—*Morning Star.*

"It must do good among all intelligent, thoughtful, and devout Christians."—*Christian Intelligencer.*

NELSON & PHILLIPS, PUBLISHERS,
805 Broadway, New York.

*"THE READER" discusses on page 284, a new translation of Aristophanes and novelties of Japanese fiction, published by Macmillan & Co.*

*Art-work in Silver*

*The Gorham Company*

No. 1 BOND ST., NEW YORK.

The most extensive and brilliant collection of rich

*BRIDAL GIFTS,*
*TESTIMONIAL PIECES,*
*FAMILY SILVER,*

etc., etc., to be found in the city, now offered at retail at the lowest possible prices.

The Gorham Stamp is an evidence of sterling purity and excellence alike to the purchaser and receiver.

*The American Educational Cyclopædia.*

A Reference Book for all matters of Education in the United States and in the World.

It is valuable for Teachers, School Officers, Clergymen, Lawyers, Editors, Politicians, and Parents with children to educate. It is endorsed by the highest authorities in the land, among which are forty-seven out of the forty-eight State and Territorial Superintendents. It contains 300 pp. bound in cloth, $2; in manila covers, $1 50.

## The Week.

DURING the past week the rumors of Cabinet changes have taken very definite shape, and it is understood that Mr. Williams is to retire, while it seems that the only hesitation felt in Mr. Delano's case is that he, being now "under fire," ought to be retained in office until he may voluntarily leave it. The military theory as to tenure of office, in its perfected form, seems to be something like this: Any officer who knows that he has been guilty of misconduct, fraud, or peculation, and finds his conscience oppressed by the fact, may, if he pleases, resign, and in that case he will not be prevented, and the usual complimentary testimonials will be exchanged and published; second, if any officer steadily sets his face against misconduct, fraud, and peculation in office, and thereby creates much hostility among the supporters of the Administration, he also may resign (and if he does not wish to go, he will be asked to resign), with the usual complimentary testimonials. If, however, any officer is accused of improper conduct by the press, he will be entitled to testimonials at once, without the question of his resignation being raised, and he will remain in office until the wicked editors cease their attacks. Mr. Delano has been suspected of the grossest kinds of corruption, and charges have been openly brought in the newspapers. But far from any enquiry being ordered, or even an investigation being demanded, a formal testimonial was at once "tendered," not by people who knew anything about the facts, but, of all persons in the world, by a number of "Heads of Bureaus" in the Department of the Interior, subordinates dependent on Mr. Delano's favor for their daily support, and who solemnly, each in turn, vouched for the business of the office having been conducted in a perfectly regular manner by their chief.

---

A vigorous attempt to get up another revolution in Louisiana has been made, but without success. By the terms of the Wheeler Compromise, as it is called, the Republicans agreed that the House of Representatives might be reconstructed so as to give the Democrats the majority of which they had been deprived by the illegal action of the troops; and, on the other hand, the Democrats agreed not to impeach Kellogg for any past offences. There was no promise given beyond this on either side as to the House of Representatives, and accordingly that body, exercising its normal and regular prerogative, began to enquire into the qualifications of some of the other members. There was no reason why this should not be done, any more than there was why Kellogg should not be impeached for future offences. Indeed, the excitement got up over it in some of the Republican papers shows a curious state of mind with regard to the functions of State governments. If the Louisiana government is ever to be carried on at all, it must be by the usual means—by legislation, by seating and unseating members, by executive acts and proclamations, and by judicial decrees. If the "Wheeler Compromise" is to be taken to mean that the government of the State is to remain to the end of time paralyzed, without power of action in any direction, the quarrel might better have been left to the banditti and the troops to settle between them. But the fact is that the notion that the population of the State are a wild set of murderous savages seems to have taken such a vigorous hold of the minds of a certain number of people at the North, that not even the most sensible, civilized, orderly behavior on the part of the savages themselves can force it out of their heads.

To show that we do not exaggerate in what we say, we quote from the Boston *Journal* of April 26, which is made very sad by the contemplation of the behavior of the Conservatives:

"In fact, when one considers this development of Conservative bad faith, he is apt to be reminded of General Sheridan's epithet of 'banditti' as one not so far out of the way as many enemies of the frank, blunt soldier had supposed. We are yet loth to believe that the majority of the Conservatives of Louisiana approve this treachery of their representatives in the legislature, but still they cannot evade its responsibility. The men who have got command of the party there are thoroughly untrustworthy. That fact has been one of the great sources of trouble all through the Reconstruction period. It is time that the North fully understood it. It is on this account, in part, that we have advocated the withdrawal of all Federal interference from Louisiana, so far as the protection of life and property would allow, in order that the ex-rebel leaders might show their true character to the whole country."

The best comment on this is the fact that the Legislature has now adjourned, and the "banditti" returned to their homes without shedding a drop of blood. We hope the *Journal* will return to the subject, if it is not too melancholy, next week.

---

Judge Blatchford's decision in the Dana suit does not announce any new or important principle of law, and turns mainly on a technical question as to the jurisdiction of the court which subpœnaed Mr. Dana. But the case is important for all that, as illustrating the extraordinary attitude of the Government to the press. When we reflect that Washington is the capital of the country, the centre of the Administration, the headquarters of a powerful Government, one of whose main functions is the administration of justice, and then remember that an arrest of one editor has been procured in it contrary to all law and precedent, at the request of an intimate friend of the head of the Administration, and that another hostile editor has been summoned there in a case of which he protests that he knows nothing, we cannot but regard every attempt to take members of the press to Washington to try them as, to say the least, suspicious; and we may add that we believe the decision of Judge Blatchford, in so far as it discountenances the notion that a petty local court ought to have power to send for witnesses all over the country, is salutary. There is something so preposterous about the idea of erecting the tribunals of a little "geographical expression" like the District of Columbia into tribunals having powers beyond those of the States even which framed the Union itself, that we feel confident it ought to be frowned upon by the courts whenever they can find an opportunity to do it.

---

A piece of news going the rounds of the papers, relating to the anticipation by Spain of the payment due on account of the *Virginius* indemnity, has attracted a good deal of attention; at the same time that another fact, showing the honorable intentions of the United States as regards Spain, has attracted but little. The news to which we refer is the condemnation, in a United States Court, of the *Edgar Stewart*, a piratical vessel intended and, we believe, used by the Cubans for filibustering attacks. At about the time of the capture of the *Virginius* the case of this vessel attracted a good deal of notice. Whether she would ever have been seized if the *Virginius* had not tried to land an expedition seems open to much question; the evidence against her could hardly have been stronger than that which satisfied Mr. Williams that the *Virginius* had no right to carry the American flag. At any rate, the arrest and condemnation of the vessel are a good proof of the *bona fides* of the Administration, and, taken in connection with the very successful negotiations with regard to the indemnity, are, we hope, an earnest of a new state of feeling and action on Cuban-American affairs. It is surprising to reflect how distinctly even

the average politician's mind has been relieved within the last few years of that terrible anxiety which used to burden it as to the Anglo-Irish difficulties, Fenianism, and so on. Since the Government determined to treat Fenians not as a nation struggling against six hundred years of wrong, but as deluded adventurers led by political desperadoes in a campaign of petty larceny and murder, Fenianism has passed for exactly what it in reality is. It is impossible to hope so much with regard to Cuba, for Spain is not England, and Cuba is a far worse-governed and more hopeless province than Ireland has been for many a long year; still, there is no doubt that such proceedings as those which have led to the condemnation of the *Edgar Stewart* will do much both for the peace and the honor of the country.

---

The Centennial Exhibition stockholders have been called together to hear the report of their directors; and it would seem that, with proper exertions, there is no reason why the exhibition should not be a success. Many foreign governments have signified their intention of being properly represented; there have been in round numbers a million and a half of receipts and a million of expenditures, leaving half a million and more in the treasury; and, with three and a half millions of additional subscriptions, the managers expect to accomplish everything necessary. It is obvious that the exhibition must be mainly one of natural products of the soil and manufacturing industry, and it will therefore depend upon trade subscriptions for money. There could not be a better way of testing the popular interest in the exhibition than this, for, if it succeeds, nothing more is desired; while if it fails, the absurdity of an appropriation from an impoverished Treasury is proved to a demonstration. This meeting of the stockholders, by the way, shows that the position we took a year ago in these columns—that the concern was essentially like any other large corporation, with a fluctuating body of stockholders and a small number of directors—was correct, and that the extraordinary notion put forward by one of our correspondents, that, the corporation once formed, any one who had a hand in forming it became *functus officio*, was totally erroneous. In its present condition, we wish the enterprise all success, and see no reason whatever why, with proper assistance from those most interested, it should not meet with all it deserves.

---

The next important centennial, following the celebrations at Lexington and Concord, will be observed at Charlotte, a village in Mecklenburg County, North Carolina, on the 20th of May. At this place, it is alleged, in 1775, there was passed a series of resolutions which expressed sympathy with the sufferers at Lexington, and also formally declared the inhabitants of the county to be absolved from all further allegiance to the mother country. The genuineness of these resolutions has been disputed by historians, and when they first appeared in print, in 1819, Thomas Jefferson declared them to be forgeries. Having been accepted, however, by vote of the Legislature in 1831, and also by several local historians, they are now generally received and credited throughout the State. It is quite probable that resolutions of a somewhat similar, though perhaps less decided, character were really passed some time in May, 1775. Following the Mecklenburg celebration will come the hundredth anniversary of the battle of Bunker Hill, on the 17th of June, extensive preparations for the celebration of which are now making at Boston, both Bunker Hill and Breed's Hill being now within this city's limits, since the annexation of the former city of Charlestown. Additional evidence that the various centennial celebrations are destined to renew a good portion of the fraternal feeling which formerly existed between the Northern and Southern sections of the country is furnished in the fact that a militia company from Norfolk, Virginia, and also the mayor of that city, will visit Boston and take part in the exercises of the 17th of June. As might have been expected, some of our social agitators, probably believing that all this centennial "sweetness" should have its full share of "light," are trying to make capital for their pet theories. The woman suffragists, for instance, are endeavoring to persuade the women taxpayers of Lexington and Concord to refuse to pay their proportion of the money voted by the towns for the anniversary celebrations at these places, on the ground that by so doing they would be following the example set them by their forefathers in resisting "taxation without representation." Mrs. Lucy Stone, at a meeting of the Middlesex County Association at Melrose, declared that "if she were an inhabitant of Concord she would let her house be sold over her head, and her clothes off her back, and be hung by the neck, before she would pay a cent of it."

---

A genuine mining excitement has broken out in the old and quiet town of Newbury, in the northeastern corner of Massachusetts, consequent upon the recent discovery of silver ore in that place. There is no doubt that both silver and lead have been found in "paying" quantities, but there are grave doubts as to the length and depth of the veins, and the continuance of a percentage of metal sufficient to pay the expenses of regular mining. These uncertain elements of the problem will have to be determined by actual experiment. In the meantime, the speculative fever has set in, the price of land has been run up, companies have been formed, and sales of mining privileges have been announced at even a million dollars—a price which must strike the old settlers dumb. The fever may be yet further increased by the reported discovery of gold, last Saturday, in Georgetown, immediately adjoining Newbury, this latter discovery being made by the man who first discovered the silver. Staid Newburyport is displaying specimens of silver-ore in its shop-windows, and the passer-by may read strange announcements concerning "Compton's Lode," "Devil's Run," etc. It is no new thing to discover silver, lead, copper, zinc, and even gold in Massachusetts, especially in the western part of the State, near the Connecticut Valley, but, heretofore, every attempt at mining has been followed by loss of the money invested, none of the metals being found in paying quantities. The accidental discovery of silver at Newbury was used as an argument to induce the Legislature to appropriate money for a thorough scientific survey of the State. Other arguments as good and better were urged, and there was no lack of them, but we regret to see that the petition was defeated by a tie-vote in the House. It was asserted that forty years would be required for fifteen parties, of five persons each, to complete the survey of the State. Had this been true, and not, as we believe, a gross exaggeration, it would still have been no excuse for postponing a work to which the United States lends the gratuitous service of the Coast Survey, and which must sooner or later be undertaken and carried through. Considering the value of her example in this matter to other States, Massachusetts should have reflected that *noblesse oblige*.

---

It is just five years since the readers of the *Nation* first made the acquaintance of Capt. Niles G. Parker, then as now of South Carolina, and from 1868 to 1872 the Treasurer of that unhappy State. In May, 1870, we were assured by a well-known religious weekly in this city and by a well-known philanthropist that Parker had "restored the State to solvency," and had "brought order out of chaos, and had made South Carolina the first of the seceded States to pay the full interest on her debt." In August of the same year, it transpired that more than half a million of the State bonds had gone to protest in 1868, and that neither principal nor interest had since been paid. In May, 1871, Governor Scott assured the Taxpayers' Convention that "nothing had been done involving the credit of the State not strictly authorized by law." In November following, the same Governor, the treasury being empty, declared Parker guilty of fraudulent issues, and in December a legislative committee advised the impeachment of both Governor and Treasurer for the crime which the former sought to shoulder upon the latter. By a vote of two to one, however, the House refused to impeach, and both

offenders went out of office when their term had expired, unwhipt of justice. On Wednesday week, it gives us pleasure to record, Parker was arrested at Columbia, on the complaint of the Commissioners of the Sinking Fund (Gov. Chamberlain at their head), on the charge of embezzling money from that fund to the amount of $28,100 while Treasurer; and having been required to give bail in twice that amount, failed to do so, and was sent to jail. The next day a fresh suit was begun against him by the Attorney-General for a fraud estimated to have cost the State $225,000, and committed in the years 1869, 1870, 1871. It appears that while he was engaged in "bringing order out of chaos," by paying coupons on valid bonds, he "put aside $250,000 of such coupons uncancelled, and in their place as vouchers put coupons which he cut off from the conversion bonds in his office, which, according to their dates, must have matured at this time." Nearly all of these uncancelled coupons have been funded at the Treasury during the present year. Altogether, Parker must procure bail in excess of $300,000, which is of course impossible for him, and if he ever comes to trial, there seems to be every probability that he will get his deserts. A career which began in Haverhill, Massachusetts, as proprietor of an unsuccessful and disreputable restaurant and bar, and which, temporarily disguised by service in the army, recovered its true aspect when Parker went into business in Charleston, failed and paid thirty cents on the dollar, then went into politics, then went into the Treasury and began stealing, and lying to conceal his thefts, will find a fitting climax in the penitentiary. We ought to add that Governor Chamberlain's active prosecution of Parker gives us great satisfaction. They were both formerly colleagues with Scott on the Financial Board which appointed the State agent who killed the State credit in 1871, and the then Attorney-General naturally shared the odium which attached to the majority of the Board. His silence then will be atoned for by his action now

---

The dinner given to Mr. Schurz on Tuesday, though not political in the strict sense of the word, had, from the speeches made at it, an important political bearing. The sentiment most strongly expressed in these, and perhaps best expressed in the remarks made by the presiding officer, Mr. Evarts, was the hope, and we may almost say the determination, of independent men that in the next Presidential election the country shall not be forced to choose "the least of two evils," and their profound indifference as to what party-name the candidate may bear, provided he be fit for the office. To quote from Mr. Evarts:

"There is a very great and increasing number of people in this country who believe that an elevation of American politics is a good thing. We would like to see some of the old competition in public life with which we have been familiar in the mother country, and of which we have known and read so much admiringly in our own, in which the prosperity of the contest depended upon the superiority of the successful combatant, and not upon a close calculation of which had the greatest defects."

To Mr. Schurz the dinner was more than the compliment such dinners usually are; for no one present could help seeing how genuine and sincere are the regrets of a large number of the best people in the country at his temporary retirement from public life, or wondering at the partisan folly which has driven him out of it.

---

With a continuance during the week of unseasonable weather, general trade has been quiet. The injury to the crops turns out to have been overestimated. In the markets, there has been little change in cotton, and that little a reduction in the price. In Wall Street, the week has been a quiet one; money continues abundant, and rates for loans have a declining tendency; the banks have now a surplus reserve of about $11,500,000, and currency is still accumulating. Gold exports have at last begun: nearly $2,000,000 gold coin have been exported during the week, and this not because Europe demands gold of us, but because there is little else to ship except gold and securities, and thus far Europe shows no disposition to take our securities. Mr. Bristow has called in $5,000,000 more 5-20 bonds, which will add to the danger that we may be obliged this summer to ship such an amount of gold as seriously to imperil the bank reserves next autumn. At the Stock Exchange, the demand for first-class investments has been almost without precedent. U. S. bonds have sold in currency higher than ever before. Good railroad bonds have gone up to figures which seem strange in a country where money is supposed to be worth more than at the money centres of Europe. It is almost impossible to get a good first-mortgage 7 per cent. railroad bond below 105, and some are quoted as high as 115. The next lower class of bonds range from 95 to 105, and railroad shares accounted good dividend investments are also feeling the effect of this investment demand. In speculative shares, the tendency continues upwards for those in any way connected with the Pacific railroads. Roads between this city and Chicago are, however, doing a poor business, both on account of the low rates and the meagre traffic, and their stocks have declined. The Union Pacific speculation overshadows all others, and the plausible exhibits put forth in the interest of the company are inducing many to buy its shares who looked upon them with contempt when selling for half their present price. The difficulty between the Union Pacific and the Panama has been settled; the latter gets enough in the shape of what may be called a royalty on the Pacific traffic to enable it, with its other business, to declare 20 to 24 per cent. annual dividends, and its shares have been up to 172, a rise of 27 per cent. There is now a practical monopoly established in the interest of the Pacific railroads on all trans-continental business, with no limit to its charges except such high rates as will stop business. The Pacific railroads by it add to their net income about $6,500,000.

---

Just what Bismarck has been driving at in his exchange of notes with the Belgian Government it is not yet possible to guess with certainty. Was he really expecting that Government to restrict by new legislation the constitutional liberties of the country, or was he seeking to intimidate his Ultramontane enemies at home under pretence of giving no peace to their abettors in neighboring states? Or was his first note preliminary to picking a quarrel, with a view to the forcible annexation of Belgium, Luxembourg, and who knows what else? Whatever his motive, he succeeded in exciting apprehensions of war not only among lookers-on, both Gallic and non-Gallic, but in the minds of the German people. They knew that the Government had prohibited the exportation of horses from Germany for the equipment of the French cavalry and artillery. They saw in Belgium a possible, indeed the only remaining, highway for French armies into Germany. In the midst of these rumors the semi-official *Post* came out with a declaration that "war was in sight, though the cloud might yet be dispelled." Then the German imagination discovered a plot between France, Italy, and Austria against Germany, and at once "saw blood." The article in the *Post* was interpreted as Bismarck's intimation that he knew what was going on and would not be caught napping. Under the powerful impression made by this article throughout Europe, our Berlin correspondent writes (April 11):

"There is no doubt that the Government are, or at least have been, entertaining very serious apprehensions. I know from an absolutely trustworthy source that Moltke said to one of the most prominent members of the Landtag that, about two weeks ago, it looked for a whole night as if war was sure to come; the Government expected every moment to get a despatch saying that France celebrated the completion of the reorganization of her army by pouring her regiments through Belgium into Germany. Moreover, you know that the Emperor has been compelled by his physicians to give up his intended visit to Italy. It was, however, at once announced that the Crown-Prince would go in his stead. That was really intended, for the court-jeweller received the orders for the gold boxes, etc., which princes are in the habit of presenting to distinguished persons on such occasions. Now these orders have been countermanded. This, although not known to the public—the press has as yet not so much as hinted at the possibility of the Crown-Prince's not going to Italy—is a fact I can vouch for. That, of course, does not preclude the possibility that, in a few days, the order may be renewed. If the Prince should go after all, that might, perhaps, be taken as a sure sign that the storm has happily blown over."

## THE GOVERNOR'S POWER OF REMOVAL.

UNQUESTIONABLY the two chief causes which thwart the political will of the American people at the present time are, first, the incapacity or malfeasance of those in office, and, second, the controlling power of certain combinations, generally known as caucuses and rings, in determining selections for office. These causes move in opposite directions, and the majority of men are too apt to estimate them singly, as though either were the only evil to be encountered in redressing our political grievances. He whose attention is called to the administration of public affairs sees clearly enough how incompetently and corruptly public affairs are managed; and he who turns his attention to the election or appointment of administrative officers encounters immediately a powerful influence behind the public will, which, in nine cases out of ten, annuls the good that the better part of the community strives to accomplish. Looking at the subject from these different points of view, it is not extraordinary that there are different sets of men honestly coming to opposite conclusions. One set can see that efficient and honest government requires that an unknown number of officers be promptly evicted, and the only instrumentality by which prompt eviction can be secured is the discretion of some single mind, which must ordinarily be that of the executive. Prompt eviction for incompetency or dishonesty in office is desirable, and this all men will admit, but no inconsiderable portion of the community have learned, in our modern experience, that removals from office take place more rarely for these causes than for any other. If removal for neglect of duty, or even for malfeasance, had been the invariable rules with our National and State executives, the power of removal would now be the most popular power that could be vested in either Governor or President.

But when another portion of the community examine the question from their point of view, they see with equal clearness that removal from office is ordinarily nothing more than an abuse of power, the purpose ordinarily being to turn out the experienced merely to make way for the inexperienced, and the motive being no better than to get rid of one's opponents and make places for one's friends. The first class hope for improvement in change; the second are suspicious of change, believing that no higher grade of morality will be secured, and a less experienced set of hands be employed upon the official work. In other words, they believe the change will merely be adding incapacity to dishonesty.

But a third class, who are accustomed to couple with the power of removal the power of appointment, will be found to argue strenuously that the Executive can best select administrative officers, and that it is highly desirable to bring responsibility for administrative affairs home to somebody who can practically be held accountable, by being kept in or turned out as he behaves or misbehaves himself, for the selection of his appointees. If we could stop with this reasoning, the way for approaching excellence in our governmental affairs would be plain, and a constitutional amendment or two would do the business. But unhappily a fourth set of men are ready with arguments to show that this hope is utterly delusive. They assert that such selections do not, and in the present condition of our political affairs cannot be secured; and they can point in almost any direction and not go far from finding an illustration to confirm their assertion.

The truth is that no intelligent person can rely upon any one of these sets of views. Each is in the main sound so far as it goes, but none embraces the whole field of facts which the reformer should survey. Where robberies in office are going on, such as the last four years have disclosed in this city—such as the past winter has added to the official history of the State, there should be an instantaneous method of *removal*, while we refer *punishment* to the more tardy processes of the courts. Furthermore, our experience in this State is a conclusive demonstration that removal by impeachment or by indictment, or by the Governor and Senate, or by the Governor on a formal investigation of some local magistrate, is neither instantaneous nor valuable, nor ordinarily effective; but, on the contrary, in nearly every case where it was tried proved to be a vexation or a farce. That is to say, the only really effective means yet discovered for getting a scoundrel out of an office is to give to somebody official authority to put him out.

But when we go to the other side of the field of facts we find that while it is indisputable that public officers are selected by political conventions, which in turn are selected or managed by a class whom decent citizens least trust and most abhor, nevertheless the appointing power is also selected, and the appointments largely managed, by the same set of men who control the nominations of the elective officers. It is indeed a difficult and alarming condition of the problem that so few of our chief officials, whom we popularly call "the appointing power," go into office by really popular selection, or possess a real moral freedom to do that which they know to be right. We have to deal with the inconvenient fact that a debased condition of politics has enabled a debased set of men to acquire power over the ordinary mayor or governor, and if not to secure from him all kinds of abject pledges, at least to do that which is almost as dangerous—viz., to lay him under what are called obligations of gratitude.

We have had so much of the good and the bad in our public experiences, that almost any one can prove his side of the case by what is called experience, if we allow him to take a fraction of the general experience instead of the whole. From these vicissitudes of public affairs the public have slowly gathered the idea that the best thing that remains for us is to clutch at any temporary good that comes in our way. At the present time we have a Governor who has singularly risen from being the leader of an unsuccessful party to obtaining the confidence, and in a very unusual degree, of the respectable men of all parties. It is needless to add that he has obtained this by his fearless warfare upon the worst members of his own party. At the same time we have spread before us the exposure and, indeed, the demonstration of a prolonged series of frauds and robberies which have well-nigh made the most important property of the State entirely valueless. The two things coming together have naturally enough suggested a proposition for giving to Governor Tilden what the governors of this State so long have been deprived of—an unlimited power of removal.

These two powers of appointment and removal are not necessarily united or interdependent, and no sound reason exists for inferring that if we cannot or should not entrust the Governor with the one, therefore we must withhold from him the other. Indeed, there are some reasons why the two should not be united in the same individual, for the latter has constantly been abused in this country, and the abuse has always grown out of the possession of the other power. In monarchical governments the two are vested in the executive; but in monarchical governments changes of the executive are comparatively rare, being measured by generations, and there will never be any great danger from an executive's removing his own appointees. The trouble with us has been that the executive has constantly found another man's appointees in his way, and that high party feeling and torpid public sentiment have allowed them to be gotten out of the way by the abuse of a salutary power. If public sentiment had been so high that removing an upright man from office merely to give the place to one of a different party would have been regarded as scandalous; if it had been so exacting that a Whig governor who removed a Democrat would have been required as a proof of his disinterestedness to appoint a Democrat to the same place, no constitutional change in this respect ever would have been made, and we should now, with substantial unanimity, be regarding the power of removal as one of the most valuable elements of popular government. It may be confessed that there is a seeming incongruity in keeping a ring to select improper officers and an executive to turn them out; but the incongruity is more seeming than real. The power of removal in the present condition of affairs means simply a limit to official vice. The error does not lie in removing rogues from office, but in allowing them to get there. And hitherto the great inducement for

rogues of a certain size to buy their way into office has been not the inadequate salaries which we generally attach to places of responsibility, but the certainty that he who gets there may remain, no matter what he chooses to do. The extraordinary system of official malfeasance which in the last thirty years has grown up in an industrious and well-meaning community that boasts of its right of self-government, is founded on a political system which provides easy means for putting a man into an office, and, during its term, leaves the community with no practical remedy for turning him out. Practically, we have been saying for twenty years to the gentlemen whom we are fond of calling "our public servants": "You may draw your salaries and do as little as you please. The duties of your office you may leave undone, and its powers you may pervert to enrich yourself and your accomplices. When your term expires, we may try to prevent your coming back again, but the chances are that at that time we shall be hopeless of getting any one better, and that your friends who sent you the first time will send you here a second, despite anything we can do. Should you chance to be indicted, you can easily delay the trial until your term expires, and then get yourself elected to a better place. In short, there is no accountability which an expert official has the slightest reason to fear."

Such being the rule by which we have lived for some years, the question really is whether we intend to adhere to it for ever. The distrust which evidently lingers in the minds of many who even advocate it, really belongs to the question of restoring the appointing power. As we have before shown, the two powers are not interdependent, and the latter question cannot now be decided. In a vitiated state of politics like the present, it may be that the best way to secure the purity of the executive will be to keep all patronage out of his hands. But, be that as it may, all that can be done this year or next will be to act upon the distinct subject of leaving the public business of the State in the unrestricted hands of whosoever happens to grasp it. It is unhappily true that we have been standing for a long time in the mire, and it is undeniable that we cannot wholly extricate ourselves by a single bound; but that seems hardly a good reason for refusing to lift one foot out of the mud and plant it upon solid ground.

## A FIELD FOR "PUNCH" IN AMERICA.

SEVERAL years ago a discussion was carried on by some of our newspapers and magazines upon the subject of the non-success of humorous periodicals in this country. Although innumerable attempts had been made, it was stated, to establish permanently a publication of this kind, nevertheless the death-rate had steadily kept pace with the number of births. To cheap prints, filled with comic sketches whose coarse vulgarity bordered closely upon indecency—to more praiseworthy attempts to give expression only to the best forms of wit and genuine humor—to the many conceivable and sometimes brilliant varieties between these extremes—the same fate sooner or later was sure to come. Not a single case of real success could be pointed out. But that which greatly increased the natural aggravation attending this unbroken series of failures was the fact that during all this time the well-known London *Punch* steadily maintained a well-earned reputation and tantalizingly continued an undisputed success. Why had there been this persistent difference between the results of similar attempts in the two countries? If *Punch* could succeed in England, why should not a corresponding periodical also succeed in America?

Among the answers to this question was one to which we believe there was no reply at the time, and which was expressed somewhat in this wise: Throughout the various grades of English society the lines of demarcation are broad and pronounced to a degree which an American cannot easily understand. These existing differences are made still more decided in popular apprehension by the effects of tradition and education, so that the distance between an earl, for instance, and a chimney-sweep appears enormous and impassable, and when the one is represented as employing, either by accident or design, the customary words or manner of the other, the incongruity is not only immediately but also keenly and ludicrously apparent. This illustration perhaps is an extreme one, but serves the better to indicate the fact. Now, from these social incongruities *Punch* obtains directly or indirectly a large amount of its best material—material which is shaped and ornamented in accordance with every sort of crude and delicate fancy. This kind of material, which in abundance and variety seems essential to the success of a humorous periodical, is almost entirely lacking in America. Here, where, according to a popular writer, a railway engineer in his good clothes may resemble a robust professor of geology, and is very likely to have his cloth cut by the professor's tailor, it is almost impossible to define class distinctions, and the highest and lowest classes are not far enough apart to give birth to any idea of incongruity when brought together. With us it is almost impossible to represent one class mimicking or parodying the ways and speech of another. Our sole effective illustration of incongruous relations between social extremes is produced by the juxtaposition of the imported servant-girl and her mistress, and this has been so long employed, over and over again, that, in common phrase, it is "used to death," and now has either lost all effect, or, if it retain any at all, is more likely, for special and well-known reasons, to excite anguish rather than mirth. Therefore (the inference followed from all these statements), being without the most necessary material for easily sustaining a humorous periodical, it was hardly possible that one could ever be made to succeed in this country.

We have not recalled the above discussion for the purpose of taking any part in it, nor shall we pretend to decide upon the validity of the premises from which is drawn the final conclusion. Our present purpose is to call attention to the fact that, granting to the above statements all the force which may fairly be claimed for them, there is nevertheless an extensive field for *Punch* in America—a field which may eventually be more profitably tilled than that which has been so long and so successfully worked in England. The moral profit of the undertaking, we are persuaded, would repay immediate investment, though for pecuniary profit it may be wise to wait a little longer.

When paterfamilias at breakfast-table recently read aloud from the morning paper that P. T. Barnum had been elected mayor of Bridgeport, the proceedings against coffee and omelet were arrested on the part of every member of the family circle long enough to allow the features to express the transient reception of an absurd idea, which took its departure in company with various brief and gentle exclamations. Between the traditional idea of the chief-magistrate of a city and the traditional idea of a showman, there is an incongruity so great that it is not possible to put the two together without exciting feeling of some kind—it may be contempt, or wonder, or mirth—but whatever it may be, it is of the same kind as that which results from the material out of which *Punch* fashions its social humors. Moreover, when we remember that the chief-magistrates of our cities are sometimes formally installed at the conclusion of an "inaugural procession," and then recall the character of the processions in which Mr. Barnum has hitherto borne a prominent part, we are confident that *Punch* can picture no greater incongruity when he puts together a nobleman and an organ-grinder, or represents the one attempting to perform the functions of the other. We say this, fully granting the possibility that Mr. Barnum as mayor may prove to be as good as, or even better than, the average holders of that office; for he is an exceptional showman, and holds certain exceptional relations to the city of Bridgeport. We mention his case as the most recent, rather than the best, illustration of what we are endeavoring to set forth—namely, the ludicrous incongruity between the function of many public offices and the character and attainments of the men who are frequently elected or appointed to fill them. What, again to illustrate, can be more utterly unlike than the functions exercised by a Methodist clergyman and the functions of an inspector of American consulates in foreign ports? We confess that our imagination completely fails in the effort to suggest the answers given by some of

our consuls to certain questions in the catechism, which must have been put to them by their official inspector upon his recent visit. The unlikeness of function in this case is fully equal to that exhibited in the case of a man said to have been elected to the English Parliament many years ago, who wrote (or could write) after his name "Prize Fighter and M.P." Of course we need not mention a recent parallel instance in our own politics, nor remind our readers of the absolute satire contained in the appointment of a Southern member of Congress, whose inimitable "*thar*" is the delight of the galleries, to a position upon the Committee on Public Education. But illustrations of our meaning are unfortunately so plentiful that every reader can readily supply them from his own immediate surroundings.

Apart from all theories of the origin of civilization, it is universally admitted that only the savage is capable of properly doing all things necessary to ensure the most perfect happiness possible to the state of society in which he lives. He only can be hunter, butcher, cook, arrow-maker, builder, legislator, priest, and root-digger rolled into one. All progress in civilization is necessarily attended with greater and still greater specialization of pursuits. It is almost impossible to-day for a man to be at the same time a butcher and an oculist, or for an artist to attempt to drive a pegging-machine. The skilled workman is he who knows how to do one thing, and does that one thing well. "Jack at all trades and master of none" was never truer than at the present time; but it will be truer to-morrow than it is to-day. This rule of fitness, the rule that training and natural faculty are demanded for whatever one may undertake to do, is becoming daily more imperative; and the rule should have no exception when applied to the holders of public office. From president to village alderman, the relation to function should be as precise, to say the least, as from blacksmith to entry-clerk in the various departments of a manufactory of sewing-machines. These trite facts are, of course, so perfectly familiar to all men of education, or of trained common sense, that their reiteration is in danger of becoming exceedingly wearisome; but we are obliged to remember that the average voter is not represented by the man of education or of trained common sense. The necessity of adaptation to any special trade or commercial pursuit is generally admitted, to a certain extent, even by the average unthinking voter; but the necessity of fitness for any public office he never seems to have taken into consideration. Any man is fit to hold and administer any office to which he can succeed in getting elected. Furthermore, we do not believe that any statement of facts can be made sufficiently forcible, or that any logic is sufficiently strong, to drive this unfortunate idea out of the mind of the ordinary voting citizen. Accustomed to regard an office as a prize or medal, to be gained very much in the same way as at a church fair the French clock is voted to the most popular clergyman, while the favorite doctor secures the piano, what wonder if a conception of the idea of official duties is obscured, or even never attained? No very peculiar fitness is needed to receive a gift. And therefore we find so often that in the thriving village, for instance, the favorite self-made manufacturer, who never read a line of history, is sent to Congress to help to make laws for a nation; while in city wards the most liberal giver of coal to the poor, or the contractor who employs the most workmen, or the keeper of the most popular saloon, takes the votes and the offices. It is evident, we think, to all who know something of the motives which guide the great majority of voters that the average American has no clear understanding, as yet, that there is any necessity for him to consider the question of fitness for required duties when he deposits his ballot for the man of his choice. To recur to our original illustration, it is certain that the majority of the people of Bridgeport do not recognize any incongruity between the functions of a showman and the functions of a chief-magistrate; yet even they, as we have already intimated, are probably much more excusable than many others whose actions might be here quoted, if necessary, in illustration.

Now, we fully believe that the most effective weapon with which to awaken the needed public feeling and combat the evils to which the lack of it gives birth, is a plentiful use of vigorous and good-natured humor—employing the word in a generic sense, to include everything akin to itself, from genial wit to caricature and satire. The point of a joke will enter many a brain that seems impervious to the point of an argument; the keen edge of witticism will cut where the clearest fact is too blunt to prove effective; and ridicule will open the eyes where logic fails. Mr. John Morrissey well knew the kind of argument best suited to his audience when he recently tried to ridicule the character of the appointments of Mayor Wickham, but the weapon is a dangerous one for him and his class to attempt to handle. It could be wielded with tenfold effect in the hands of their opponents, as was well shown during the warfare against the Ring in this city; people who could not read could easily understand the ridicule of pictures, and Nast's caricatures were potent where facts and arguments had always failed.

Our subject, which has been hinted at rather than treated, is capable of extended applications. Especially do we believe that the field for *Punch* in America is very much broader than this particular portion of it which we have pointed out. But we have space at present for only one other suggestion: mortifying as it is at times to see an important public office filled by a man who is thoroughly unfit in every particular for the position to which he has been chosen, and disheartening as is the reflection that this spectacle is an outcome of republican institutions, nevertheless all defects of this kind are, after all, among the minor evils of our political system. The matters of deepest importance have not been mentioned in this article. In connection with these last there is plenty of downright earnest work to be done, more than enough to create deep seriousness in him who perceives something of its extent and difficulty. It is well, therefore, to keep in reserve a wholesome antidote against cynicism and the blues, and to recognize one enemy at least who can be better attacked with the weapons of *Punch* than with statistics or a syllogism.

## ENGLAND.—THE WOMEN'S ENFRANCHISEMENT BILL.

LONDON, April 10, 1875.

IF any one had entered the House of Commons as I did on Wednesday afternoon, about five o'clock, and had heard the peroration to the speech of the late Attorney-General without knowing what the subject under discussion happened to be, he would have supposed that he had come in to witness the dying struggle of a strong administration, if not the falling effort of an extinguished empire. Sir Henry James owes his Parliamentary reputation principally to a speech which he made against the enfranchisement of women three years ago, and to a vigorous election contest which he fought and won at Taunton against the persistent hostility of the Woman's Disabilities League, which directed the whole of its influence against him, even to the length of sending two wild women to dog his footsteps during the whole of the election, when he vacated his seat on his appointment as Attorney-General in the autumn of 1873; it being, you will remember, a matter of election etiquette not to contest the seat of a Law officer when he receives his appointment as Attorney-General. On Wednesday, on the second reading of the bill for conferring the franchise upon women, Sir Henry wound up the debate, speaking from the first Opposition bench in the place usually occupied by the leader of the party—a position which helped the delusion that a great administration was about to receive its death-blow. The discussion had languished for several hours. Mr. Forsyth, who introduced the measure, had been dull, though his speech, carefully prepared and delivered with stately decorum, was evidently pleasing to the ladies in the cage above the Speaker's chair. Mr. Chaplin, a wealthy Lincolnshire squire, well known on the Turf, and not inexperienced in the ways of the wily sex, had moved the rejection of the bill, in a speech that was characterized as "splendid" by a succeeding speaker. Mr. Leatham, the Radical member for Huddersfield, who having lately acquired a landed property has very properly put on a coating of conservatism over his extreme views, seconded Mr. Chaplin's opposition, and made an effective speech full of neatly prepared impromptu sarcasms and sharply-turned epigrams. He was followed by Mr. Smollett, an elderly gentleman with a Scotch accent, who has wrecked a fair Parliamentary career on the sunken rock of his great-granduncle's reputation—Smollett the historian and

novelist. Mr. Smollett of our times has, unfortunately for himself, adopted much of the last-century coarseness of his distinguished relative's style, without one spark of his humor to set it off becomingly in the present day. The topic under discussion was congenial to his peculiar style of oratory, and he was careful not to pander to what no doubt seemed to him the prejudices of a prudish House; but, on the principle that a Smollett should call things by their Anglo-Saxon names, he gave free rein to his fancy and to a copious and straightforward vocabulary. The House did not like it, and for a moment was pleased to listen to a stern rebuke inflicted on him by Mr. Stansfeld, who has constituted himself the champion of the sex in all their worst vagaries, but in the end it experienced a feeling of revulsion at the latter gentleman's argument, and obviously voted in silence that the speech was a failure and the argument unsound. So far, with the exception of Mr. Chaplin's speech, the debate was poor. For three more hours it did not improve, but then Sir Henry James, with the intense passion of a man who had been pursued by harpies, rose at the table and delivered his mind upon the measure. He did not complain much of the bill itself, except that it would enfranchise wives as well as maidens; but he saw, "written in invisible ink" between the lines of the deftly-framed proposal, domestic strife in every family in the land, social revolution, imperial ruin, and all the other horrors which an eager imagination, heated by the persecution of many weird sisters working mischief in his constituency, conjured up to terrify the British nation. In his best dramatic style, and in imploring accents, he addressed first his own side of the House, and then the other, and finally the Speaker. He entreated the Liberals to refuse to pass a measure which would destroy their party, as all women, led by clergymen and doctors, would vote for Tory candidates. He entreated the Tories not to pass a measure that would uproot the constitution and overthrow all the cherished institutions of ages. He entreated the Speaker, who was there to moderate between the parties, to proclaim whether such a measure would not "endanger the happiness of the people and the greatness and stability of the empire." The words were brave; but, as it appeared, they were none too brave for the occasion. In the division, which immediately followed, the bill was thrown out by a small majority—only 35.

It seems a poor thing to come down from such flights as these to anything so commonplace as history, but I think it may not be uninteresting to trace the fate of this measure on the several occasions on which the House has expressed an opinion upon it. In 1870, a time when people's thoughts were occupied with Ireland and with education, the second reading of this bill was carried in a thin House by a small majority, no one believing that such an innovation was seriously intended; but on the motion of going into committee it was thrown out by a majority of 126, the number of votes being, ayes, 94; noes, 220.

In 1871, the ayes in favor of the second reading were 151; the noes, 220.

In 1872, the ayes in favor of the second reading were 143; the noes, 222.

In 1873, the ayes in favor of the second reading were 155; the noes, 222.

In 1874, no division—the bill withdrawn.

In 1875, the ayes in favor of the second reading were 152; the noes, 187.

It is curious to notice how closely the members correspond on either side each year, but it is somewhat remarkable to find that the supporters in the old Parliament and in the new are, numerically, almost identical. To the apparent falling off in the numbers of the opponents of the measure, I do not attach much importance. It may be that some who were under pledges to their constituents not to oppose the bill, determined to stay away from the division. But the real cause of the diminution in the numbers is due to an even more prosaic fact. Wednesday happened to be the day on which the Princess of Wales went down to Chatham to assist at the launch of the new iron-clad ship, called after her the *Alexandra*, and where Royalty goes, there the faithful Commons are pretty sure to follow. It probably did not occur to any of those who thus absented themselves that there was much danger of a second reading of a bill to create a social and political revolution being carried by a Tory Parliament, and in that belief they took a holiday. But, be the cause what it may, the small majority by which it has been lost has excited the promoters of the bill. They point with some elation to the fact that Mr. Disraeli, the head of the present Administration, and one member of his Cabinet, Lord John Manners, voted for the bill, and that Mr. Gladstone, the head of the last Administration, did not vote at all. But they discreetly draw a veil over the other fact that no less than twelve of the last Government, including Mr. Bright, Lord Hartington, and Mr. Lowe, and nine of the present, including Mr. Cross, Mr. Gathorne Hardy, and the two Tory whips, voted against them. Ignoring these not insignificant details, they look upon the passing of the bill at no distant future as a foregone conclusion, and they are already preparing to redouble their exertions to secure this still far-off social event in an early session of Parliament.

And from one, and that the logical, point of view, people seem fully well satisfied that they are not far wrong. If the occupation of a house and the payment of rates thereon constitute a qualification for the suffrage, and women do occupy houses and pay rates upon them, they ought not to be excluded from voting. "If John Brown," as one honorable member put it, "lives in No. 5 in any street and votes, why should Mary Smith, who lives under similar conditions in No. 6, be disqualified?" The logical answer to the question is not quite clear, but, as the Frenchman said when some one taxed him with a logical discrepancy in his views of the Franco-Prussian war, "on ne conte pas sur la logique dans la guerre." Politicians say you cannot legislate by logic to the subversion of expediency. If you, on mature reflection, are satisfied that the consistency of centuries should be overturned, and women should in all things be as men, then this measure may be passed. But, so soon as it is passed, those who have promoted it cannot cease from troubling until women sit in the House of Commons and in the House of Lords, as they now do on school-boards, and take an active part in the foreign and domestic legislation of the country. Neither can they draw the line at that point. If women enjoy the privileges of male citizenship, they must bear the burdens; and all the professions and trades, including the army, the navy, and the police, will demand their contingent from the hitherto protected sex. The stone once set rolling on the hilltop, as Sir Henry James so beautifully remarked, will not cease rolling till it reaches the valley. And if the bill passes, the defenders of expediency urge, the thin end of the wedge (to use their favorite metaphor) is inserted into our domestic, social, and imperial institutions, and it will be driven through until the gap is made irreparable.

I confess to a stolid sympathy with the advocates of expediency, and, though I never was dogged for days and nights by two women during an election contest, I cannot help feeling some dread of this social and domestic carpentering. It was only the other day that the principal and the professors in the University of Edinburgh experienced to the full some of the horrors pictured by the late Attorney-General by neglecting the precautions which the House of Commons were entreated to take at the outset of this new crusade. These learned gentlemen, some years ago—the year, as I remember by a *bon-mot* of his upon the subject, that Prévost-Paradol visited Edinburgh before he went to you—made arrangements whereby ladies who had a turn for nursing might obtain some instruction in the medical school in their University. In their case, even more than in that of Mr. Forsyth,

> "These good men little knew
> What the wily sex could do."

Six or seven ladies presented themselves, and were duly admitted to a limited attendance at the University. The arrangement worked well for a short time. But the ladies were not satisfied with limitations. They requested first one extension and then another, until their full demands were tabled, and amounted to all the privileges of male medical students, attendance with male students at the professors' lectures and University medical degrees. The authorities saw too late the fatal result of the admission of the thin end of the wedge, and it was only by a protracted litigation in the Scotch law courts, and, if I am not mistaken, in the House of Lords on appeal, that the matter was settled by the exclusion of the ladies by judicial decision. Such institutions as Girthon College, near Cambridge, where ladies have the advantage of professorial and tutorial assistance in their studies in their own class-rooms, and without the intermixture of male students, may be commended. A Royal Commission on Scotch Endowments, which has just issued its report, has recommended that an institution similar to Girthon should be established in Edinburgh, and supported out of misapplied endowments, and that, no doubt, is a reasonable recommendation. But such institutions and proposals are very different from the institution which the medical ladies desired to establish in the University of Edinburgh, and very different from the proposals of Mr. Forsyth and Mr. Stansfeld, which have so upset the equilibrium of the late Attorney-General.

## AUSTRALIAN POLITICS.

MELBOURNE, Feb. 1.

THE first session of the Eighth Parliament of Victoria has just closed, and all parties agree in denouncing it as a failure. "The performances of the Victoria Parliamentary Theatre have been one long-continued outrage on public taste and public intelligence," says the conservative *Argus*. "The

session has been one of the most barren and least satisfactory since the introduction of the constitution," says the liberal and ministerial *Age*. When I add that the one measure passed which excited any real interest in Parliament was an act to continue the payment of members, you will probably judge us more hardly than we deserve. Our public men are pretty fair representatives of the community; self-seeking, but not generally corrupt; factious at times, but also capable of public spirit, and failing just now to accomplish anything only because they have no very definite views and no competent leader. Perhaps it may be added that we are too prosperous at present to concern ourselves very seriously with questions of reform. Like true Englishmen, we regard a statesman who looks five years ahead as "unpractical," and prefer to put off repairing our house till the walls crack. Nevertheless, we are not indisposed to take up a speculative question from time to time; and the present session has been more interesting from the failure of two measures, which will serve to show whither we are drifting, than from its insignificant achievements in tinkering local acts or authorizing public works.

The most ambitious of our failures was an attempt to reform our constitution. Like most British colonies, we possess two Houses of Parliament, and are more or less embarrassed to know what to do with one of them. It is part of our political creed that the Legislative Assembly corresponds to the House of Commons in power and dignity, but we hold quite as strongly that the Legislative Council is not a House of Peers or even an Upper House. In a country where we have no history, no established church, and no aristocracy, where titles are rather laughed at, and any assumption of rank positively disliked, public opinion will not tolerate the institution of a counterfeit peerage. But then, again, our Council has no resemblance to the American Senate. The whole area of Victoria is about equal to that of Great Britain; and not even a stump-orator can affect to regard it as a federation of counties. Some philosophical conservatives hold that the Council represents the critical or deliberative element, and that its function is to prevent indiscreet legislation. Unluckily, it is notorious that no man good enough to get a seat in the Assembly will accept one in the Council; and it seems peculiar to entrust our second-rate men with a veto upon the measures of our ablest. The truer theory, I believe, is that the Council represents a single interest, that of property, and a single class, that of employers. It is elected by a limited constituency of electors, with a high qualification; its members are either moneyed men or possess the confidence of the moneyed class; and it never fails to veto any measure that appears to touch existing rights or to threaten uneven taxation. Having this single view before it, it is much more unanimous than the Assembly; and as its members are elected for ten years, they can defy public opinion. It has once produced a dead-lock in the colony by refusing to pass the supplies. It constantly rejects measures which the public and the Assembly are agreed in desiring. Our premier, in the early part of the year, Mr. Francis, pledged himself to appeal to the country on a measure for reforming the constitution, which should diminish the Council's power to obstruct. He proposed that where a measure passed by the Assembly in two consecutive sessions had been twice vetoed in the Council, the two Houses should vote upon it in conference. This, or something like it, as I need hardly tell your readers, was practised in Scotland, and is the plan adopted in Austria, in Würtemberg, in Hesse-Cassel, in Norway, and, to a certain extent, in Sweden and in Switzerland. But Mr. Francis, his advisers, and his opponents, knew only of the Norwegian precedent; and for some weeks, till the public mind had been enlightened by discussion, there was a perfect outburst of conservative indignation at "the Norwegian fad." It really seemed as if the argument, "it is not English," would be conclusive. But the good sense of the great constituencies triumphed, and a House was finally returned in which Mr. Francis appeared to be absolute. The second reading was carried by an overwhelming majority. At the third reading an honorable and able, but most impracticable Radical, Mr. Higinbotham, headed a secession, on the ground that the Assembly was parting with too much of its power. The unwilling supporters of the bill instantly ratted, and the Government majority dwindled down to two. At this critical moment Mr. Francis, on whom all depended, fell dangerously ill. A new Ministry was formed, and the bill has been withdrawn for the year. It is to be introduced again next session, but there is little hope that the Ministers, who are now in on sufferance, will be allowed to pass any measure of importance. The discussion, however, has had its use. It has shown that our people are stubbornly and not stolidly British. They have not the Yankee readiness to give a new thing a trial because it is new, but they will not absolutely condemn it because it is not old. They went with Mr. Francis sufficiently to make him all-powerful in the Assembly, but I do not think they would have supported him in a protracted quarrel with the Council. They are more likely to sweep it away altogether in some time of popular excitement. They cannot be very enthusiastic about patching up what is radically bad.

Meanwhile, the Council has profited by its reprieve to veto a measure which is loudly demanded in the country, which is supported by all influential newspapers, and which the Assembly passed in a week, almost without discussion. The Bill for Mining on Private Property is no new measure, and deals with a very flagrant want. In all transfers of public land in this colony the Crown has invariably reserved the "royal" metals of gold and silver. Nothing is more certain, therefore, than that a man does not own the gold on his own property. But the Crown has forgotten to reserve the right of search, and the consequence is that great tracts of auriferous land are now locked up. The question becomes more and more important every year. In the first place, our actual gold-fields show signs of exhaustion, and several thousand miners are said to be out of work. In the next place, pending the enactment of some general measure, all lands supposed to be auriferous are being withheld from agricultural settlement. The bill passed this year by the Assembly allowed the Governor to grant leases for mining on private property. If the persons applying are not themselves the owners of the land, they were to make compensation to the owners, and the leases were to be forfeited if the mines were not honestly worked. Such a measure does not, I think, seem very revolutionary, though it undoubtedly assumes that the State will not allow any man to withhold from public use what he does not use himself. But out of thirty members of Council, Government could only bring together seven to vote for this measure. Its opponents throughout took the line that owners of land were entitled to sell the gold which had never been conveyed to them; in other words, that mining rights cannot be reserved in a sale of land. Views so discordant can hardly be reconciled, and as the bill will certainly not be let drop, its further discussion will probably lead to fresh complications between the Council and the Assembly.

You will see from what I have said of the Mining on Private Property Bill that we have been forced into some broader speculations than are currently accepted in England. I feel certain that in England an attempt to enforce the rights of the Crown by granting licenses to mine for gold on private property would be regarded as grossly oppressive. Here the opposition to the bill has absolutely no strength, it may almost be said no existence, outside the Legislative Council. There is another respect in which we are likely, before long, to be forced into an un-English current of thought: I mean as regards our land laws. For some years past we have been legislating with the view to creating a class of yeoman-farmers. In this colony we have failed signally, for reasons which I hope to explain in a subsequent letter; and it seems likely that we shall soon pass laws to prevent the accumulation of large properties in the hands of individuals. Otherwise—so great has been the accumulation of wealth—we have every chance of seeing four-fifths of the colony divided between the immediate descendants of three or four hundred persons.

I have only to add that at present our prosperity is something wonderful. We defy all economical laws by protective tariffs and inconsistent land legislation, and the revenue shows no sign of decrease. Here and there a particular industry, like the mining, falls a little behind; but its deficiencies are more than compensated by the good seasons of the last three or four years, which have given us heavy clips of wool and abundant harvests. Altogether, the public revenue is about four millions, or at the rate of five pounds ($25) a head. Of this we spend about a fifth (£800,000) on a state system of secular education. But then the interest on our debt is almost paid by the receipts from our public works, and our army and navy are only in embryo.

## THE "ARMSTRONG" GUN.

To the Editor of The Nation:

Sir: Allow me to call attention to a very grave omission in Appleton's 'Cyclopædia,' which ought either to be corrected or explained at once. In the articles "Artillery" and "Cannon," the former by Colonel H. A. Du Pont, U.S.A., the latter by General James Harrison Wilson, the guns of Armstrong, Frazer, Blakely, Krupp, and others are fully and minutely described But the inventor of this modern gun which is revolutionizing the heavy artillery of the world, is not even mentioned by name, although the inventor was an American. In the year 1844, Daniel Treadwell, professor in Harvard University, devised the whole modern process of gun

manufacture, now adopted in Prussia and England, and made guns with astonishing success. If Treadwell's skill in lobbying and reasoning with incompetent officials and military commissions had only been equal to his science, his gun would have been at once adopted by the United States Government. In England, as soon as the Treadwell patent expired, the invention was eagerly seized on, and the Treadwell guns are now made there under the name of the "Armstrong" gun. The so-called "Armstrong" gun is the Treadwell gun in every particular, with the single exception of the substitution of the steam-hammer in the manufacture for the hydrostatic press—a change of doubtful value. It cannot be supposed that the omission of Treadwell's name, and of a full and just recognition of his services, is due to ignorance, as the gun is mentioned in earlier editions of the 'Cyclopædia;' and if, as appears probable, it is not an omission, but a suppression, and the suppression is due to boyish prejudices about *péquin*, and a reluctance to admit that the most formidable engine of war ever devised was entirely conceived and perfected, and successfully manufactured, by a civilian and a professor in a college, then the sooner the articles in question are rewritten, the better. Nothing short of a full and explicit statement of Treadwell's whole invention, *with dates*, can make amends for the injustice done him.

Very respectfully yours, N. N.

New York, April 22, 1875.

## THE NATURAL HISTORY OF THE LOBBY.

To the Editor of The Nation:

Sir: Having passed the winter in Cambridge, and been brought more or less in contact with the young men there, I was much struck with the extent to which the *Nation* is read and referred to. An influence of this sort involves some responsibility. The scantiness of the sources of information from anything beyond a partisan and temporary point of view, as to the working of our Government, is such as to make instruction in comparative politics one of the most apparent wants in our collegiate education.

Your article upon "The Supreme Court on the Lobby," valuable as it is, seems to me to admit of further analysis. Why is it that a claim like that of Mr. Trist, supposed to be just, is pressed upon Congress year after year without receiving any attention? And why is it, again, that a professional lobby has grown up as the only means of getting anything through Congress? Why has a just claim no chance without the lobby, and any claim, just or unjust, a very good chance if the lobby is properly handled? The first reason seems to me to be the entire absence of personal and public responsibility. If a just claim were neglected in England, some member would address a personal enquiry to a Cabinet Minister, and the Opposition, whose function it is to enforce just such criticisms, would insist upon a satisfactory explanation. But you cannot cross-question a majority, because it will not reply. It is notorious that men will do and leave undone in a body what they will not singly. There is with us no Opposition, because there is nobody for it to act upon. Another reason is the necessity, in the absence of any guiding authority over the vast mass of business brought before Congress, of the reference of all business to standing committees. As these committees do their work outside, and from impulses of which the public can have no knowledge, the lobby, whether for good or evil, is a necessity. It is the only means of conducting business with committees, whether by a private person pursuing a claim, or by the Secretary of the Treasury with a plan for a return to specie payments. Add the fact, that every measure must be got through both Houses, not by responsible leadership, but, as it were, by a haphazard crystallization of majorities, and the necessity of the lobby as an institution becomes apparent. Finally, special legislation, whether in Congress or the States, is a natural result of employing only special legislators. The nation is not represented in Congress The members who form all the working committees are local representatives. Will they not, as a matter of course, give their attention to local wants?

There is but one reason why we should not have responsible ministers guiding, though not controlling legislation, securing publicity of debate, and strict accountability not only for themselves but for the majority of the individual members of Congress. That reason is the interest of the lobby, a power which is just as determined and just as able to prevent publicity, responsibility, coherence of legislation, national as against special laws, in short, honest and good government of any kind, as it is to bar or promote any claim which it may choose. So long as the people choose to be governed by standing committees they must make up their minds to a virtual government by the lobby. When they are sufficiently tired of the lobby, they must insist that the executive branch, the object of the national election, shall have the powers requisite for carrying on the Government, subject to responsibility to Congress and the country, which will then first begin to be duly enforced. G. B.

Boston, April 24, 1875.

## ENGLISH VOCABULARIES.

To the Editor of The Nation:

Sir: Will you allow me to add a word of explanation to a paragraph in the *Nation* of February 25 with regard to the number of words in the vocabulary of a person of fair intelligence? This paragraph was a brief mention of a paper in which I expressly defined a *word* to be (for my purpose) "a symbol occurring in capital letters in the main body of Webster's Dictionary, edition of 1852." I should feel great diffidence in criticising any results reached by so eminent a scholar as Professor Marsh, and this definition of a word shows that my count of the words in common use agrees substantially with his own estimates as explained in the *Nation* of April 22. I think I may say, however, that Professor Marsh's meaning is not so perfectly clear in his 'Lectures on the English Language,' pp. 181–2, as it is made in his note to the *Nation*, for it has not only misled me, who have no particular knowledge on the subject, but also a distinguished philologist whom I consulted in regard to it.

It may perhaps be proper to add, in regard to my estimate of the number of words in a vocabulary of average size (30,000 words), that Webster does not give "*love, lovest, loves, loved, lovedst*, and *loving* as *six* words, but as *three*, viz., *love* (noun), *love* (verb), and *loving* (adjective), and I counted these as three.

My object was to get a practical idea of the number of words, in the sense in which I used the term, which are in common use, and I counted *lover, loveless*, and *lovely* as three words, although they have the same "simple or stem."

With regard to the vocabularies of Milton and Shakspere the same rule was followed, my object not being to compare the number of stem-words which they used with the number in common use, but the number of signs for ideas, whether derivative or not.

Edward S. Holden.

Washington, April 24, 1875.

# Notes.

Noyes, Holmes & Co., Boston, will shortly issue 'Piano and Song; How to Teach; How to Learn; and How to Form a Judgment of Musical Performances'—a series of papers by the late Friedrich Wieck, the father of Frau Dr. Clara Schumann and instructor of herself and her husband, the famous composer. The translation has been made by an American lady.——Mr. John Harper, the senior member of the firm of Harper & Bros., and one of the four brothers of the earlier firm, of whom but one survives, died in this city last week.——The Systematic Beneficence Society of Birmingham, Conn., offers through its secretary, Mr. Geo. W. Shelton, a prize of one hundred dollars for the best tract ("that shall be judged satisfactory") on giving a percentage of one's annual income for charity. The essays must reach the Secretary by July 1.——We are glad to notice a third and revised pocket-edition of Prof. J. D. Whitney's 'Yosemite Guide-Book' (New York: B. Westermann & Co.), very compact and elegantly printed. A fourth map has now been added to those of the editions of 1869, 1872, namely, of the Hetch-Hetchy Valley, which is described for the first time in this work. This cañon of the Tuolumne is about twelve miles north of that of the Merced, and is well worth visiting, though as yet rather difficult of access. "It is," says Prof. Whitney, "grand and interesting, but not to be compared with the Yosemite." However, it would appear wonderful anywhere but in California.——A third revised and enlarged edition of Lippincott's 'Philadelphia and its Environs' is also before us. It is profusely illustrated, and, we need not say, handsomely printed. In the chapter "Relics of the Past" we find no mention of a very respectable, if humble and secluded relic—the Friends' Alms-house. The architectural appearance of the city is undergoing a marked change; perhaps, on the whole, for the better.——In Bulletin No. 33 of the Boston Public Library, the patrons of that institution are treated to the bibliography of Lexington, Concord, and Bunker Hill, and two pages are occupied with an analytic account of works on costume. As usual, these lists refer to works in the Library, but are serviceable anywhere.——The most readable article in the *China Review* for November and December is that on "Chinese Proverbs and their Lessons," by Mr. Alfred Lister; and the most noticeable

passage in it is that which asserts, with illustrations, that "the Chinese have abundant proverbs implying not only a belief in God, but also a humble trust in him." The existence of this belief has been denied, because "the Chinese name for God is also, as it has been in almost every nation, the name of the sky."——A correspondent writes us: "Let me call your attention to Henri Mürger's 'Scènes de la vie de Bohème' (ed. Mich. Levy, p. 28). You will find that what you call 'one of the latest stories circulated illustrative of the political condition of France' (April 1, p. 215), is simply a fragment of one of Murger's *bons-mots* put into the mouth of *Marcel*, the artist, as early as 1850. It has suffered frequently at the hands of plagiarists, but has never before, I believe, been travestied by a newspaper so well entitled to respect for its cultivated tone as the *Nation*."

—Our readers have been kept informed of the progress of the 'Statistical Atlas of the United States,' under the direction of Gen. Francis A. Walker, late Superintendent of the Census. We are now able to announce that the letterpress is completed, thus finishing the work. The five thousand copies authorized by Congress in 1873 will soon find their way among the public libraries, learned societies, academies, etc., etc., which may be selected by the Secretary of the Interior in his distribution of them. Under a proper system of disposing of Government publications at a fair price, this Atlas would be made procurable by the public at large; as it is, it can become the private possession of but a few. The want of time and money has frustrated the intention of providing every map or group of maps with a commentary, but there is still a goodly number of papers, which we shall attempt briefly to indicate. Gen. Walker himself furnishes the Introduction, and also the concluding article on the "Relations of Race and Nativity to Mortality in the United States." The latter has already been published in substance in the transactions of the American Public Health Association, as a paper read before that body. It deals with an admittedly abstruse and difficult question, but reaches probable if not positive conclusions of great interest. Prof. J. D. Whitney's paper on the "Physical Features of the United States" is clear and untechnical enough to find a place in any text-book on American history. More technical is the explanation of the Geological Map of the United States, by Chas. H. Hitchcock and Wm. P. Blake, to which is appended a very valuable list of geological maps and publications. Prof. R. W. Raymond describes, in a readable manner, but briefly, and with a liberal quotation from one of his own reports as Commissioner of Mining Statistics, the gold and silver mines of the West. Prof. Hitchcock, again, discusses the coal measures of the United States, divided into the New England basin, the anthracite basins of Pennsylvania, the Appalachian coal-field, the Michigan, Illinois, and Missouri basins, and the Texas coal-field. Mr. S. W. Stocking, of the United States Patent Office, gives a full explanation of his valuable map of the areas and political divisions of the United States; with text and map together, one can construct the map of the United States at any given date. Two elaborate tables accompany this paper. Mr. E. B. Elliott, of the United States Bureau of Statistics, a writer of acknowledged authority, contributes an "Approximate Life-Table for the United States on the basis of the Census of 1870."

—Two other papers remain to be mentioned as having a special interest. One, by Professor William H. Brewer, is on "The Woodlands and the Forest Systems of the United States"; the other, by Mr. S. A. Galpin, on "The Minor Political Divisions of the United States." The extent of woodland in the country can only be estimated. On the maps of the Land Office, remarks Professor Brewer, "much more care has been shown in locating the mineral districts than the woodlands." This is not surprising when we consider that immigrants have naturally avoided the wooded States, like Indiana, in favor of territory that required no clearing, and that the mining regions offer as an attraction for colonists neither timber nor arable land. For rapid and widespread settlement the policy of the Land Office was well adapted, and such settlement had a vital (though unforeseen and uncalculated) bearing on the perpetuity of the Union as against slavery and secession. Professor Brewer's view of the gain and loss in woodland is on the whole encouraging. Its area is very slowly if at all diminishing in New England, and the same may be said of the Southeastern and Southwestern States, where the prime trees are taken out, but the other growth not disturbed. In the Middle States there is a rapid falling-off, without compensation, in area and value, and the greatest consumption of all in the Northwest. As an illustration of the treelessness of certain virgin districts, Professor Brewer says that "it is possible to cross the continent from the Pacific to the Gulf of Mexico without passing through a forest five miles in extent, or large enough to be indicated on the map." The main distinction of growths is broad-leaved, hard-wood trees for the eastern half of the continent, and coniferæ for the western half. "Neither beech, nor elm, nor hickory, nor mulberry, nor basswood, nor tulip-tree, nor magnolia, nor sassafras forms an element in the forests of the Rocky Mountains and westward." We do not remember to have read before of the redwood that, when cut, a new growth sprouts from the stump, "which is not true of any other timber-tree belonging to the coniferæ." A eucalyptus felled at Sonoma, Cal., in 1874, at the age of nine years, was ninety-six feet high and eighteen inches in diameter at four feet from the ground. Mr. Galpin's subject is novel, and susceptible of much more extended treatment than was possible in the Atlas. He compares and illustrates the town system of self-government, which exists in its purity only in New England; the county system, characteristic of the South; and the compromise system, prevalent in the Middle States. He quotes a letter from Jefferson, in which that statesman praises the New England system for the facility which it affords of rapid and concerted action, saying that it enabled those colonies to resist British oppression more promptly than the clumsy communities to the south of them, and later, as States, to effect the repeal of the embargo, in opposition to the wishes of the larger half of the Union. This would have afforded a good text for orators at the Concord Centennial. It may be doubted if the town-meeting system was practicable in a community essentially slaveholding, and therefore essentially agricultural and sparsely populated, and, of course, essentially oligarchical.

—The National Academy of Sciences has just concluded its April meeting in Washington, which was held at the Smithsonian Institution, under the presidency of Professor Henry. The attendance was not large, either of members or of the public, but a respectable number of papers were read, of which a very full report has been given by the *Tribune*. Of the more strictly scientific papers, that of Professor Loomis, of Yale College, on the results to be reached from a discussion of the signal-service maps, and Professor Langley's account of solar phenomena observed at Alleghany Observatory, were of most general interest; while President Barnard's Report for the Committee on Weights, Measures, and Coinage, and Mr. Justice Bradley's (of the Supreme Court) proposal for a reform of the Gregorian Calendar, referred most directly to practical questions. The reform of the calendar has been somewhat fully discussed lately, and a bill setting forth that "the Gregorian year pays no proper respect to the cardinal points in the earth's orbit," and proposing to secure such respect, was laid before the House of Representatives at its last session. Mr. Justice Bradley's plan proposes to fix the beginning of the year at the winter solstice (Dec. 21), and to divide it into four unequal parts of 90, 93, 93, and 89 days; in leap-years the last part is to have 90 days. In the remarks on this paper, a much better plan was mentioned, which had been previously discussed by the Philosophical Society of Washington. This was to begin the year with December 21, but to divide it into six parts of two months each, each part to have 61 days in leap-years, and the last part to have but 60 days in common years. The scheme would be somewhat as follows for a common year of both systems:

| | Jan. | Feb. | Mar. | Apr. | May. | June. | July. | Aug. | Sept. | Oct. | Nov. | Dec. |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Gregorian.. | 31, | 28, | 31, | 30, | 31, | 30, | 31, | 31, | 30, | 31, | 30, | 31. |
| Ideal..... | 31, | 30; | 31, | 30; | 31, | 30; | 31, | 30; | 30, | 31; | 30, | 30. |

Thus only February, August, and December would be altered by this ingenious plan, which is due to Mr. E. B. Elliott, the statistician. Papers by Professors Alex. Agassiz, Gill, Marsh, and Newberry, on zoölogical topics; by Professors Newcomb and Davidson, on astronomy; and by Professors Guyot and Lesley, on geology and physical geography, were also read. The communication of Professor Marsh was on the "Progressive Increase in Size of the Brain in Fossil Mammals." Briefly, they were to the effect that in the earlier mammals the brain was much smaller than in the later ones, and that there had been a progressive increase in the size of it—in other words, that the brain as a whole has developed much more than in ratio to the size of the animal, and that the cerebrum has also grown much more in proportion than the cerebellum. This theorem was illustrated by reference to the development of the brain in the several successive members of the chief groups of Ungulates, as well as in groups of the orders of Primates, Carnivores, Insectivores, and Rodents. Professor Lesley reported on the progress of the recently-instituted Geological Survey of Pennsylvania. Provision had been made for three years only, and the Survey had to be organized to correspond. It appears that three cardinal points have been selected from which to work, viz., Easton, York, and on the Juniata. Such obstacles are opposed in the coal and oil districts as to render efficient examinations of these almost impracticable. One of the principal and most unexpected results thus far developed is the ascertainment of the comparatively small vertical thickness of the lower limestones in the Reading district. These had been previously reported to be 10,000 to 12,000 feet in

vertical extension, but now turn out to be only about 2,000 to 3,000 feet thick. The Academy re-elected Professor Robert E. Rogers (chemist), and chose Professor A. Hall, U.S.N. (astronomer), Professor Alpheus Hyatt (naturalist), Professor Joseph Le Conte (geologist), and Mr. Lewis H. Morgan (ethnologist), as new members.

—The general index to the *Revue des Deux Mondes* ('Table Générale—1831–1874') has at last been published. It makes a volume of 477 pages, of the familiar size and type of the *Revue* itself (New York: F. W. Christern). In a modest but self-appreciative introduction the history of this periodical is traced from its commencement "in that great intellectual movement which set in towards the close of the Restoration, and expanded with so much éclat immediately after the Revolution of July." Intimately associated as it was with the new constitutional Government, the *Revue* did not concern itself with politics till 1833. The Revolution of 1848 and the establishment of the Empire caused, and we suppose we may say compelled, it ("par suite des restrictions légales") to give less exclusive attention to the affairs of France, and more to those of other countries—to justify, more than it had hitherto done, its world-embracing title. It is with sadness that the conductors of the *Revue* have to confess that twenty years of deliberate endeavor to enlighten the leading minds of France in regard to foreign nations, and particularly (after Sadowa) the great neighboring nation, failed to arouse the country from its vanity of self-contemplation and that overweening confidence in its own strength which was so rudely shaken in 1870. "Frightful disasters were the price of our illusions and defects," and the lesson still holds: "France will never know herself well except on condition of her knowing foreign countries better than she has hitherto done." Seven hundred and fifty writers, and these nearly all Frenchmen, figure in the 'Table Générale' as contributors to the *Revue*. They are given in Part I. in alphabetical order, their contributions being classified and then arranged chronologically. In this way one easily discovers the first connection of each with the *Revue*, the period of his greatest activity, and his latest appearance down to 1874. Part II. is analytical, of subjects discussed; Part III. is geographical, for an example of which take *England*, whose subheadings are: Literary and political history; legislation and administration; political economy; agriculture, sylviculture, and sport; industry; commerce; finances; public works, and railroads; colonies; army; marine; voyages, and ethnography; poetry; novels; drama; fine arts; religions; philosophy and morals; sciences; public instruction—in all, ten pages of the Index. The Old World occupies in this division nearly forty-four pages; the New World but eight, one-half of which are devoted to the United States, leading off, as it happens (shall we say prophetically?), with an article on Canada. Travellers in this country, among whom MM. Michel Chevalier, De Tocqueville, Duvergier de Hauranne, J. J. Ampère, and Auguste Laugel are the best known, furnish most of the writings about the United States. The only American names among the contributors are (by virtue of translation) Fenimore Cooper, in a letter to Lafayette on public expenditures, T. B. Aldrich, Bret Harte, and Edward Eggleston. Mr. George Walker, we imagine, needed no translator in writing on the American finances since the civil war. The only British names we have recognized in the list are Allan Cunningham, Wilkie Collins, and "Ouida." Half a dozen other writers would, we think, complete the list of the non-French. Among these Signor Bonghi, K. Hillebrand, and Vámbéry may have used the French as an original medium.

—A few weeks ago we mentioned the proposed printing of Sainte-Pelaye's 'Glossary of the French Language from its Origin to the Time of Louis XIV.' Some account of the author and his inedited works may not be uninteresting to our readers. Jean-Baptiste de la Curne (the name Sainte-Pelaye was given him to distinguish him from his twin brother) was born at Auxerre in 1697, of an illustrious family. His health was very delicate, and he was carefully kept from study until quite late, not beginning Greek and Latin until he was fifteen. He evinced, however, a wonderful quickness in all he undertook and was received into the Académie des Inscriptions when he was only twenty-seven years old. He was for a time diverted from literature by diplomacy, but soon gave up a brilliant career to return to his studies. He first became interested in Plutarch, but relinquished this author for the early history of France. His labors in this field led him naturally into mediæval literature and an examination of the romances of chivalry. In the prosecution of his work he undertook several journeys to Italy, and made extensive collections of manuscripts and extracts. He finally settled down on two great works: a Dictionary of French antiquities, and a Glossary of Old French. His materials for the latter filled forty quarto volumes, and he had issued a prospectus of the work in 1756, when a friend called his attention to the fact that the Glossary was not historical—*i.e.*, took no account of the various phases through which a word passed as to form and meaning. Sainte-Pelaye recognized the justice of the criticism, and did not hesitate to recommence his work, which he completed in sixty-one quarto volumes (MS.), and this it is which is to be published under the editorship of MM. H. Champion, L. Lavre, and Pajot. Sainte-Pelaye was admitted into the French Academy in 1758, and was a member of the *della Crusca*, and other learned societies. He died in 1781, shortly after his brother, between whom and himself there existed the most ardent and touching affection.

—His only important printed work is: 'Mémoires sur l'ancienne chivalrie, considérée comme un établissement politique et militaire' (Paris, 1759–1781. 3 vols. 12mo). His notes and extracts on Provençal literature he turned over to the Abbé Millot, who produced from them his very unsatisfactory 'Histoire Littéraire des Troubadours' (Paris, 1802. 3 vols. 12mo). Sainte-Pelaye's MSS. have, however, been preserved in the National Library and the library of the Arsenal, and some idea of their author's astounding industry may be formed when we say that the first-named library possesses three hundred and thirty-six, and the second over one hundred folio and quarto manuscript volumes. These contain copies, extracts, and notices of MSS. of all kinds, lists of names and subjects, and special and general glossaries. The real work of this enormous collection was done by Sainte-Pelaye himself. His coadjutors for the most part only copied; he then compared the copies again with the original, and explained in the margin the difficult words and passages in the text. These explanations were then copied on separate slips and pasted, in alphabetical order, in folio volumes. Sometimes he himself wrote out difficult passages when the other copies did not seem to him exact enough. It is melancholy to think how little credit this laborious scholar has hitherto received, his greatest work having reposed unprinted in libraries, a precious spoil for literary adventurers and ungrateful scholars who have borrowed from its treasuries without acknowledgment. Roquefort, for instance, in his 'Glossaire de la Langue romane' (Paris, 1808. 2 vols. 8vo), took his material almost bodily from Sainte-Pelaye's MSS. without a word of acknowledgment, and had the impudence to put on the title-page 'd'après les manuscrits de la bibliothèque impériale.' More recently, Littré has drawn abundantly from Sainte-Pelaye, as has also Godefroy, the latest lexicographer of Old French, whose work has not yet seen the light, owing to the downfall of the Empire. Nor is it merely for Old French that the Sainte-Pelaye MSS. are so important; he collected a vast amount of material relating to Provençal. Indeed, with access to his collection and the Paris MSS. a student in this department has almost the entire Provençal lyrical literature at his command, without going outside of the National and Arsenal libraries. In the latter are preserved the notices and extracts from the Italian Troubadour MSS., and an extensive index to all the MSS. used by Sainte-Pelaye. He enjoyed unusual facilities for gathering his materials, a Papal brief throwing open to him that most inaccessible of all libraries, the Vatican; and many MSS. are now only known by his descriptions and extracts. In publishing his Glossary, the French people are but doing a tardy act of justice to one of their most laborious and profound if least-known scholars.

—To what an extent the study of Icelandic is carried in the schools of Europe is shown by the lecture-lists of the German universities for the recently-terminated winter semester. While ten universities announced lectures on Old High-German, and nine on Anglo-Saxon, no fewer than eleven maintained courses on Icelandic literature. The lecturers were Möbius at Kiel, Müllenhoff (Berlin), Hildebrand (Halle), Wilken (Göttingen), Kölbing (Breslau), Weigand (Giessen), Bergmann (Strassburg), Ettmüller (Zurich), Zupitza (Vienna), Schönbach (Gratz), and Hofmann (Munich). All this is in addition to the lectures of Dr. Konrad Maurer at Munich on Icelandic law, and those of Professor Birlinger at Bonn on Icelandic philology. Some of these names, like those of Maurer and Möbius, are already familiar to the readers of the *Nation*. Of the others, Ettmüller has published an Icelandic chrestomathy and an 'Altnordischer Sagenschatz'; Bergmann is the author of several volumes of commentary, in French, on the so-called elder Edda; while Zupitza has communicated many articles on Icelandic matters to the *Zeitschrift für deutsche Philologie* and other periodicals. Eugen Kölbing, the youngest of these scholars, who was lately appointed to the chair of Icelandic at Breslau, issued last year an admirably-edited volume containing early Icelandic versions of four of the Arthurian legends—the Parcevals saga, the Valvertháttr, the Ívents saga, and the Mírmans saga—under the general title of 'Riddarasögur.' That portion of the old Northern literature which embraces the tales of chivalry is an almost unworked field, scores of manuscript sagas of this class still lying on the shelves of Scandinavian libraries awaiting a proper editor. These Icelandic

translations sometimes throw light upon obscure words and passages in the existing texts of the Old French or other originals. In this respect, they possess a general literary interest even greater than that which attaches to the sagas of native growth ; and Professor Kölbing's redaction is to be welcomed on this account as well as for its peculiar value to students of Icelandic.

—Besides that of Kölbing, the past year has brought prominently into notice another new name in the domain of Icelandic scholarship. Dr. Gustaf Cederschjöld of Lund—Sweden's second university—has given to the public, within a few months of each other, two works of special interest. The first reproduces the best and oldest text of the Bandamanna saga, a text hitherto inedited, the two previous editions of the saga (Holar, 1756, and Copenhagen, 1850) having been based upon a later and, on the whole, inferior manuscript. The scene of this saga lies in the northwest of Iceland, and its incidents—the date of which may be placed in the earliest years of the eleventh century—are connected with those of the more famous Grettis saga. It furnishes a curious picture of the formalities of ancient Icelandic jurisprudence, being in fact the story of a noted lawsuit. The other work is a critical edition of the 'Geisli' or 'Olafsdrápa,' a poem of the twelfth century. Its author, Einar Skúlason, an Icelandic skald, composed it in honor of St. Olaf, king of Norway, at the request of King Eystein, a descendant of the canonized monarch. It is the oldest of what may be styled the Christian lays of the later skalds. It was publicly recited in the cathedral of Trondhjem, between the years 1152 and 1155, in the presence of King Eystein and the other royal sons of Harald Gilli, the Archbishop of Norway, and a crowd of lesser dignitaries. It has even been surmised, from one somewhat obscure passage, that among the audience was Nicholas Breakspeare, then Cardinal-archbishop of Albano, but subsequently known as Pope Adrian IV., who was sent to Norway in 1152, in order to institute, as Papal legate, the archiepiscopal see of Trondhjem. The Icelander's poetical eulogy, pronounced before an assemblage so brilliant, was loudly applauded ; even St. Olaf himself is said to have expressed his gratification by emitting from his shrine what the saga calls "a precious odor," which filled the edifice. Produced under such circumstances, it is not strange that the 'Geisli' came to rank as one of the most renowned of the skaldic lays. Dr. Cederschjöld has followed the text of the manuscript in the Royal Library of Stockholm, which has been little used, and has accompanied it with a valuable introduction, careful syntactical notes, and accurate lists of the poetical paraphrases.

## WHITNEY'S LINGUISTIC STUDIES.*

OUR scholars will be glad to see a second volume of Professor Whitney's 'Oriental and Linguistic Studies,' and to learn that the first was well received by the general public ; it speaks well for the general public. The first volume was much taken up with views of the origin and nature of language and of the science of language, and it was in great part polemic. The subjects of this volume are not so imposing, nor the noise of battle so loud, but it seems to be even more valuable. It begins with essays on "The British in India" and "China and the West," and closes with an article on "The Lunar Zodiac of India, Arabia, and China," all of which are just such comprehensive, clear, condensed statements of fact and truth as scholars rejoice in having always at hand. Then there are articles on Max Müller's views of mythology and a science of religions. Professor Whitney does not believe that mythology is a disease of language, and he looks for light from a truly scientific comparison of religions, but not from Professor Müller.

The marrow of the book is the phonology. Professor Whitney's essays on this subject had never been given to the general public, and had been for years wholly out of reach. The extent and depth of his investigations will surprise many who thought themselves pretty well acquainted with his work. We have here "The Elements of English Pronunciation," "The Relation of Vowel and Consonant," "Bell's Visible Speech," and "The Sanskrit Accent." There is also an introductory essay on orthography, "How shall we Spell ?" which the readers of the *Nation* in 1867 will recognize as an old acquaintance. Professor Whitney is earnestly in favor of a reformed spelling It is not long since we had Professor Hadley's utterances to the same effect. Indeed, there is no difference of opinion among scholars on this point. It is strange that nothing can be done. We cannot help thinking that Professor Whitney overrates the lions that seem to stop the road. Some of the literary amateurs of the last generation, to be sure, roared loudly over the destruction of the history of our speech by phonetic innovations, and there may be still some mimetic noise of that kind among our minor essayists ; but there is a very good degree of general enlightenment on this subject. There is abundant hostility to the old spelling among the active class of our school superintendents and teachers, especially where there are German children in the schools. If Professor Whitney, and Professor Child for Harvard, and Professor Trumbull, who must be worried beyond measure with the unintelligible attempts at recording our Indian dialects which he has to guess out, and Professor Haldeman for the University of Pennsylvania, and other scholars of the kind, would make an effort, they would find it more successful than they hope. If they would agree on lists of words in which the spelling may be changed, so as to make them conform to analogy and draw them towards a general alphabet and yet leave them recognizable by common readers, they might certainly have the spelling used in their own papers in the transactions of learned societies. The Philological Society of England permits its members to use their own spelling in its printed transactions These gentlemen might surely move the American Philological Association, the Oriental Society, the National Educational Association, and very likely our scientific associations. The teachers of England and Wales have appointed a committee to examine this matter for them. Measures have already been taken in Germany for the rectification of the spelling of the new Empire. A little definite precept and good example, and urgency from the authorities in scholarship of our universities, might secure a reform of the spelling of our public documents, and move the educational magnates of our common schools and the publishers of school-books, and then the battle would be won.

In the essay on the "Elements of English Pronunciation," Professor Whitney gives an account of all the sounds in his native speech, his method of forming each sound, and the frequency with which it occurs. It is a contribution to the study of English dialects, a subject which is attracting much attention in England. Perhaps a few comments on Professor Whitney's speech may suggest to some of our readers who are familiar with American dialects different from his to report them to Mr. A. J Ellis, at 25 Argyle Road, Kensington, W., London, for the English Dialect Society. Professor Whitney's is the traditional speech of a cultured family of Northampton, Massachusetts. He begins with the sound of *a* in *far, father*. He calls it open *a;* the *a* of *pan* he calls palatal, the *a* of *all* labial. He gives the open sound in *calm, answer, pass, blaspheme, path, after, laugh*, and the like. The writer of this notice is a native of Worcester, Massachusetts, a graduate of Amherst College, and has since lived in the city of New York, in Fredericksburg, Va., and in Easton, Pa. In Worcester we were carefully taught at school to give in most of these words an intermediate sound between *far* and *pan*. In Virginia a cherished tradition of the blue blood requires the *a* of all these words to be fully as labial as that of *all* in New England. The palatal sound is, however, common there ; it prevails in Pennsylvania, except before *r*. Professor Whitney's open *a* has a decided labial tone to one long used to the *a* of the Middle States.

Prof. Whitney pronounces *pair, there, wear*, with the sound of *pan* protracted and followed by a vanish. We have everywhere heard this as the prevailing sound. Those who use the sound of *a* in *pay* are exceptions in a college class in Pennsylvania as well as in Massachusetts. The *e* in *met* he used to give in *plague, naked, catch*, which are familiar to us, and in *snake*, which is not. "So far as I know," he says, "*any* and *many* are the only words in which *a* is allowed to be pronounced as short *e*." We have everywhere heard *ĕ* for *a* in *exemplary, corollary*, and the like. He describes the vowel sound of *they* as a slide beginning with *e* in *let* and ending in *i* in *pin;* he gives the same sound in *fate, fail, great, they*. We make this slide in *they* uttered alone ; but make no *i*-vanish in *fate, fail, great*, or in *they* prefixed—*they came, they ran*. He describes the vowels of *what, war, hole, fall, foot*, as a series produced by increasing rounding of the lips. We do not round the lips for the vowels of *lot, naught*, but make a change in the back of the mouth. He says his *what* might with equal propriety be regarded as the short sound of *war* or *far*. Our *lot* is a good short of *war*, but not of our *far*. He gives the *a* of *all* in *God* and *dog*, a familiar pronunciation, exceptional certainly in Virginia and Pennsylvania.

No true short *o* is recognized by orthoepists as English. Professor Whitney makes one in a few common words—*none, whole, home, stone, smoke, folks, coat, cloak, toad, throat*, and he hears it from others in *bone* and *boat;* we will add *only, both, spoken, hope*. In Pennsylvania and Virginia short *o* is used, but is so like long *o* in quality that it is not noticed. The New England sound has a shade of the neutral *ŭ*, which is also common in Pennsylvania. Long *o* in *low* he makes with a vanish to *u*, and he gives the same vanish also in *four, door, note, moat*. We give a different

* 'Oriental and Linguistic Studies. Second Series. The East and West ; Religion and Mythology ; Orthography and Phonology ; Hindu Astronomy. By William Dwight Whitney, Professor of Sanskrit and Comparative Philology in Yale College.' New York : Scribner, Armstrong & Co. 1874.

vanish in *four, door*, and none at all in *note, moat*. Long *u* is heard in *fool, rule*, and Prof. Whitney says he makes exactly that same sound in *tube, dupe, nude, sue*, and the like, and also in *use, cube, pure, fume, mute*, and the like ; but in the last class of words he prefixes *y* to the *oo*, as distinctly pronounced as if it were written : *music* is *myoosic*. In Virginia *u* in *tube* is pronounced as in *music*, and the sound is not *yoo*, or even *ioo*, but a single vowel intermediate. It is a well-known shibboleth in the *tube* class of words, and a stranger betrays himself by giving either *i*-sound or *oo*-sound, just as a beginner in French does in trying for French *u*. We do not make, nor do we hear in Pennsylvania, *y* or *oo* in *music*, but a steady or slightly gliding intermediate. *Squirrel* with *i* as in *irritate* is the traditional polite pronunciation of many Virginian families. Prof. Whitney is fully persuaded that for long *i* in *mine* he begins with *a* in *far* and glides to *i* of *pique*. In close syllables like *type, tight, desire*, we begin somewhere in the middle of that glide and glide very little. He is for putting down the "reasonless and senseless infection" which spreads the pronunciation of *either* and *neither* with long *i*. We have never lived in an infected region.

He speaks of the locality of the palatal *ow*, *ău*, in *now, cow*, "which the English are wont to regard as American, the Americans as Yankee, the New Englander as Pennsylvanian or Southern, and so on." We believe that it most prevails as a polite pronunciation in Southern Maryland, saving always in the word *cow*, which is nearer *coo* and a shibboleth. We have been assured by a native expert that at least three *ou*-sounds must be carefully distinguished in familiar words to speak unimpeachable Virginian. Professor Whitney says that *a* alone of final vowels passes distinctly into the *u* of *but*, as in *Asia*. Youth of unquestionable polite tradition in Virginia, and more rarely in Pennsylvania, run to the same pronunciation of final *o*, not only in English but in Latin and Greek words. Perhaps the current squeamish change of *i* to *ŭ* in *Cincinnati* and other Western geographical names is worth mention. The secondary accent has much less power to preserve the vowels in Virginia than in Massachusetts or Pennsylvania ; *circumstance* has there a neutral final syllable.

Prof. Whitney's *r* is untrilled and silent when final. We utter final *r* when the next word begins with a vowel. It is less distinct in Virginia than in Massachusetts or Pennsylvania. We close to a distinct buzz in making *y* as in *you, ye ;* not so in making *w*. Prof. Whitney makes both without buzz, Mr. Ellis buzzes for *w*. We call *b, d, g* sonant mutes with Prof. Whitney, but much that he says of their sonancy does not seem true of our utterance. A murmur is often made before opening the lips for *ba*, and after closing them for *ab ;* and he thinks this prior or subsequent tone is the "sole characteristic distinction" between *b, d, g* and *p, t, k ;* but we do not make any such tone half the time before *b, d, g*, certainly almost never before *g*, and we have learned to make it quite well before *p, t, k*. In whispering, also, we never imitate this murmur as we do the vowels ; we do not make the slightest whisper rustle before *g ;* and finally, in talking with inhaled breath, a choice experiment, we have not succeeded as yet in making a murmur before an initial mute, but we make a very fair *g* or *b* or *d*. The position of the organs at the moment of movement seems to be the essential condition. Prof. Whitney objects to calling these letters *soft* or *weak*, and has a page of hard sayings about the wonderful ignorance and heedlessness connected with it. *Sonant* seems to us more scientific, but we all call the vowels *soft* poetically, popularly, and not quite senselessly ; and it does not seem to us to be wonderful that these vowel-like consonants should be called soft, or that the process by which vowels assimilate consonants to themselves, the common change of surds to sonants, should be called softening or weakening.

Prof. Whitney makes what we call *tongue-tied s, z, sh, zh*, resting the tip of the tongue against the inner face of the lower front teeth. He knows that it is more common to raise the tip of the tongue to the roof of the mouth. We find by enquiry four or five in the hundred who make his letters. Perhaps some peculiarity of his organs misleads him to regard the place touched on the roof of the mouth as the essential difference between *s* and *sh*. It is not so with us. Our *s* is a buzzing tip of the tongue, *sh* a buzzing channel of front and tip ; and we can make *s* far back, as we can *t* or *r*. *Nature, natyoor*, with a true *t* and a buzzing *y*, quite unlike the prevailing *nachur*, is native speech in many Scotch-Irish families in Pennsylvania. Prof. Whitney describes *h* as the representative of a different letter in each different combination : in *ha, h* is a surd *a—h* is to *a* as *k* is to *g ;* in *hi, h* is a surd *i ;* in *wh* in *what, h* is a surd *w*, and so on. We do not expel the breath in such a way as to call out the peculiar tones of the *a*-chamber in making *h* of *ha*, any more than in making *p* of *pa*. In making *a* we sound a distinct, though brief, click and buzz before the tone of *a ;* and this buzz, for which we have no sign in English, but which may be indicated by the smooth breathing in Greek, seems to us to be the proper sonant to pair with our *h*. As for *wh* (*i. e., hw*) in *what*, the description of it in Prof. Whitney's fashion, as a surd *w* followed by a sonant *w*, would be incorrect if we were to use it. We distinguish *w* from *u* by its having a consonantal movement of the lips ; but in *what* there are no two consonantal lip movements, and so no two *w*'s.

The article on the relations of vowel and consonant begins with *a*, which has most tone of all the letters, and arranges the alphabet in series of letters having less and less tone, and in three lines, according as the modification of the tone is made with lips, tongue, or palate. As far as tone predominates, the letters are called vowels, the rest consonants ; some are on the dividing line. This gives a very good view of the common English letters, though not, of course, in their natural historical relation. We have at first only three vowels—*a, i, u*. If we put these as the corners of a triangle, and then represent the new letters as springing from them, we find that the lines of descent run first toward one letter and then another, and the whole gets to be an interlacing thicket. But it is hardly the thing to criticise good work for not being what it does not pretend to be. It is a real objection to the scheme that some of the sounds are the results of complex adjustments, and do not seem to fall on any one of these lines of closure ; *a* in *all*, for example, and *o* in *not*, are put on the line of labial closure, but are really dependent on a rounding of the back part of the mouth more than anything else. Prof. Whitney holds that syllables are the work of the hearer, who groups the closer sounds around the more open. But take the word *Eetion ;* we certainly make the two first syllables, *Ee*, by making two separate jets, or pulses, of breath ; we make the two last, *tion*, by two more pulses, and it seems to be the same process when we pronounce any word in distinct syllables. Pulses of breath seem to be dividers of syllables. What Prof. Whitney says of his examples does not always describe our utterance. We give two impulses for *apple*, and close *p* audibly on the first pulse of voice, and open it audibly on the second. He says we cannot make a syllable with *s ;* but we often hear, and utter, such syllables, in plurals and possessives, for example, where in careful pronunciation there are repeated syllables in *s* with an unaccented vowel, as in *princesses*. In careless pronunciation, or whisper, the *e* is dropt, and we have distinct pulses of breath, and so distinct syllables of nothing but *s*.

There is plenty more in the book to stimulate and guide the lovers of this kind of research. We trust it may give a new impul e to the most thorough study of the science of language.

## MACREADY'S REMINISCENCES. *

ENGLISH literature contains more than one entertaining volume relating to the player's art ; but these memoirs of Mr. Macready are more interesting than the 'Apology' of Colley Cibber, or even than the charming autobiography of Holcroft. There is nowhere so copious and confidential a record of an actor's personal and professional experience. Mr. Macready died two years ago, at the age of eighty, and his last appearance in America had been in 1849, so that to the younger generations of the present time he is little more than an impressive name. But this thick volume will have the effect both of reviving the regret of all late-comers for lost opportunity, and of making the man, as he stands portrayed, interesting to those who have never seen the actor. In one way and another, though with very little method and often rather awkward art, what we have here is the elaborate portrait of a character. There is a good deal of evidence that Macready was a cold actor—according, at least, to the latest taste of the time ; that he was stately, impressive, and accomplished, but mechanical, artificial, and stilted. The work is full of comments upon the plays and parts in which he performed, and from year to year there is constant mention of his playing "The Stranger"; but we do not remember a single note of disapproval of the false taste and false style of this now intolerable melodrama. If he were to reappear in life and play before us as he played in 1835, it is very possible that we might find him wanting in warmth, in nature, and in what is popularly termed magnetism. But there is no doubt that his acting would, in its way, seem very strong and individual ; and of this strong, individual temperament these pages offer a vivid reflection. The character they reveal seems, at times, not especially sympathetic, and even scantily amiable ; but, as one continues to read, one's kindness for it increases ; and one lays down the book with the sense of having made the acquaintance of a man who on the whole was very much a man, and who had an ample share of honorable and elevated qualities.

Mr. Macready began in 1855 to write an account of his life for the use of

* 'Macready's Reminiscences, and Selections from his Diaries and Letters. Edited by Sir Frederick Pollock, Bart.' New York : Macmillan & Co. 1875.

his children. But he carried his narrative, which is copious and minute, no further than the year 1826—the time of the first of his three visits to America. In 1827, however, he began to keep a diary, and continued the practice for the rest of his long life. The early entries are brief and scanty, but they expand as the years elapse, and at last are very agreeable reading. Like most men of his profession, Mr. Macready was rather fond of a large phraseology, and it is perhaps an advantage to the reader that he is not always really pretending to write. His jottings are often as explicit and leisurely as many people's finished periods. Sir Frederick Pollock is a very unobtrusive editor, but he has done all that was necessary. He has given us the long fragment of autobiography and, as a sequel, the whole mass of the author's diaries up to the time of his retirement from the stage—a period of twenty-four years. To these he has added a few letters, written from the country during Mr. Macready's last years, and throughout he has supplied the needful notes as to names, dates, and persons. The work, therefore, is modestly but sufficiently edited. The first thing in it that strikes us is that—strange as it may appear—Macready greatly disliked his profession. It offers the singular spectacle of a man acting, almost nightly, for forty years, and yet never loving and often hating what he was doing. Macready went upon the stage almost as a matter of course, his father being a country manager, and his patrimony nil. He remained upon it because he had a wife and many children to support; but his disgust with his career, prosperous and brilliant though it had been from the first, was at times so oppressive that at one moment he was on the point of quitting the stage, emigrating to America, and taking up his residence at Cambridge, Mass., to escape social expenditure and establish his children. We take it that, if we may make the distinction, his intellect was in his profession, and his heart out of it. He was as little as possible of a Bohemian—he was what is commonly called very much of a gentleman. There is a happy line about him in Tennyson's sonnet, read at the very brilliant dinner given him in London on his retirement from the stage:

"Farewell, Macready; moral, grave, sublime!"

How sublime he was we who did not see his Lear, his Macbeth, or his Virginius have no means of knowing, but he was evidently very moral and grave. He was devoutly religious, as his journal abundantly proves, and he was very fond, as we observe in the same record, of stoical Latin epigraphs and invocations. Compared with most members of the theatrical profession, he was an accomplished scholar; he was zealous, conscientious, rigidly dutiful, decorous, conservative in his personal tastes and habits. He was never popular, we believe, with the members of his own profession, who thought him arrogant and unsociable, and for whom he fixed the standard, in every way, uncomfortably high. It was perhaps an irritating sense of all this that prompted an anonymous ruffian, while Mr. Macready was acting at Cincinnati in 1849, to protest by hurling upon the stage, from the gallery, the half of the raw carcass of a sheep; and it was certainly the same instinctive hostility of barbarism to culture that led Edwin Forrest to denounce his rival in a vulgar letter to the London *Times* as a "superannuated driveller," and to suffer his followers to organize the disgraceful scenes of the Astor-Place Riot. Of these scenes Macready's journal contains a very interesting account; a street-row in which seventeen persons were killed deserves a place in history. Macready was an unsparing critic of his own performance, and he is perpetually berating himself for falling below his ideal. His artistic conscience was evidently very serious and delicate. "My acting to-night was coarse and crude, no identification of myself with the scene, and, what increased my chagrin on the subject, some person in the pit gave frequent vent to indulgent and misplaced admiration. The consciousness of unmerited applause makes it quite painful and even humiliating to me." "I went," he elsewhere says, "to the theatre thinking first of my dress, and secondly of King John. I am ashamed, grieved, and distressed to acknowledge the truth. I acted disgracefully, worse than I have done for years; I shall shrink from looking into a newspaper to-morrow, for I deserve all that can be said in censure of me." "Acted with tolerable spirit," he writes in 1832, "to the worst benefit house I ever played before in London; but thank God for all he gives." When he has played well he commends himself as liberally, and he feels that the praise is deserved. "Acted Macbeth most nobly—never better." "Acted Iago with a vigor and discrimination that I have never surpassed, if ever equalled." "Acted Brutus as I never—no, never—acted it before, in regard to dignified familiarity of dialogue or enthusiastic inspiration of lofty purpose. The tenderness, the reluctance to deeds of violence, the instinctive abhorrence of tyranny, the open simplicity of heart and natural grandeur of soul, I never so perfectly, so consciously, portrayed before." Just after this (in 1851) he makes a note of his last performance of Hamlet. "Acted Hamlet; certainly in a manner equal to any former performance of the part I have ever given, if not on the whole exceeding in power, consistency, grace, and general truth all I have ever achieved. . . . The character has been a sort of love with me. . . . Beautiful Hamlet, farewell, farewell!" We are struck in all this with the extreme variability of his performance to the actor's own sense—at least, when that sense is anything like as acute as Mr. Macready's. We go to the play one night and another, and on each occasion the Hamlet or the Richard seems to be putting forth all his energies. But from the standpoint of the "wings," apparently, this is quite otherwise, and the aspect of a particular part may shift, according to mood and circumstance, along every degree between the atrocious and sublime.

Both Mr. Macready's reminiscences and his diaries are filled with quotable matter of which, to our regret, we lack space to avail ourselves. He came into contact with most of the eminent men and women of his time, and lived on intimate terms with many of them. No actor since Garrick had so completely won a place in what is called society; and Macready had won it by his own strength and skill. There are innumerable memoranda of dinners at his own house during the last twenty years of his professional life, which, judging by the company assembled, must have been as agreeable as any then taking place. He had relations with all the eminent actors of the century, from Mrs. Siddons and Master Betty down to Mlle. Rachel and Miss Cushman. He played young Norval to Mrs. Siddons's Lady Randolph, and was called into the great actress's room after the play to receive some stately but most benignant and intelligent advice. His account of the scene suggests some trembling young aspirant admitted to a supernatural interview with the sacred Muse in person. He has a number of sketches of Edmund Kean, who, according to his account, played at times very badly; and also of the Kembles, whom he evidently disliked, and concerning whom we should say his testimony must be taken with allowance. Speaking afterwards (very intelligently) of Mlle. Rachel, he says that in many points she was inferior to Miss O'Neill—a statement that renews one's regrets at having been born too late to see this actress, concerning whose mastery of the pathetic contemporary evidence is so singularly unanimous. But there are some remarks in one of his letters late in life about Ristori which are strangely unappreciative, and which confirm one's impression that his own acting and the acting he admired had little of the natural, realistic quality that we admire so much nowadays. We get a sense, however, that, natural or not, the English stage in Macready's younger years was in some ways a more respectable institution than it is now. The number of provincial theatres was greater; small country-towns had frequent visitations of players; and the most accomplished actors did not think it beneath their dignity to play short or secondary parts. Macready, in the fulness of his younger reputation, played Friar Lawrence, Prospero, and Joseph Surface. Many of the older tragedies, which have quite passed out of the repertory, were then frequently performed. It may be that they would now be, in parts, too dull for the audience, but they would also be too difficult for the actors. Who is there now to serve in "King John" and in "Lear" with the Fool? The players of seventy years ago were stilted and declamatory; but we gather from the allusions of the time that the average actor, knowing his business, could acquit himself more honorably of a passage of tragic blank-verse, with its various inflections and cadences, than those of our own time. The absence of scenery and other aids to illusion laid greater responsibilities upon the actor; he had to act more, as it were. "She was a mighty pompous woman," we heard lately of a long-lived old gentleman, with a vivid memory, saying of Mrs. Siddons; and this, which in a certain sense implies blame, also implies praise—implies that she had authority, weight, and style—attributes in which Miss Clara Morris, for instance, is deficient. Macready, we imagine, was a trifle pompous; but if his acting was somewhat heavy, there was also weight in his character. He undertook the management of Covent Garden Theatre in 1837 with the explicit design of elevating and purifying the drama, and several of the most successful plays of our time—"Richelieu," "The Lady of Lyons," "Money"—were produced under his auspices.

But for information on this and other points connected with theatrical history we must refer the reader to the volume before us. Our own interest in it, we confess, has had less regard to its theatrical than to what we may call its psychological side. Macready, as a whole, strikes us as essentially histrionic. When he reads in a newspaper of the death of an American gentleman with whom he was apparently but slightly acquainted, he notes in his diary that he was "struck down with anguish." He was playing, in a manner, before himself. But there is something very fine in his combination of the dramatic temperament with a rigid conscience and a strenuous will.

## RECENT NOVELS.*

MR. ANDREW JOHNSON will probably not be the only person who will experience the peculiar sensation, on looking through the pages of 'Alice Brand,' of seeing himself paraded in semi-fictitious guise as a party to the "romance of the capital" there rehearsed, for the book has a slight historical bias, and the author is thus led to introduce persons who really exist, or have existed, under merely a slight veil of fiction. But the ex-President is the only one of those acting an important part who is brought before us without mask. To detect the identity of others the reader must refer to his memories of Washington society (if he have any), or else accept with a good grace the knowledge that he is looking at an historical picture, the figures in which have no distinguishable numerals over their heads, and to which there is no outline "key" provided. Of course, a story in which the actual inhabitants of a city and the airy creations of the author thus jostle each other, invites debate as to how far the novelist has a right to call for aid upon an element so liable to prove merely factitious as the presence of real people on the scene. There is something singularly pleasant in such blendings of the real and the imaginary when they are well managed; their appeal to the snobbishness of the average man is alluring; but it is also to be remarked how often and how easily the note jars instead of harmonizing. Thackeray succeeded with it in 'Esmond'; he almost failed with it in 'The Virginians.' Anthony Trollope has acquired considerable skill in shadowing real "swells" on his canvas, almost taking the reader's breath away by his ingenious management of royalty in a recent book; though, by altering names, he tones down the excitement to something like that which may be supposed to proceed from shooting, hanging, or burning prominent men in effigy.

But, however good the art, it must be confessed that it cannot reach any very high plane. Mr. Riddle is not wholly wanton in his use of this means. The notoriety which newspapers now give even to the interior intricacies of public men's lives must perhaps modify the practice of a novelist who enlists such men among his *dramatis personæ*, and, in this view, the ex-President may possibly be the property of Mr. Riddle or of any one else who chooses to seize upon him. For the rest, the author of 'Alice Brand' is very much in earnest about reproducing the life of a given place and period as it passed under his own eyes, and has, no doubt, done well to give us portraits instead of purely typical figures. We doubt his ability to convey a great deal by the latter means, for his hero and heroine are not very clearly defined, and we suspect that his persons are lifelike just in proportion as he sketched them from individuals before his mind at the time. The perspective and finish of the book, accordingly, are unsatisfactory; background and foreground are interchangeable at will; and the love-story of Colonel Mason and Ellen Berwick far outstrips in interest that of Frank and Alice. Mason's Congressional experiences give rise to some rather interesting passages, which, with the scenic and somewhat questionable glimpses of lobbying and pardon-broking operations, suggest regions of research from which a master might draw something worthy the pains. Mr. Riddle's use of such material is hap-hazard, however; he should study Bulwer's elaborate, almost valetudinarian, care in economizing similar matter. In his management of the legal manœuvres, too, on which the plot turns, he is much too technical. The style is often absurdly inflated, as when the notes of bluebirds are said to drop "like spangles from the buskins of God, still hovering, almost seen, over his new creation"; at other points it becomes vulgar and reckless, as when the author speaks of men "on the make" and a convention that "said its say, did its do," etc. The clumsiness of the *résumé*, in the last pages, of all that has happened since the date of the story to a number of public men who have nothing whatever to do with it, is almost incredible. But, with all its faults and its weakness, 'Alice Brand' has vigor in it; the study of the mischievous, honest, impetuous American youth, Grayson Vane, is not bad; and among American novels which make a point of being watermarked with their nationality, it will stand above the average.

We don't know what the anonymous author of 'The Rainbow Creed' set out to do when he wrote the book that bears this name; but it seems safe to assume that, whatever it was, he did not succeed in doing it. In any case, it is quite certain that he has not written a novel; for though it is called a "story of the times," it is not a work of the imagination at all, and the pseudo-fictitious air assumed by it is of the kind long since grown familiar as a means of advertising personal opinions. In this case, the opinions are advanced under cover of a supposititious divinity student, one Malcolm Lawson, who saves the life of a wealthy orthodox merchant, and is promised the hand of the latter's daughter provided he will stick to the creed of the college where he is studying. The young man, however, discovered "that he was only a Christian, and that if he intended to devote himself to the improvement of his race it might be necessary to become a Liberal." The rest of the book, consequently, is consumed in the statement of the intellectual contortions which he passed through. He became much too clever at talking about the Universal and the Particular, the Highest Reason and the Holy Spirit, his own Egotism, which must have "justice" done to it, and many other matters (chiefly elevated to the plane of a mystic philosophy by the use of capital letters)—so that there is small doubt in our own mind that he could have even written a book equal to 'The Rainbow Creed'—and was ultimately expelled from the college. Now came the tussle with his prospective father-in-law, who, in spite of his horror at Malcolm's heresy, admired the young man's boldness and sincerity, which he had the sagacity to descry underneath all his ravings of mystical, radical, religious slang. They couldn't agree, however, and Malcolm was about to leave the house and abandon his *fiancée* for the time being, when she opportunely burst a blood-vessel, and the disaster brought them all to their senses—Malcolm at once entering "the church," under the auspices of several ministers of a liberal turn of mind whose existence had not been up to that moment even hinted at by the author. We confess that he shows great presence of mind in remembering the blood-vessel and the liberal clergymen just at this juncture; but if he had had the good fortune to think of them a little earlier—in the opening pages, for example—a great deal of useless trouble would have been saved both to the author and those who may chance to become his readers. It will be readily seen from the following passage that the author understands how to mingle the profundities of consciousness with superficial description so that neither shall be too clear:

> "The moonlight yields to the gas-glare of the Christian sociable, and the bones gleam in the gorgeous apparel of the ball; for Dr. Lullaby is the ghostly pastor of the ghosts. Hark! the necropolitan festivity begins with a prayer, and a thousand spectral fans pat responsive to its exquisite rhythm. . . . Yet I marvel still more as the votaries of Fashion interblend, and lose each his personality in confused circles of satin and silk, of velvet and coral, of diamond and flounce, the green interblending with the gold, the drab with the purple, and the pink with the pale—a perfect chaos of broken rainbows in softest collision: children of Death playing with peacocks' feathers on their father's hell-lit tombs; a Catherine-wheel revolving furiously on the cross of Christ or on the edge of the gallows."

We recognize a kind of energy here and elsewhere in the book, and enough of it, perhaps, to counterbalance a good deal of symbolic drivelling and convince the author's own partisans of the soundness of his views—if it could be ascertained that he had any. But the only theory we can discover in it is that "the mind must be occupied; and although our writing and our speech may not amount to more than a rope of sand, the honest employment of its energies to the repression of its ever-surging recklessness . . . is our salvation." The writer has occupied *his* mind with a vengeance, and we conclude that his "salvation" is from the insanity likely to ensue upon the retention in the mind of such trash as is here shot into the market. It might be entertaining to carry out a suggestion afforded by this statement of the case, and consider systematically the probable preventive influence upon mental disorder exercised by the increase of enthusiastic or benevolent publishers and modern improvements in the printing-press.

We turn with relief from this anonymous exhalation to a story so innocuous and even attractive in its way as Miss Fraser-Tytler's 'Mistress Judith.' The English reviewers, who always seem to carry about with them some reference to standard specimens, arranged in a slip-knot to close at random upon the first object that comes to hand, harnessed Thomas Hardy a short time ago to George Eliot, and they have now connected 'Mistress Judith' with 'Sylvia's Lovers,' by Mrs. Gaskell. Its kinship with Mr. Hardy's books is much more obvious. There is none of the stern, set earnestness of Mrs. Gaskell here, and form, method, and coloring all suggest the author of 'Under the Greenwood Tree' very directly, though Miss Fraser-Tytler is superior to her model in simplicity of diction. The book offers a curious instance, nevertheless, of the promptitude with which a genuine hand-made product will be imitated by means of ingenious machinery. Mr. Hardy's books, counting in certain weaknesses of construction and over-labored modes of expression, have a primitive artistic char-

* 'Alice Brand. A Romance of the Capital. By A. G. Riddle, author of 'Bart Ridgely,' 'The Portrait,' etc.' New York: D. Appleton & Co. 1875.
'The Rainbow Creed. A Story of the Times.' Boston: Wm. F. Gill & Co. 1875.

'Kaferfelto. A Story of Exmoor. By G. J. Whyte-Melville. With Illustrations by Col. H. Hope Crealocke, C.B.' London: Chapman & Hall; New York: Scribner, Welford & Armstrong. 1875.
'For the King's Dues. By Agnes Macdonell, author of 'Martin's Vineyard.'' New York: Macmillan & Co.

acter that makes them unique. Miss Tytler, with a keenness quite commercial, at once supplies the market with a ware having somewhat the same effect and produced at much less cost. We have sometimes thought that in the history of English fiction the "period of the moulds" has come at last, and this would seem to be a case in point. 'Mistress Judith' is a pretty porcelain vase decorated with "landscape and figures." Beyond its cheapening effect, there is no harm whatever about it, and much that is good. It is a bright and healthy little book, calling for a momentary use of cambric, possibly, in its sad catastrophe, but the reading of which is no more vexatious than the inhaling of an April day. This, as novels go, is saying a good deal. If we remember aright, Miss Tytler began her literary career some five or six years since with a little volume called 'Sweet Violet, and Other Stories,' and as we now recall the gloved and perfumed daintiness of those stories, we judge her to have made good use of the intervening period. Judith, Master Hurst and his wife, and the Parson are neatly characterized with something of the acuteness of silhouettes, but more color; and though the two young men of the tale are little better than wig-blocks, we are content to take the whole as it stands on the strength of its amateurish good faith.

Mr. Whyte-Melville, we see, retains a zest for the game he has practised for so many years. The cards, to be sure, are a trifle worn by the thumb, but there is always a fresh interest in seeing what will turn up next; and it is really delightful to observe the dealer's interest in the process. We who have seen it done before, however, are not greatly startled when we discover a fine horse, called "Katerfelto," after a certain charlatan who owned him, in the hands of the hero John Garnet, and that this horse is going to be a chief trump-card. Nor would it be possible for us after this not to feel grossly defrauded if the author had denied us a highway robbery; for the time of the story is the early part of George the Third's reign, and improbability could not be pleaded. But we are treated to the robbery, to gipsy love and revenge, and a thrilling episodical stag-hunt, and out of it all comes pardon at last, return of the outlawed hero, and happy marriage. The story is illustrated with drawings by one Colonel Crealocke, which remind us that there was once a young artist called Clive Newcome. Both text and pictures somehow have a not unpleasant atmosphere of the smoking-room in a club somewhere on St. James Street, say; and we believe they will be very acceptable to any one who has a wet day in the country and a few cigars at his disposal. For ourselves, in reading 'Katerfelto' we have experienced a certain conservative quiescence, assisted by Whyte-Melville's evident solid old-fashioned conviction that there can no more be two ways of writing a good novel than of brewing a good whiskey-punch.

The most observable point of merit in 'For the King's Dues' is its picturesqueness. Mr. Tilton says he remembers in pictures, and Mrs. Macdonell—if we may take the liberty of drawing even so remote an analogy between anybody and that celebrated plaintiff—appears to compose in pictures. The story opens with a scene which is really but a little thing, and yet it seizes the eye and memory like one of Fortuny's rough sketches. It describes Miss Amice Blunt, a young lady of the year 1782, sitting among the rocks on the coast of Sark, dressed in a pink paduasoy and (probably) smuggled lace, too absorbed in reading that new work, 'The Vicar of Wakefield,' to observe the waves closing in around her. The thread of the story is not remarkably strong, though well enough for its purpose, but it is strung throughout with such taking scenes as this. A novel about the island of Sark at this date is novel indeed, and therefore fresh and diverting reading; but the *motif*—which is the interest of certain well-born people in the fortunes of certain peasants—is of well-known and perfectly respectable standing, just as is the visiting of the poor by charitable ladies. The Baroness Tautphœus alone nearly succeeded in exhausting the subject in her novel, 'Quits.' Although it does not strain the vision to see the end of the plot of the Sark story some time before it is reached, yet its unravelling is so rapid and vivacious that a sufficient sense of surprise is conveyed. The story is of course a romance, though founded on facts (concerning smuggling between France and England, with the Channel Islands as an entrepôt) which are historical; but, as a romance, it leaves a wholesome taste in the mouth, being unsensational, refined, and high-toned.

---

*An Essay on the Madonna in Christian Art.* By Henry Martin Ladd, of the Class of 1875, in the Theological Department of Yale College. (New Haven. 1875. 8vo, pp. 93.)—It appears from the notes preliminary to this essay that a body called the "Kingsley Trust Association" founded a year or two since an annual prize at Yale College of $250, to be awarded for an English essay, written by a member of any department of the College who may be pursuing a regular course for a degree. The prize is named, awkwardly enough, "The John A. Porter University Prize." The subject is to be chosen by the trustees of the Kingsley Trust Association, and the prize is to be awarded by three judges, two appointed by the president of the College and one by the trustees of the Association. Two subjects (at least) were given out last year—one, that of the essay before us, the other, "The Causes of Cromwell's Failure." How many competitors there were for the prize does not appear. Two of the judges agreed in awarding the prize to Mr. Ladd, and the Kingsley Trust Association have authorized the publication of his essay "in the hope that the interests of literature in the University will thereby be promoted." These circumstances give a certain importance to the performance. We have here not only a work which has been esteemed by representatives of Yale College as deserving a large pecuniary reward, but the publication of which they hope may promote the interests of literature.

In the first place, we must remark that the selection of subjects, judging by the two already mentioned, seems eminently unsuitable. To propose to young men to write on "The *Failure* of Cromwell" is to assume what most students of history would deny. To propose to an American student to write on "The Madonna of Christian Art" is to offer him a subject on which, for him, original investigation or thought is impossible, and which he must, from the nature of the case, treat at second or third hand. In writing upon it he is likely to be tempted into two of the worst faults of imperfect culture, viz., unsupported and loose assertion and vague sentiment. We could excuse these faults, which are palpable enough in the essay before us, on the ground of the poor selection of the subject, but it exhibits other and still graver defects for which no such excuse can be admitted.

The author puts in front of his essay a list of the authorities "consulted, and in some cases freely quoted," and it appears that in writing on a subject which required, for anything like a proper treatment of it, recourse to German and French authorities, the only works by foreign authors he has made use of are the translations of such familiar books as Kugler's and Lübke's histories, and Taine's 'Art in the Netherlands.' For all that his essay shows, even these might have been omitted without harm. All his other authorities are of the commonest and most accessible sort—Ruskin, Mrs. Jameson, Hamerton, Hazlitt, Jarves, and, of all men, Charles Lamb! Such a list should have indicated to the judges that the essay was not likely to deserve a prize. And this prepossession ought to have been confirmed by its contents. It opens with confused thought concerning the relations of art and religion, and then goes on to discourse of the phases of Christian art in a way that shows the writer's want of knowledge of general history, as well as of that of his special topic. Already on page 2 occurs a statement which we should conceive must have given pause even to the most lenient of judges. The writer, speaking of the Madonna, says: "She was a Christian goddess, embodying the beauty, maternity, and chastity of the Pagan Venus, Horus, and Diana." Our astonishment over this incredible assertion is redoubled when, on p. 83 of this essay, we come again on the same statement, "In her were combined the several Pagan conceptions of Venus, Horus, and Diana"! The simplicity of such a show of ignorance under the pretence of learning would awaken a feeble compassion, were it not that Mrs. Jameson, with whose 'Legends of the Madonna' the author has a suspicious familiarity, might have saved him from this discreditable and mortifying blunder. She says ('Legends of the Madonna,' Introduction, p. xxii.): "It is worth remarking that Cyril, who was so influential in fixing the orthodox group, had passed the greater part of his life in Egypt, and must have been familiar with the Egyptian type of Isis nursing Horus." But Mr. Ladd's obligations to Mrs. Jameson were so numerous that he may have hesitated to burden himself with another. He informs his readers at the outset, as we have seen, that he has "in some instances freely quoted" his authorities. An unsuspicious reader would take it for granted that in such instances quotation marks would be used, but this is not Mr. Ladd's practice. For instance, he devotes several pages (pp. 53–56) to what he calls "the progressive treatment of the Madonna as a subject of Christian art." These pages are a mere abridgment of pp. xxi. to xxxi. of Mrs. Jameson's Introduction, her language being often partially retained, but given in such a way as to remind one of Coleridge's definition of a certain class of readers who absorb what they read as a sponge does water, and give it out again, as a sponge does, much as they took it in, only a little dirtied. There is no specific acknowledgment in these pages of direct borrowing; no reference whatever to Mrs. Jameson; no use of quotation marks when her words are cited. In a similar way, pp. 82 and 83 and 84 are wholesale conveyances

from the same worthy writer. A single instance will show the sort of work our sciolist has made of her good English :

Mrs. Jameson wrote :
"It is curious to observe, as the worship of the Virgin-mother expanded and gathered to itself the relics of many an ancient faith," etc., Introduction, p. xx.

Mr. Ladd writes :
"Little by little, as the worship of the Virgin expanded and grew, it gathered to itself the flower and the fruit of many an ancient faith," p. 83.

The opinions advanced in the essay are worthy of the scholarship shown in it. The subject is not grasped, and is treated without intelligence. Mistakes of fact are not infrequent. Altogether, it is a pity that this worthless production should have appeared under university auspices.

---

*Materials and Models for Latin Prose Composition.* By J. Y. Sargent, M.A., Fellow and Tutor of Magdalen College, Oxford, and T. F. Dallin, M.A., Tutor, late Fellow, of Queen's College, Oxford. Second edition. (London, Oxford, and Cambridge : Rivingtons. 1875. Pp. xliii. and 362.)—*Parallel Extracts,* arranged for Translation into English and Latin, with Notes on Idioms. By J. E. Nixon, M.A., Fellow of King's College, Cambridge, Classical Lecturer, King's College, London. Part I. Historical and Epistolary. (London and New York : Macmillan. 1874.)—The first-named book has passed to a second edition since 1870. The material is taken from standard modern authors, and arranged in five sections, as follows : Historical, Characters, Oratorical, Philosophical, and Epistolary. With a very proper wish to combine translation into Latin with reading Latin, the editors have appended to each English piece references to analogous or similar passages in classical authors of approved merit. The student is thus furnished with a model in his attempt to render them into Latin. The pieces set for translation are short, which is a good thing ; and diversified in kind and style, which is another good thing. The 'Materials and Models' are admirably adapted either for college instruction or advanced private study. We hope that a professional man may here and there be found who will take it up after his day's work and try his hand at a few sentences. Of the second and much smaller book, the 'Parallel Extracts,' a good word may also be said. The classification of extracts is much the same with that in the 'Materials and Models,' but in this part—Part I.—only historical and epistolary passages are given. On every left page there is a Latin extract, on the right page an analogous English extract. There are some very useful Notes on Idioms at the beginning, which are constantly referred to in the extracts. This book is well suited for a younger class of learners. Perhaps there is a little too much of Pliny in the epistolary part.

# Fine Arts.

## FIFTIETH EXHIBITION OF THE ACADEMY OF DESIGN.

III.

THE painters in miniature scale have always enjoyed in our exhibitions the conspicuousness of small numbers and marked merit ; the subject in Louis XVI. costume, by Mr. Knight, to balance the subject in Louis XIII. costume, by Mr. Beaufain Irving, on the other side of the doorway, has been as much as our lovers of the art of Pécrus and Plassan could usually find to sharpen their eyesight upon. This year Mr. Irving is alone in his specialty, unless we may consider Mr. Guy as a supporter. Mr. Irving's subject of a dozen figures, representing "Cardinal Wolsey and Friends" (272), is one of the most attractive pictures in the east room ; it is, for that matter, the most considerable specimen of art made microscopic that we remember to have been produced in this country. The splendor in which the Cardinal is known to have lived is revived in the scene with every ingenuity of representation and suggestion ; the picture is a mass of bric-à-brac, while the light dying over the lofty walls of the banquet-room is graduated with as much care as Mr. Church is used to employ in his skies. The guests are placed in a great variety of expressive attitudes, while each is an art-Crichton, finished to the finger-nail ; it must be confessed, however, that they all have the fixed and prepared look which almost inevitably accompanies this sort of painting, and that their individual perfection is a little wearisome. The countenance of Wolsey, too, is expressionless, and one feels sure that the mundane prelate would have listened to the songs of his favorite jester with rather more unction in his face. It is so rare and encouraging, however, to see a figure-picture in which no part has been slighted, that we are fain to congratulate the author of this painstaking and thorough piece of work ; his great merit seems to be that he never loses breadth of effect while attending to detail, and this, his most ambitious picture, is composed in one sweeping unity of light and shadow, to which all considerations are subordinate. A group called "Vespers," by Mr. Maynard (260), attracts at first sight by its quaintness of character, but inspection proves that the drawing is feeble, and the quaintness an excuse for loose and fumbling study ; it must be classed with the "Antwerp Market-Scene" (146) of Mr. Meeks, as a good subject vulgarized by halting execution. Mr. Wilmarth's single contribution, showing a charitable fellow putting a litter of puppies to bed in a disused oven while the parent dog steals his dinner (329), exhibits the most careful study from nature, with an arm and hand quite real in their action and saliency ; he has not thought it worth while, however, to give character to the cranium of his figure, whose back only is seen; the picture is therefore to all intents and purposes headless, a fault not easily pardonable when there is but a solitary character on the scene. A similar jest is attempted by Mr. C. S. Reinhart in "Caught Napping" (24), where a schoolmaster while lapped in Elysium is robbed of his luncheon by the boys ; the character of the teacher, one of the hard autocratic kind, and of the kind, too, that, being bred to the plough, always do nod themselves into helplessness the moment they relax, is very perfectly seized. Of all the works in which the endeavor is comic, however, we think Mr. James's "Amateur" (371) the most successful ; there is real humor in this dry and determined soubrette, who strains her lean arms and inflates her tough, bladdery cheek as she blows into the trumpet she has picked up, while her eyes are almost flying out of her head with the whole-souled effort. The entire pose shows the ardor and luxury of stolen pleasure, the conscientious endeavor to get all the good possible out of a surreptitious liberty, enhanced by the feeling that the next moment may probably bring discovery and disgrace. This picture is most carefully touched : the costume cunningly betrays the effort of the lungs which modifies the whole abdomen ; the carpet and accessories are minutely painted, and the embossed leather-work on the wall (whose pattern was stamped with a button in the wet paint, if we mistake not, that there might be no error in its regularity) is realistic and picturesque.

The exhibition shows works of another kind of humor, however, which, while we have no quarrel with the painters who produce them, might, in our opinion, be excluded by the committee with a confident expectation of support from all who have the interests of art in consideration. The example of Landseer, who painted a great number of animal-pictures showing human emotion, was always felt to be a perilous one, and the objections made in the cause of art were presently abetted by the ennui which this class of pictures was found at length to produce. It is a string which a very little scraping will attenuate. There are American proficients in this sort of fun who are so certain of a generous share of praise from whole crowds of good fellows seldom seen at art-exhibitions, that we think they might rest satisfied with these successes, without emulating the laurels offered by academic displays. The art that is always grinning through a horse-collar is very frank and harmless, but it seems to require the freedom of the open air, of the country store, or of the city refreshment-room, for its untrammelled display. Whether that be so or not, the pictures of this kind at the exhibition are such, in our opinion, as might have been safely declined, without loss of dignity, by the committee on admissions. One of them is an entirely reprehensible allusion to troubles that are just now lacerating a great many hearts in the community ; the tantalizing dog that holds the bones under his paw, the dog that gazes with large eyes of unassuageable melancholy upon the ruins of his home and board, and the dog, with plenty of fight in him, that confronts the two, may all be very apposite and expressive in a way; but the wit is stable wit, and has no place whatever in an exhibition of fine arts. Another picture, very much elaborated, shows a parrot plucked of its feathers, and swearing in an orotund manner with

all the energy of its thick black tongue. The execution of this and other paintings by the artist is not of a kind to bring him within the precincts of an academy; his carefulness is not art at all, but smoothness; his animal-study is halting in the extreme; as works of painting his productions would never attract the least attention. It is only for their supposed Hogarthian quality that they are admitted, and this quality, divorced from the ability to paint, is a merit suitable for bar-rooms and not for picture-exhibitions. There is even a lower class of pictorial jests admitted, and very readily sold, whose presence can only surprise the judicious eye; the examples are water-color sketches, in which large-eyed and cadaverous birds, or skeletons, or acrobatic rabbits, are the figures. They are not pictures in any technical sense; they are not in the least funny; and although they are now always stopped in that limbo of formless art called the corridor, we think a more exacting standard will soon stop them a few feet farther out.

JUST PUBLISHED.

## *Taine's Notes on Paris.*

Notes on Paris. The Life and Opinions of M. Frederic Thomas Graindorge, Doctor of Philosophy at the University of Jena, special partner in the house of Graindorge & Co. (oils and salt pork), Cincinnati, Ohio. Collected and published by H. A. Taine, executor. Translated by John Austin Stevens. Large 12mo (uniform with the recent editions of Taine's 'Italy,' 'England,' etc.), $2 50.

"One of M. Taine's brightest works. . . . The suppositious observations of one M. Thomas Graindorge, . . . who, having amassed a fortune . . . in America, returns to his native France, and jots down with a free pen [and] delicious wit what he sees. This outside view of their city greatly amused the readers of *La Vie Parisienne*."—*N. Y. Tribune.*

"Some of the brightest and wittiest sketches of Paris life that have ever been written."—*Boston Globe.*

## *Walford's Mr. Smith.*

Mr. Smith: A part of his Life. A Novel. By L. B. Walford. 16mo, Leisure Hour Series, $1 25.

"It is agreeable, at starting, to light upon a book of so many claims to originality."—*London Academy.*

"The chronicling of small-beer has been done faithfully by some of our best writers who have had sufficient skill to interest all the world in the record. . . . The author of 'Mr. Smith' belongs to that small number, and has made a creditable début. 'Mr. Smith' is by no means an ordinary production. . . . There are satisfactory, even delightful, bits—passages which one reads over and over again, sayings one would be glad to remember, traits of shrewdness and humor which strike one with a pleasant sense of their aptness."—*London Spectator.*

## *HARPER'S CATALOGUE.*

The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

BOSTON BOOKS.

## *Hamerton's Harry Blount.*

"The best boys' book since 'Tom Brown's School Days,'" says L. C. M. in the *Tribune.*

Price $1 50.

## *Our Sketching Club.*

Mr. Tyrwitt, the author of this book, is a pupil of Ruskin, and in the form of a narrative has given lessons in drawing, reproducing all of the cuts in Ruskin's 'Elements.'

Price $2 50.

## *Musical Composers and their Works.*

BY SARAH TYTLER.

"Lovers of music will heartily enjoy these bright and minute sketches of the great composers," says the *Literary World.*

Price $2.

## *A Paragraph History of the United States,*

From the Discovery of the Continent to the present time. With brief Notes on Contemporaneous Events.

BY EDWARD ABBOTT.

Square 18mo, flexible covers. Price 50 cents.

Of great value at this interesting period in our history.

Sold by all booksellers. Mailed, post-paid, by the publishers,

ROBERTS BROTHERS,
BOSTON.

## *The Bible Educator*

Is now complete in 2 vols., clo., $10; in 4 vols., price $3 each.

The work needs no recommendation other than the mere mention of a few of the contributors: The Dean of Canterbury (Payne Smith); The Dean of Chester (Dr. Howson); Rev. F. W. Farrar, B.D. (Marlborough); Rev. Dr. Vaughan (Temple Church); Rev. H. D. M. Spence, M.A.; Rev. W. Houghton, M.A., F.L.S. (Preston); Rev. Stanley Leathes, M.A., King's College; Rev. Geo. Rawlinson, M.A.; Major Wilson (Palestine Exploration); W. Caruthers (Botany Department British Museum); Jno. Stainor (Organist St. Paul's Cathedral). Edited by Rev. E. H. Plumptre, M.A.

*PROBLEMS OF LIFE AND* Mind. By G. H. Lewes. Vol. II. 8vo, $3.

*WHIP AND SPUR.* By George E. Waring, Jr. Saunterer's Series. $1 25.

A very interesting series of narratives of Field Sport and Army Experiences.

*SEX IN INDUSTRY.* By Azel Ames, Jr., M.D. 1 vol. 16mo, $1 25.

A companion volume to Dr. Clarke's 'Sex in Education,' and no less important.

☞ For sale by all booksellers. Sent, prepaid, on receipt of the price.

JAMES R. OSGOOD & CO., BOSTON.

Complete in Five Parts.

## *Smith's Historical Atlas.*

An Historical Atlas of Ancient Geography, Biblical and Classical. Compiled under the superintendence of Dr. William Smith and Mr. George Grove.

This magnificent and valuable work is now completed in Five Parts. It contains forty-two large and beautiful Maps and complete Indexes.

"The whole work is a splendid specimen of what can be achieved by learned labor and technical skill."—*London Athenæum.*

Price $7 per Part.

LITTLE, BROWN & CO., PUBLISHERS,
BOSTON

## *Fysshe and Fysshynge.*

From the 'Boke of St. Albans,' A.D. 1496.

BY DAME JULIANA BERNERS.

A copy of the English Edition of 1827 costs $82 to import. Price of the American Edition, 1875, heavy tinted paper, 12mo, cloth, $1 50.

The charming old work, reproduced in all its quaintness. Edited by a member of the New York bar.

Sent on receipt of price by

HENRY K. VAN SICLEN, Bibliopole,
No. 133 Nassau Street, New York.

*THE LAST IMPORTANT BOOK of anecdotes—the 'Reminiscences' of Macready, just issued by Macmillan—forms the subject of "The Reader's" remarks on page 304.*

# The Nation.

*NEW YORK, THURSDAY, MAY 6, 1875.*

## The Week.

IN selecting Mr. Edwards Pierrepont as Mr. Williams's successor, the President has made a fortunate choice, and taken a step in the reconstruction of the *personnel* of the Administration which was much needed. Mr. Pierrepont, if not in the first rank among lawyers, has a respectable standing, and brings to the office a great native shrewdness, long professional training, and skill in the management of causes. If he can manage to forget that there is such a thing as the stump, or that nominations for the Presidency will take place next year, he will, we have no doubt, do much to redeem the Department of Justice from the disgrace brought upon it by Mr. Williams. Under the latter's incumbency it may be said to have reached the lowest point of degradation to which the chief legal office of a free government could well fall. As Attorney-General, armed with powers never till within two or three years given to any American legal official, Mr. Williams wielded throughout half the country an almost autocratic authority, while apparently ignorant of the elementary principles of law, and having so low a reputation in his profession that he was actually forced by public opinion to withdraw his own nomination for the Supreme Bench from the consideration of the Senate. Obtaining his place as the reward of party service and using it for party ends, it would be difficult to imagine any worse illustration of the sort of contempt of decency and popular opinion that long-continued power breeds than is given by his case.

The cruel treatment of Pennsylvania by the President in the selection of Cabinet officers seems to be beginning to attract attention. During the six years of the present Administration, it is said by those who have kept a careful account of the actual changes, Pennsylvania has had no representative in the Cabinet except Mr. Borie, who was a short time in the Navy Department. New York has the Attorney-General and the Secretary of State, and yet New York is a Democratic State. Mr. Bristow is from Kentucky, and Kentucky is a Democratic State. Mr. Delano brings whatever strength he contributes to the party from Ohio, which is also Democratic. Mr. Jewell comes from Connecticut, which is also Democratic. The Secretary of War, Mr. Belknap, does indeed come from Iowa, which is a Republican State, but this is a small representation for the whole party. Pennsylvania, the great Republican State, without which the next Presidential election must certainly be lost, is treated with contumely and neglect; and it is suggested to the President that as soon as Mr. Delano goes out of office, he had better appoint as his successor a Pennsylvanian. We suppose, however, that the President has made up his mind that keeping States up to their work by giving them Cabinet offices is a mistaken policy. He tried it thoroughly with Massachusetts, made Judge Hoar his Attorney-General, gave the Treasury first to Boutwell and then to Richardson, keeping General Butler meanwhile as general counsellor and friend, in fact, recognizing and rewarding Massachusetts talents wherever they showed themselves. Nevertheless, it had not the slightest effect, and the State is now under a Democratic Governor. The opposite plan tried with Pennsylvania has worked like a charm, and if the President will take our advice he will not change it.

When Professor Marsh, of Yale College, was digging for fossils last fall in the deserts of Wyoming, surrounded by hostile Indians, and with the thermometer below zero, he furnished a good illustration of the enthusiasm and, possibly some might add, of the fanaticism of science. But if one of the secondary results of his expedition shall be to send a ray of light into the dark turmoil of "our Indian difficulties," that must be a very hard-headed materialist indeed who should begrudge a subscription to the next scientific expedition which goes in search of old bones. The exhumation of samples of the flour, sugar, coffee, and tobacco furnished the Indians doubtless gave a greater surprise to the Government agents than the fossils will ever give to the comparative anatomist. In one of the Professor's conferences with the Indians, Red Cloud, a noted chief of the Sioux, complained bitterly that the Great Father at Washington was not keeping his promises made to the tribe, but had sent out agents who cheated the Indians. Professor Marsh immediately offered to carry to the President any complaint which the Indians might make. Thereupon Red Cloud brought out from his tent the samples above-mentioned, and requested the Professor to take them to Washington and show them to the President. This the Professor promised to do, and recently, while attending the sessions of the National Academy of Sciences, obtained an interview with the President, and put before him the burnt coffee, the dark-colored flour, the inferior sugar, and the bad tobacco given him by Red Cloud. The effect of this simple action was most striking. The President was deeply impressed, and declared that justice should be done. Commissioner Smith was deeply impressed also, though in a different way, declaring, in substance, first, that the affair was a "put-up job," and that Red Cloud had "doctored" the articles given to Professor Marsh; second, that he already knew that the agent was not as good a man for the place as he could wish; third, that no agent could be honest on a salary of $1,500 per year.

The Board of Indian Commissioners, stirred by reports of the interview between the President and the Professor, held a meeting in this city last week, invited Professor Marsh to meet them at the Fifth Avenue Hotel, and requested him to address them on Indian affairs. He replied with their request, giving them an account of his trip, his interviews with the Indians, and the request of Red Cloud. Then, in answer to questions, he gave a talk upon Indian affairs in general; in which talk, it is safe to say, was compressed much information and good sense. Professor Marsh's statements derive additional force from the fact that he is not a professed philanthropist, reformer, or politician. He gives simply the result of observations which he could not help making at a time when he was attending to other and to him more important business. What the result of this agitation may be cannot be safely prophesied; but it is not possible to repress a wish that the entire control of Indian affairs might be put into the hands of Professor Marsh and a few other men of the like breadth of view, with full power not merely to decide all questions pertaining thereto, but also to purchase and distribute all supplies, perhaps also with absolute power of life and death over the members of any and all Indian Rings and conniving Secretary of the Interior and his immediate family within the recognized degrees.

Judge Kelley of Pennsylvania has just returned from the South, and has been giving an account of what he saw and heard. The Judge was chiefly struck, it seems, by two things: first, by the general prostration of industry; and, second, by the peaceful, sober, and almost civilized character of the population. No outrages, no murders, no rivers of blood, no deadly race-hostilities, no heaps of one-legged soldiers and Union men lying by the roadside with their throats cut from ear to ear, no half-interred corpses over which a flag was flying bearing the inscription, "This man voted the Radical ticket"—in fact, nothing but peace and quietness. The *Tribune* correspondent speaks of him as deeply regretting his vote in favor of the Force Bill, and stating his conviction to be that the only thing needed by the South for a revival from its present prostration is plenty of currency. The conversion of the Judge on the subject of the Force Bill is very gratifying, but we should like to know

what made him think two months ago that the bill was necessary, and why he should suppose that a tour of observation in the South gives him any right to an opinion as to the condition of the country or the temper of the population. We have always understood that the bloody outrages and murders committed by the Southerner were to be inferred from his known desire to exterminate the negro and the Union man. If the temper and disposition of the South are to be deduced from tangible, actual, visible facts, what is to become of the grand old party?

---

Nevertheless, we hail Mr. Kelley's conversion to the ordinary processes of reasoning on these subjects with satisfaction, and tender him the right hand of fellowship on all subjects save the currency. With regard to this, we must direct his attention to the condition of California, and ask him to apply to that State the rule as to the relation between the currency and the wealth of nations which he lays down with regard to the South. In the South, business is in a very depressed condition, and they have very little currency. It is easy to see that if they were supplied with currency by the Government, they would become rapidly prosperous. But in California they have no currency at all. The benighted population have steadily declined for fifteen years to allow the use of greenbacks as currency, and have on the contrary stuck to gold and silver. The hopeless condition to which the State is now reduced is shown by some statistics as to mining, agriculture, and immigration now going the rounds of the newspapers. For the first three months of this year the earnings of the Central Pacific Railroad were twenty per cent. above those of the corresponding period of 1874. The Western movement of passengers in 1874 for this period was 7,599; for 1875, 13,920; and the rush of immigration is now so great that the Central Railroad is taxed to its utmost to supply rolling-stock. The yield of wool, wine, grain, and tobacco promises to be enormous, and mining was never more profitably carried on than at present. California is, in fact, now the most prosperous part of the country. What it might have become with a really good, elastic currency probably only Mr. Henry C. Carey could tell us.

---

The difficulty of discovering the exact nature of the government of Louisiana, who carries it on, where it is, and whether its nature is that of an American State or a sort of Washington protectorate, does not seem to have altogether disappeared. The "Wheeler Compromise" is now generally admitted to be the fundamental law of the State, but what the Wheeler Compromise is, no two people seem able to agree. Referring to the action of the Louisiana Legislature in unseating some of its members just before its adjournment, we said that this was no violation of the Compromise, which only restored the expelled Democratic members and secured Kellogg from impeachment for past offences, and therefore did not prevent the Democratic majority from turning out other persons, if necessary and proper. The reason we said so was that Mr. Clarkson N. Potter, one of the Louisiana Committee, had publicly stated that, "so far as he understood, there was nothing in the arrangement by which the gentlemen who submitted their claims to the arbitrators were to be prevented, after being seated, from passing upon the right of any other person to a seat in that body whose claim had not been the subject of our [the arbitrators'] award." Mr. Potter said he had seen no copy of the agreement, and we certainly never had; but we supposed that he, if anybody, must know. The Boston *Journal* now informs us that we do not know what the Compromise is, and quotes from it as follows: "And that the House of Representatives, as to its members *as constituted under the award* of George F. Hoar, William A. Wheeler, William P. Frye, and Samuel S. Marshall, *shall remain without change, except by death or resignation* of members, until a new general election."

---

This certainly looks as if the Louisiana Conservatives had been guilty of sharp practice in unseating four members; but we understand their side of the case to be this: These four unseated Republicans were not on the original roll of the Returning Board at all, but were admitted without any pretence of an election whatever by the Assembly after the expulsion of the five Democratic members by the troops, solely for the purpose of getting a quorum. These four men had, therefore, nothing whatever to do with the legislature; their names were not on the list made out by the Returning Board and presented to the Wheeler Committee; and the roll of the Assembly is now precisely the roll of the Returning Board, as revised by the Wheeler Committee. We do not vouch for these facts; but certainly, if they are facts, Mr. Wheeler ought to come forward and state as much, and relieve a large number of Republican editors of the terrible anticipation of a rising of the Louisianians now preying on their minds. We must remind the Boston *Journal*, by the way, that all we originally said about the adoption of the Wheeler Compromise was, that it showed sagacity and moderation; and that the adoption of such a compromise proved that the Southerners were not such bloodthirsty desperadoes as they were painted. We never have maintained, nor should we for a moment think of maintaining, that Southern politicians are incapable of sharp practice. But, if their unseating these four members was a piece of sharp practice, it would only be an additional indication of there being no very great diversity of morals between one part of the country and another, and that the work of government is carried on in Louisiana by much the same sort of agencies as those which control politics in Ohio or New York.

---

General W. F. Bartlett made at the Lexington Centennial an excellent speech on the relations of North and South, and since his return to Richmond has been serenaded by a number of ex-Confederates headed by General Bradley Johnson, and made a second speech, which seems to have given his Southern audience as much satisfaction as the other did his Northern. No one has a better right than General Bartlett to speak in the interests of reconciliation and good-will, for no one during the war saw more or harder service on the Northern side, nor since the war has been in a better position to estimate the real temper and feeling of the best class of Southerners. Not being in public life, either, and having, it may be inferred from his speech last summer at Cambridge, a profound contempt for the average politician, what he says on occasions of this sort has a stamp of genuine earnestness which is apt to be wanting in the orations of gentlemen running for office. Notwithstanding this oratorical advantage, however, we must say that we regret that General Bartlett is not in public life. The reason is, of course, that he is not a sufficiently "practical" man, but thinks that government should be carried on for public objects, by men of principle and character. Men of this aristocratic and fastidious tone of mind never understand what the people want, and the Williamses, Delanos, and Shepherds seldom feel that it is safe to trust them with too much power.

---

A new liquor-law went into operation in Massachusetts last Saturday. The alternations of public feeling on the liquor question in that State, passing from prohibition to license, and from license to prohibition, almost with the regularity of the beats of a pendulum, furnish a striking illustration of the small extent to which legislation on many subjects is influenced by matured reflection upon relevant facts. The present is a "stringent license" law, so-called, and, in view of the fact that "the disaster and disgrace of a license law" would soon be upon them, the Massachusetts Temperance Alliance have issued an address to "the friends of our cause throughout the commonwealth." The spirit of the address may be inferred from the statements that "the liquor-shop is again to be an institution of the State"; that "lamentation is useless; nor have we any words to waste over the details of the law. When it fails, as it assuredly will, let its failure be accepted as the inevitable result of all such laws." After urging all prohibitionists to do what can be done towards the prevention of the granting of

licenses, the address adds: "Finally, having done faithfully the duties of the hour, let us fix our minds and hearts upon the repeal of this iniquity, framed into a law." So long as a considerable portion of the people of Massachusetts allow themselves to be swayed by the feelings begotten of an *à priori* theory upon the liquor question, it is idle to expect that any legislation whatever upon this subject will do much good. It may be said, however, that the new law goes into operation with the aid of the unusually favorable circumstance that the Governor of the State, the Mayor of the city of Boston, and a majority of the members of the legislature, really believe it to be a good law. So important a concurrence of opinion has not been known for very many years.

---

The State of Michigan has, unlike Massachusetts, adhered strictly to Prohibition for twenty years, and a clause in the State constitution forbids the introduction of a license system. The growth of population, however, and other causes have brought about a change of sentiment, and the State has now passed a law not licensing but taxing the sale and manufacture of spirituous liquors. Of course this is nothing but license in a different form but it is supposed that the law will not be obnoxious to the constitution. Meanwhile, a constitutional amendment has been prepared which will be voted upon in the fall of 1876, giving the legislature, entire control of the matter. It ought to be in the legislature's hands, and probably Michigan has been for the last twenty years a solitary, or almost solitary, instance of a community constitutionally prohibited from even allowing themselves to say what they would and would not drink. There is but a step from such a constitutional prohibition as this to one positively and affirmatively commanding the consumption of particular articles of diet.

---

We had no opportunity last week to speak of the German dinner to Mr. Schurz which succeeded the American dinner, and was at once larger and more in the nature of a demonstration, ending, as it did, in processions and a serenade, though it could not have been more hearty. Mr. Schurz has announced his intention of returning to Missouri and St. Louis, which is certainly a proof of his love of the West and his belief, shared by many other people, that even there his political "availability" will not be slow in reasserting itself. The German dinner was not intended to have any political significance, and therefore it is the more noticeable that after it was over a German address should have been presented, thanking Mr. Schurz for his services as a reformer, and promising that if he would, on returning to this country, come forward as a political leader, he might count upon the Germans following him. The newspapers generally have united in expressing the opinion that the honors paid Mr. Schurz were unusual and marked, but some of them seem to be unnecessarily alarmed as to its possible effect upon the minds and imaginations of those who offered them. We have seen a good many of the Germans interested in the dinner, and we can assure our contemporaries that though these gentlemen may not now be engaged in getting up a "third party," their movements will still be worth taking into consideration.

---

The public debt statement, published on the 1st inst., showed a reduction during April of $2,325,346. The coin balance is reported at $94,625,669, less $22,403,300 certificates of coin deposits in the Treasury. The total of $94,625,669 probably includes balances in the shape of called bonds in connection with the operations of the syndicate. The currency balance is reduced to the unprecedentedly low amount of $1,096,375. On account of this reduction in currency, the Secretary has ordered the sale of $5,000,000 gold during this month. His internal revenue receipts ought to increase during the month by reason of the heavy dues for licenses at this time of the year. Another call has been issued for $5,000,000 of 5-20 bonds, on which interest will cease August 1. This call was made at the request of the syndicate, who of late have been enabled to sell new fives in Europe, as the price has advanced above par in gold, and they have to pay for them 99½ in gold. Until recently, it was generally supposed that they paid the Government 99¾ for them. Perhaps the most gratifying feature of the public-debt statement was the reduction of $1,175,140 in the legal-tender circulation during April; it now stands at $378,051,760. In regard to the commerce of the country, the statement just issued by the Bureau of Statistics at Washington shows a decrease in the exports for the first eight months of the year (specie included) of $30,175,108 (mixed values), and a reduction also in the imports of $24,784,456. This means a general contraction in the volume of trade. The amount of goods in warehouse at the close of last February was $15,814,402 less than at the corresponding time in 1874; evidence that merchants have been drawing on stocks in port rather than importing new goods. The New York banks continue to gain legal-tender notes, and hold more now than, excepting the first week in February and the last in January, at any time since last November—an indication of prolonged ease in the money market. Another indication is that the amount of bank-notes in the hands of the issuers is steadily increasing. At the date of the last official return there were about $26,000,000; this virtually constitutes a reserve of circulation to be put out as required. In Wall Street, speculation has been tame, but all classes of investment securities have been strong.

---

The foreign offices of Germany and Belgium are still occupied in exchanging and comparing notes, with very little outcome thus far. As we remarked last week, this may be intended, on Bismarck's side, for home effect, or it may indicate a serious desire to coax or coerce neighboring states into a repressive, anti-Ultramontane policy like his own. There are obvious reasons why a constitutional Catholic state like Belgium is powerless to take part in any such combination, just as, in Italy, there is no disposition to do anything of the kind—for example, by repealing the law of the Papal guaranties, and making it expedient for the Pope to quit the country, bag and baggage. For their part, the Italians view their relations to the Papacy with entire complacency. They tolerate it in the midst of them with none of the alarm exhibited at a distance by Germany. They admit an identity of interest between the two countries as against Romanism, but deny the necessity of a common method of opposition. Bismarck they regard as merely following in the footsteps of Cavour, but rudely and violently. The Reformation drew the lines in Germany in a manner unknown in Italy, where, as has been said, the Renaissance made every cultivated Italian an impartial thinker, capable of comprehending and respecting the religious faith of others, so that all count themselves among the "faithful," while the believers are few; the believers attach no conditions to their faith, and the free-thinkers set no bounds to their argumentation. There is no motive, therefore, for joining in an active crusade against Ultramontanism, and, on the other hand, none for taking part with the Ultramontanes in a war against Germany, even if anything but a war of self-defence were not simply impossible for Italy as for Austria.

---

Nobody, surely, understands this better than Bismarck, whether or not he inspired the mischievous alarm lately sounded by the *Post*. He also knows, at least as well as anybody, that Cavour's milder manners are not suitable for Germany. There is no relaxation in pushing the new ecclesiastical laws for Prussia. The bill for the administration of Church property passed to a third reading on Saturday, and on the same day Dr. Falk introduced a new measure looking to the suppression of religious orders. This is to take effect in six months for the majority, in two years for those engaged in teaching; while those devoted to the care of the sick are made subject to the pleasure of the *Cultusminister*. The property of the cloisters and congregations thus dispersed will be used in pensioning the former members.

## THE INDEPENDENT VOTER'S PLACE IN POLITICS.

MR. EVARTS, in his recent speech at the Schurz dinner, stated the opinion of a great many men less able than himself when he said that notwithstanding, by the organization of our Government, all power is in the hands of the people, there might be an instrumentality able to "seize this power from the rightful possessors, and appropriate it to private combinations and to selfish ends." Mr. Schurz likewise expressed a similar opinion when he said that a large majority of the Republican party were sincerely and heartily in favor of reform, "but that they found themselves entangled in the network of organization, controlled and handled by a class of politicians who consider the advantages of power more important than the good of the country." From New Haven, also, we had just before received the lecture of Prof. Walker upon cumulative voting considered as a remedy for emancipating ourselves from the power of the caucus. That this subject—the dangerous power of the caucus—awakens the attention and calls out the thoughts of three such different men, living in three such different spheres of life, shows how rapidly it is becoming an important subject for the consideration of the American people. Here we have the leading member of the American bar, who is something more than a lawyer, being both a sagacious observer and instinctively a statesman, reviewing the actual situation, and asking how we shall hold out "to the younger men, the coming men, or the present men the idea that subserviency to caucus is not the sole prospect of American statesmanship." Here we have the senator who has risen highest in public estimation, and who has done so by the two simple methods of laborious self-culture and straightforward conduct, depicting with equal earnestness the dangers of this masked if not hidden power. Here, also, we have a professor of a university who has had unusual experience in life, ranging from active military service to the control of two important civil departments of the Government, lecturing to the students under his charge on the same insidious agency, and bringing his talents and experience to the solution of this simple problem: How shall the upright and intelligent majority manage to govern themselves? As Mr. Evarts very truly put it, "this is the problem of our time, and it is a problem which millions of our countrymen are now brooding on." A hundred years ago perhaps half a million were brooding on the problem as to how the American people should be secured in the right of taxing themselves as against the usurpation of an unconstitutional power. Now, that right having been secured to us, and to an extent which no man of that day could have anticipated, the question really is beginning to be, How shall we retain our rights, political and civil, as against the wiles of organized political fraud? In other words, having got rid of a king by a straightforward fight, now by what sagacious generalship shall we get rid of the caucus?

There are some considerations which will lead to the conclusion that the caucus is a natural product of existing causes, and as such, while they continue, cannot be readily overpowered or finally exterminated. In the first place, we have been living with a system which as a rule makes attainment of office easy, and removal from office practically impossible. We have no qualifications for office. A man need not own land, he need not be a householder, he is not subject to examination, it is not necessary for him to produce testimonials of character, he need not know how to read and write, he may be a drunkard, a gambler, a felon, provided only that he is twenty-one years of age and a resident within his district. In a word, we open the official door to its utmost width for all kinds of characters to walk unblushingly in. In the second place, we multiply offices to the utmost and in every conceivable way—by throwing the duty of selection on the people in the most paltry instances, by shortening the tenure of office, by "rotating" and turning men out without cause, and allowing every clerkship in the country to be changed with every change of politics. In the third place, we have confused and belittled the duty of selection by our "district system," in which we have singularly selected the smallest pattern for our area of choice, and our selection has borne the smallest fruit in the way of candidates.

In the fourth place, we have the most busy population—that is, the better and greater part of it—in the world; a population where the more energetic are not only trying to better their condition but to change it, where all men with activity of mind are intent on private ends, and where substantially none are content to live in the same house, and work in the same shop, and walk the same round that their fathers did before them. That is to say, we have a population possessing less time to spare for public duties than the well-to-do classes of a European nation. In the fifth place, we have an extraordinary and unprecedentedly large class of the ignorant and inexperienced, who, equally with the best of us, are entrusted with all the duties of citizenship. These are not only the "ignorant classes" in the ordinary sense of the term—the men who do not know how to read and write—but they are also foreigners, it may be with tolerable education, who have sought our shores ignorant of our laws and usages, and certainly ignorant of our public men. And, in the sixth place, with all of these materials at hand for a caucus, we have also the workmen in the form of professional politicians, whose trade it is to use these materials for their personal advantage, and to make their livelihood out of the country, sometimes by trading for office, sometimes by holding office, frequently by the dishonest plunder which office can distribute to those who are not actually in it. No one, we think, can review these causes without confessing to himself that, while they continue in full operation, the caucus will be inevitable, and the workmen will not stop laying their heads together because of anybody's denunciations.

There is one mode of dealing with the difficulty which every thoughtful citizen can put into operation at every election. Since we have the caucus as an established fact, directing our affairs, though much against our will, we can exact of it accountability. The principles of government which men not in office may unfold and spread before the people, can be dictated to the caucus as work which it shall not trifle with, and which it must perform. The old-time responsibility of party for the peculations of its creatures and the evils of its administration can be brought back, and as effectively fastened upon parties now as upon parties fifty years ago. The independent voter—that is to say, the conscientious citizen—though one in a hundred, has it in his power to put down the existing caucus, of whatever politics it may be, though he may not prevent another, less harmful, from taking its place. Is he likely to exert this power? We can answer this by saying that it must have been impossible for any one to listen to the speeches made last week at the Schurz dinner without being convinced that as an expression of political earnestness they had a deep significance. If Mr. Schurz had just reached the crowning eminence of a triumphant career as a public man, if he had just been re-elected to the Senate by a spontaneous union of all parties, or even if he had been leaving the country with a commission to some foreign court in his pocket, given as a solatium for political defeat, demonstrations in his honor would not have meant much. But appearing, as he does now, exiled from one party by his independence and principle, and repelled by the other apparently because it is too ignorant to recognize his value in public life, it is safe, in his case, to attribute marks of respect to a genuine admiration and hearty sympathy, and not to self-interest. The newspapers have generally dwelt upon this fact as the most important, and, wisely as we think, have noticed as of only secondary account the question raised by Mr. Schurz himself, whether means could not be found to organize in the support of their common principles those who are now roughly called "independent voters."

Much as we should have liked, at various times within the past four years, to have seen a third party in the field with a recognized head and known leaders, there are several reasons why at the present moment we can reconcile ourselves easily to its non-existence. Whether the thousands of voters all over the country who, as Mr. Evarts said the other night, are looking forward to the next Presidential campaign, in the hope that they may not have imposed upon them the duty of a "close mathematical calculation as to which candidate has the least defects," do or do not formally

unite, and do or do not explicitly offer their votes to that one of the two regular parties which shall put the best ticket in the field, is a matter of minor importance compared with the question whether there exists a large number of such voters in the country; and on this head there seems to be little difference of opinion. Both parties are now well aware that an indeterminate but considerable body of voters exists which is drawn over from one party to the other, not by recollections of the war or the stirring memories inspired by the Resolutions of '98, but almost altogether by the comparative merits of the men put forward by the two parties. To some people, a few years ago, this would have seemed a very shocking state of things to look forward to, as implying the sacrifice of interest in principles; but, in reality, it implies nothing of the sort, but merely that, in the existing rotten condition of parties, when both profess the same principles, and both are equally good and equally unreliable, the only sure foothold we can get for principles is in the character of the men who advocate them.

Now, when we come to consider the actual weight in politics of the independent vote, it must not be forgotten that there are two ways in which it can and does manifest itself—through the press, and at the polls. With its power at the polls every one is familiar. One of the commonplaces of political oratory to-day is the wonderful power shown in the rising of men of both parties against the Ring in this city, and there can be little doubt in any one's mind that the immensely improved condition of the Democratic party in this State; the capture of the organization, if we may put it so, by Mr. Tilden and his friends; the attack upon the canal men; and such nominations as were made the other day by Mr. Wickham for city commissioners, have all been directly due to the fact that for five years an unorganized independent vote has been held *in terrorem* over the heads of the politicians, and that they have had cause to feel for the first time in a long period that unless they made a good appearance, put their best men forward, and behaved like men of principle, they could never hope to regain their lost power. There is some evidence that a similar effect is beginning to be produced upon the minds of the Republicans by their reverses last autumn. The nominations made in Michigan the other day were exceptionally good, and the Republican ticket was successful; and, though we do not expect too much from the President, the substitution of Mr. Pierrepont for Mr. Williams, and the general renovation of the Cabinet that seems to be going on, show that somebody at least who has the interests of the party at heart is becoming aware that the autumn elections meant more than the usual Democratic reaction. It is in what the politicians call the "howl and clamor of the press," however, that there are the most constant and visible signs of the enormous change in public opinion which has taken place. The "independent press" has been much ridiculed, but the fact remains that the press is far more independent of both parties than it was ten years ago; and if the independence of newspapers is not a pretty good test of the independence of the public, we do not know what is. It is a notorious fact that among the leading newspapers of this city there is hardly one which can be considered the actual organ of either political party, in the sense of supporting the party's proceedings through thick and thin; and it is, of course, the sheerest nonsense to imagine that at the political and commercial centre of the country the press can go on publishing articles which reflect no one's opinions but the editors'. Few know better than an editor how necessary it is for the press to keep itself in the current, and indeed subserviency is almost always the vice which (though he may damn it) he "has most mind to." For these reasons, we find in the present either critical or hostile attitude of the leading part of the press toward both the parties the clearest proof that political independence is a real thing.

Is that independence, however real, likely to have its due effect in politics without an organization, a union? is the question which is no doubt troubling many people. As to this, we have one suggestion to make which we are satisfied is worth the consideration of everybody—that an independent body of voters ceases to be independent the moment it becomes organized into a party. This lesson was sadly learned at Cincinnati, and the remembrance of it probably deters many reformers from even the hope of repeating that experiment under more favorable auspices. There is, too, in the eagerness of the poorer sort of politician to ally himself with some new organization as soon as he has left an old one, the exhibition of a spirit which is hostile to independence itself. What has been for a long time chiefly needed in this country has been the creation of a new political atmosphere, in which men might hold and express political opinions which did not bear the stamp of any regular party die. The only way this can be done is through the existence of a body of independent men, who cherish first their own opinions, principles, characters, and moral code, and secondly, and even with reluctance, are willing to merge their individuality in movements for some public end which they recognize as good. We have had enough of statesmen whose utter oblivion of self and devotion to the common weal went so far as to include an oblivion of conscience, character, truth, and honor; what we want now is the knowledge that there are throughout the country a number of men ready to act together when it is necessary for the public good, but who stand meanwhile on their own legs, supported not by a platform or a party, but by their own strength of opinion and conviction. These are the dangerous people in any country to public jobbers and wire-pullers. These are the people whom they cannot count upon or understand. Give them an organization, a platform, a ticket, traditions, places to fill and empty, and they become like any other force in the political world, to be bargained with, bought, sold, and "captured." But without any organization they exercise an influence on both parties which is not measured by their numbers, and really create, for the time being, "party responsibility." There is no need, in the face of these facts, to give ourselves much trouble as yet about the campaign of 1876. The best thing the independent voter can do is to continue being independent, voting for the best men he can find to vote for, saying what he thinks, and not making himself over anxious as to what organization he belongs to. If he perseveres in this he will, we feel confident, compel the nomination of good candidates by both parties, or, if not, will at any rate occupy an honorable and self-respecting position which he will never have reason to regret.

## A REACTION IN INTERNATIONAL LAW.

TWO congresses for the modification of international law are to be held this year—one at the Hague and the other at St. Petersburg. The latter is an adjourned session of the congress which met last year at Brussels, and has in charge the consideration of the possible mitigation of the horrors and calamities of war. The other, having at its head a number of well-known American gentlemen—among others Dr. Woolsey and Mr. D. D. Field—is to discuss the feasibility of a "proportional reduction" of the armaments of great powers and the regulation among nations of the use of war, with a view to making it more difficult to begin; as well as other important but not closely related questions, such as that of the prevention of collisions at sea. What Russia desires to do about the horrors and calamities of war we had the opportunity of learning last year. She desires such a modification of international law as shall make war simply a mortal struggle between the regular forces of contending nations, and put all irregular fighting on the level of piracy. It has been pointed out very distinctly that this change would be solely for the benefit of the large military powers of Europe; for it would in future absolutely ensure victory to the "heaviest battalions"—this, of course, being Russia's object in introducing the change. A real improvement of international law has never been ardently desired by Russia, and indeed Prince Gortchakoff, who has not usually appeared in the rôle of a philanthropist, at the time of the Brussels Conference expressed strong doubts as to there being any obligatory international rights of any sort, except under treaties; and Prince

Gortchakoff's opinions as to the binding nature of treaties may be inferred from the manner in which Russia has observed the stipulations of that made at Paris in 1856, neutralizing the Black Sea, which, in 1870, she declared *sans façon* to be no longer binding, and has never since paid any attention to. With regard to the meeting at the Hague, we suppose that few people can expect it to succeed in reducing to any considerable extent the number of troops in Europe, nor in limiting or restraining what is perhaps the most cherished right of sovereign states—that of selecting the time and occasion for making war. The choice of reasons for making an attack, and the time selected for it, are of such immense importance to any nation, and count for so much in the chances of victory, that this, of all rights of sovereignty, would seem the last likely to be abandoned.

We would not be understood, however, as deprecating the Hague Conference or the discussion of international law in congresses or conventions; for, as it rests really not, as Prince Gortchakoff supposes, mainly on treaties, but on the general agreement of opinion among civilized nations, there is no kind of law which so much or so continually needs discussion or gains so little by silence. But there are a great many ways of discussing international law; and philanthropists just now seem to have formed a tacit league to discuss it in only one way, no matter whether their discussions come to anything or not. The direction in which they have for the last few years steadily directed their attention has been that of putting an end to war either by a general covenant to keep the peace, or by throwing legal or semi-legal obstacles in the way of it. In one sense, they have no doubt made an impression. Notwithstanding the present large armaments of Europe and the wars of the last few years, there can be no doubt that there is to-day, at least throughout that very important branch of the human race which speaks the English language, a more general recognition of the value and duty of peace than at any former time; and if there were in the world no other language spoken, and no other interests at stake than those of England and the United States, it might still not be utopian to indulge a dream of universal peace—not millennial, perhaps, but at any rate of long duration. But while this feeling is very strong, at least as regards our own race, the general attitude of mankind towards the body of customs and opinions which we call international law is quite a different thing; and it is to this that we wish the philanthropists would give a little closer attention.

Open any modern book on international law, and you will find that the most striking characteristic of modern as distinguished from ancient society is, that the law of nations contemplates as the normal condition of the world a state of peace. Till within two or three centuries war was regarded as the rule, peace as the exception. It follows from this, of course, that the interests kept constantly in view formerly were those of belligerents, while the interests which in modern times have taken the first rank are those of neutrals. Even in the time of Grotius, neutral interests were of so little importance that writers on the law of nations could almost overlook them altogether; now they make perhaps its most interesting chapter. This is a very commonplace fact; but when we reflect that the growth of neutral at the expense of belligerent rights is simply another name for the growth of the interests of peace at the expense of those of war, we see the close connection which has existed between the tide of philanthropic opinion distinguishing modern society and the current of international custom itself. The long peace, which lasted almost unbroken in Europe and in this country from the end of the Napoleonic wars to 1854, gave an opportunity for the growth of more and more humane opinions on these subjects, and when, at the close of the Crimean war, another era of peace seemed opening, we find in the Declaration of Paris a formal adoption by the Great Powers of the highest and best canons of international law affecting warfare among civilized nations—the abolition of privateering, the principle of the protection of enemy's goods by neutral flag, the exemption of neutral goods even under an enemy's flag, and the rule of effective blockades. This Declaration was signed by Russia, England, Austria, Prussia, Italy, Turkey, and other powers, while the United States objected to the abolition of privateering, but offered to agree even to that, provided all private property should be exempted from seizure by public armed vessels, except in the case of contraband of war.

That the gradual growth in international law of neutral at the expense of warlike interests, down to the time of the Treaty of Paris, was a movement in the direction which all philanthropists and reformers should wish to move, can hardly be disputed. Nevertheless, from that day to the present, while philanthropic and reformatory public opinion has been clamorous for a total abolition of war, there has been, not indeed a concerted, but by no means an accidental movement on the part of some of the most powerful nations in a direction opposed to the whole previous course of modern history, and distinctly against neutral or pacific in favor of belligerent rights. The United States, which in 1856 was dissatisfied with the Declaration of Paris because it did not go far enough, was the first to manifest a reactionary tendency, and, in the war with the South, being for the first time a belligerent on a grand scale, and forgetting its traditional policy as a neutral, began to invent strange theories as to the obligations of neutrals in time of war, which were finally formulated in the "three rules" laid down at Geneva, and which have left the duties of neutrality in such a vague and at the same time dangerous condition that it is absolutely impossible to say exactly what they mean, or what new obligations they impose. It is obvious enough that rules of this sort are all for the advantage of belligerents, since their very vagueness and uncertainty have always a tendency to drag the neutral into the quarrel on one side or the other. The next significant attack on neutral rights was made by Count Bernstorff, who invented, on behalf of Prussia, the doctrine of "benevolent" neutrality, and tried, without success, to induce England to believe that it was her duty to act the part of benevolent neutral as between Prussia and France. The attempt failed, but it was made, and there is no reason to believe that we have heard the last of it. Finally, in England, of all places in the world, a member of Parliament has now seriously proposed (and secured in support of his proposition a vote sufficient to ensure continued discussion) that England shall withdraw from the Declaration of Paris and formally abandon the principle of "free ships—free goods." The debate which took place in the House of Commons on the motion is instructive, as showing the existence of a number of people in the great neutral and commercial state of modern times who have so far forgotten recent history, and are so ignorant of the true position and interests of their own country, as to demand an increase of belligerent at the expense of neutral rights.

We have no desire to take a pessimistic view of the subject, and we do not mean to say that these instances are more than indications of a possible reaction in international law—not a demonstration that such a reaction is unavoidable. Indeed, to believe this, it would be necessary to believe, not merely that the leading countries of modern Europe mean to keep themselves in a state of readiness for belligerency, but that they expect to be generally at war; that we are entering upon a new period of barbarism; and that peace is hereafter to be the exception. This we do not say; but it is important not to overlook the fact that the improvement of society, the amelioration of human affairs, and the interests of general peace, are from the point of view of the international philanthropist closely bound up with the rights of neutrals; that down to the time of the Declaration of Paris the development of international law was marked by a steady development of these rights; and that the increased belligerency of the world during the last twenty years indicates a danger of a barbarous reaction in an opposite direction. The abolition of war may be dismissed as a dream; but it is no dream to hope that in the future, as in the past, the two great nations whose interests are bound up with the peace of the world may not be led astray by visions of an impossible perfection from a path which has been hitherto one of steady and remarkable progress.

## SHALL I BE EXPATRIATED?

BERLIN, April 6, 1875.

I PUT this question in the first person singular simply to give clearness, directness, and emphasis to a case which is the cause alike of all true Americans sojourning abroad. Though Judge Hoar's bill, defining the status of citizens of the United States in foreign countries, failed of definite action in the last House, the Administration is likely to press upon the next Congress some legislation on the conditions under which Americans residing abroad shall retain their citizenship; and, considering the important and delicate interests to be affected by such legislation, the way for it should be prepared by timely and judicious discussion.

With the main purpose of Judge Hoar's bill I fully agree; and, indeed, no one can reside for a time in Germany without feeling the necessity for some such legislation as is therein contemplated. In time of war, as I witnessed here in 1866, Germany swarms with returned emigrants, largely of the Jewish type, who plead their American citizenship in bar of military service to their Fatherland. Now that the latest treaty between Germany and the United States has reduced the risk of such service to a minimum, this class of American citizens is prolific in expedients for evading the fourth clause of the treaty, which provides that "every naturalized subject, who, having no intention of returning to the country of his adoption, resides continuously during two years in his former country, is presumed to have renounced his naturalization." So far as this class of citizens is concerned, Judge Hoar's bill would simply embody in the form of a law of the United States what is already provided for by the Treaty of 22d February, 1868, between the then North German Confederation and the United States. My objection to the bill in its present form is, that it includes in the same condemnation native-born citizens, against whom no presumption of renouncing their citizenship in the United States can lie.

The class of persons who ply between Germany and the United States in a way to dodge their obligations to either, and who take up or renounce citizenship at will for their own interest or convenience, is constantly increasing, and the claim of American citizenship is often used as a cover of some iniquity or a protection against some obligation abroad. No doubt some native Americans, too, make a mere convenience of their citizenship to evade responsibilities or shield irregularities. The Government of the United States is bound to protect itself against this abuse of citizenship; and it was with a view to a clear definition of the status of such persons that the President, in August, 1873, sought the opinions of the several heads of Departments upon "the relations between the Government and persons who may claim its protection as citizens of the United States," and that he afterwards brought this subject before Congress in his annual message. Judge Hoar's bill is the proper sequel to this movement of the President and his Cabinet. But it should be borne in mind that the Government has largely brought upon itself the evil which it now seeks to remedy by special legislation. The Treaty of 1868 with Germany was more in the interest of demagogism at home than of international comity. To catch the German vote, the United States secured an important relaxation of the German rule of military service in favor of actual or intending emigrants to America; and the consequences of this the United States is now reaping in over-stimulated immigration and in the perversion of citizenship to mean subterfuges that plague the American Legation and Consulates in Germany, and disgrace the American name. So far as Judge Hoar's bill is a remedy for this evil, I would hold up both hands for it, as indeed I would for a remodelling of the Treaty of 1868. But I protest against the phraseology of the bill which would put me in the same category with impostors or indifferents, and would expatriate me upon a groundless presumption.

In Section 3, the bill describes the persons who "shall be regarded as not subject to the jurisdiction of the United States"; and among these specifies "citizens who may be domiciled abroad, unless registered as hereinafter provided." Section 1 declares that "the words *domicile* and *reside* are to be construed as implying a fixed residence at a particular place, with direct or presumptive proof of an intent to remain indefinitely." Section 3 declares that "citizens of the United States, of adult age, who shall remain out of the jurisdiction of the United States, and within the jurisdiction of some other power, continuously for two years, shall be held as *domiciled* in a foreign country, except as hereinbefore provided"; and this last clause refers to the requirement that the American citizen residing abroad, if he desires to retain his citizenship, shall register himself at the Legation of the United States, or at a Consulate, once in every two years, declaring in writing, among many specifications, "*whether he intends to return.*"

If I rightly interpret this, the mere fact of residing abroad in the same country for two years is construed as being "domiciled" in that country; and he who is thus domiciled ceases to be constructively "under the jurisdiction of the United States," unless he shall be at the pains of going to some official and declaring in writing his "intent to return." The plain inference is that if one cannot say positively that he intends to return to the United States his registration would avail nothing, and he would forfeit his citizenship after a two years' residence abroad, or after any subsequent term of two years. This is the clear intent of the fourth section of the German Treaty of 1868, after which Section 3 of Judge Hoar's bill is modelled; a returned emigrant who has no intention of going back to America as his home, is held to have renounced his American naturalization by a continuous residence of two years in Germany. There is a fair ground for this presumption in the fact that such a person has willingly returned to the land of his nativity. But no such presumption should apply to the American who is away from the land of his nativity, and has taken no steps toward naturalizing himself in the country where he resides.

Now, to what end should he be required to declare his intention to return, unless the want of such intention is to work a forfeiture of his citizenship? Unless every two years he can declare that intention, he is held to be domiciled abroad, and is expatriated *nolens volens*. Hence I protest against this feature of the bill, as false in principle and vexatious in its application. It is false to assume that an American, through a foreign residence, declines in the fervor of his patriotism and needs to have this revived by a prescribed visit to the American Legation or Consulate to register the fact that he wishes to continue an American; it is false to assume that one undervalues his nationality through lapse of years in a foreign land, and must be goaded into remembrance of his birthright by an official threat of expatriation, to the prejudice of his heirs; it is a false principle that would make the retention of a birthright, which one no more thinks of relinquishing than of parting with his name, to depend upon the punctual performance of some petty formality which he might at any time forget; it is a false principle that would make the country forward to ostracise her own sons, who are spreading her name and fame abroad, and who would die sooner than renounce her; it is injurious that the country should deprive herself of her just part in the fame of her cosmopolitan sons, by wantonly expatriating them for failing to make a written declaration that they "intend to return" in person to lay their service and their honors at her feet; and, above all, it would be the height of absurdity for a country that has sought by treaty to release the subjects of a foreign power from obligatory military service, to subject the sons of her own citizens to military service to that same foreign power, by expatriating their parents.

The case will appear more vivid and precise in the concrete. Residing abroad, not of choice but of necessity, being ordered by physicians of New York, London, and Berlin to keep aloof from the exciting atmosphere of American life, I surely cannot declare "whether I intend to return" to the United States. I have resided "continuously" in Germany for more than two years, and my library and house-lease are "presumptive proof of an intent to remain indefinitely." But nothing could induce me to transfer my citizenship to Prussia, though advantageous overtures on that point have not been wanting. To the best of my means and ability I have improved every opportunity for advocating or defending the United States in face of German ignorance and prejudice; and there is more of this sort of work in view for the Centenary. The private citizen abroad may say things through the press and from the platform that are forbidden to an official representative of the Government; and we privates flatter ourselves that we do more to cause our country to be respected in Europe than do some of the leaders at home.

The advocates of Judge Hoar's measure will say that all laws must be framed in general terms, without regard to exceptional cases. But Congress has no right, for a general purpose, or simply to avoid circumlocution, to enact a law which by its terms would deprive of his birthright any native-born citizen, innocent of crime. No general phraseology should cover a specific injustice.

It will be said again that registration would be no more unjust nor annoying than the present system of renewing passports. But there is a radical difference in principle between the cases. The passport is simply an *evidence* of citizenship, to be used in case of need against foreign governments; whereas the proposed registration would touch the *fact* of citizenship, and would require the citizen to establish and maintain that fact against a law of his own government which through his mere forgetfulness might deprive him of it. And registration would not save him without "intent to return."

It will be said that if one prizes his citizenship it would be no great hardship to go and register his claim. In many cases, however, where there is no resident consul, this would be a hardship; and the real hardship

lies in the presumption of the bill that one does not value his citizenship, and the requirement that he shall formally renew his claim every two years or forfeit his citizenship, and need to be rehabilitated. The hardship lies in the fact that a government which throws out its drag-net over all peoples, and sweeps in multitudes of all sorts to be naturalized as voters, should expatriate its true native-born sons for the accident of residing abroad, unless they shall swear to an intent to return. If they cannot swear this, they are cast out of the protection of their country—one of the greatest hardships a true patriot could suffer.

My heart yet thrills with pride at the tribute of Bismarck to my country when he said that no foreign power would dare offer to a citizen of the United States the insult that the Carlists had offered to a German. He would bring Germany up to the noble standard of the United States in caring for her sons. Yet, by this bill, I might be dropped here in Germany, and find myself "a man without a country." No; the thing is absurd and impossible. My citizenship was not derived from the Fourteenth Amendment, and cannot be touched by any legislation based upon the phraseology of that Amendment touching "jurisdiction."

I deny the power of Congress to expatriate me, and I deny the right of Congress to throw upon me the *onus* of proving and retaining my citizenship. If need be, I would contest this before the Supreme Court, and, if defeated there, would still live an American, and die with the proud satisfaction that I had been more faithful to my country than she to me.

J. P. T.

## M. LE PLAY.—THE FRENCH LAW OF SUCCESSION.

PARIS, April 9, 1875.

FRANCE has often been in need of reform, but never of reformers. Among those of the present day, one of the most original and the most interesting is M. Le Play. He is no ordinary man. Educated at the Polytechnic School, he became a state engineer of mines. He spent several years in the Ural Mountains, in some gold-mines belonging to Prince Demidoff. He returned to France to become a professor of metallurgy at the School of Mines, and under the Empire he was made a councillor of state. I need hardly add that he was the president of the Commission of our great Exhibition. He has been in contact, during all his life, with manufacturers and employers of labor, as well as with laborers, and he has taken a keen interest in the study of the peasants and of the workingmen in all the districts which he has visited. He entered into his studies with a truly scientific spirit. He studied the social state of the working-classes as minutely and as carefully as a naturalist. He did not start from any general principles, but tried to extract some principles from a great collection of facts.

It is a pity that M. Le Play is not a good writer. His style is cumbersome, ponderous, and fatiguing; yet, notwithstanding the absence of all art in his works, his book on 'Social Reform in France' has already had several editions, and has attracted the notice of all those who are not contented with a superficial view of history. For the living forces of history are only the outward expressions of the hidden forces which are constantly at work in a society. M. Le Play does not belong to what I may call the Revolutionary school; he has studied the past of France as well as the present, and he has no unlimited faith in the famous declaration of the rights of men. The preparation for the 'Social Reform in France' is to be found in two great works, one called 'The European Workingmen,' the second 'The Workingmen in Both Worlds.' In the first he has described, in the most minute details, the condition of thirty-six families of laborers, examined their budget, and shown their relations with their superiors in society. The 'Ouvriers des Deux Mondes' is the work of a society of which M. Le Play is the president, and which publishes monographs concerning laborers in various countries and conditions.

M. Le Play's chapter on property has attracted much attention in France. He maintains that the best form of property, the most likely to promote social progress, is the free and individual possession, debarred from any servitude. There are now in some countries, and there have been at all times, other modes of property, but the laws of succession, in their immense variety, can be brought under three heads: 1st. Conservation can be forced by law. Such is the case wherever there are strong traditional feelings, and the system may work well as long as virtue is transmitted in the blood; but when the stock of the original possessors becomes corrupt, the system becomes intolerable. 2d. Partition can be forced by law; this is the régime proper to the countries which are imbued with a revolutionary spirit, adverse to tradition. The system is a reaction against the abuses of privilege; it is the system enforced in France since the Revolution of 1789. 3d. Testamentary liberty is complete. This system characterizes the countries where liberty as well as tradition is respected, and where the individual will is not subservient to the state or to privilege. This last system has the preference of M. Le Play; and he is a bold man who dares to confess in France that the father of a family ought to be completely free in the disposition of his property. The reaction against the right of primogeniture of the old régime is not yet exhausted, and the intense love of equality which has taken possession of the French mind has completely destroyed the old Roman notion of the *paterfamilias*. The law of succession in France has passed through all possible stages. Under the domination of Rome, the testamentary liberty was complete in the southern provinces, which had been the first conquered. In the north, Rome allowed the traditional and Germanic habit of partition between the sons. After the invasion of the Franks, the crown domains themselves were long considered as capable of division. The whole history of France may be said to be the struggle of the Latin ideal of government and legislation with the Germanic ideal. The *coutumes*, which are the collections of local laws made after the Middle Ages in all parts of France, are more or less Germanic, or more or less Latin, according to the latitude and sometimes according to the character of the feudal chiefs of the provinces. The archives of our notaries contain the elements of a new social history of France. I have myself studied the *coutumes* with great attention, and tried to form a correct opinion of the state of division of the land in France before the Revolution. The subject is very difficult and very obscure. It was the opinion of Tocqueville that land was already much divided in France before the Revolution. M. Le Play does not throw any new light on the subject. He contents himself with regretting that after the reign of Louis XIV. the noble families became impoverished; the great estates were divided in consequence. By the ordinance of 1747 no entails were allowed for more than two generations. The right of primogeniture has never been in France what it is in England; it only applied to what was called the manor and the *vol du chapon*—that is, land round the manor, limited by the extent of the flying of a cock. The rest of the land was subdivided; the oldest son had only a variable fraction of it, according to the *coutume*. It happened, therefore, that younger sons often had a bit of land without a manor. When they lived on it, they built a small house and ran in debt; when they were in the army or the church, they let it out; and this land, losing its feudal or noble quality, became *roturier*, even though it belonged to a nobleman, and *roturier* land ceased to be submitted to the law of primogeniture. It is easily understood that, under such circumstances, land became divided in all the countries where the *coutume* had a Germanic origin and where the habit of entails and of wills did not prevail. It is a curious fact that under Louis XIV. very few wills were made; the resident proprietors had their rights more and more reduced by the intendants. The aristocracy had in reality lost its social importance to a very great extent when the French Revolution broke out.

The first law on the subject of succession was passed in 1791. It instituted complete equality between all the sons and daughters, and destroyed all the distinctions established by the local customs between movable and immovable property, patrimonial estates and acquired estates, etc. All entails were strictly forbidden, under threat of confiscation. In 1793, a decree was passed which abolished the right of making a will in the direct line. Not only did the sons and daughters become the equal heirs of their father and mother, but all the descendants of the same degree had their formal rights to an equal division of the property of their ascendants. Under the Empire, there was a slight reaction against this tendency. A law of 1803 (29 Germinal, year xi.) fixed the rules of succession as they have been in force ever since. It excluded the bastards, whom the French Convention had admitted on the same footing as the legitimate children; it allowed the testator to keep the disposition of a variable part of his property. This portion becomes more and more reduced as the number of the children gets larger. It is equal to one-half of the property when there is one child only, to one-third when there are two, to one-fourth when there are three. The freedom of the father becomes, therefore, more and more nominal when his family increases, and this is undoubtedly the reason why there is a marked tendency in France towards the limitation of the family. Every time a father has a child more, he knows that his power of disposing of his fortune becomes smaller. The law has left him free to use this variable part (it is legally called the *quotité disponible*) as he chooses; in this respect, his freedom is unlimited. He can leave it to his wife, or to his eldest son, or to any other child, or to a perfect stranger. The only remainder of the old habit of entail is this: a father may leave the disposable part to a child with the provision that it must be kept for his heirs, giving him only a life-interest, while all the rest of the property becomes immediately free and

individual. The law is, however, so jealous of equality that this life-interest cannot be transmitted to one child only—it must go in equal parts to all the heirs of the second generation. This law of succession, which is a very original one, is not well known out of France, though it has now been in application for half a century. It has had the most important results, and the political philosopher may almost see in it the principal cause of the present state of a country which is half revolutionary and half conservative. The love of property is intense in all classes, but it accompanies a continual desire to break up settled estates.

It is hardly worth while to speak of the law of the Empire which re-established entails, under certain conditions, for the great dignitaries of the state, under the name of *majorats*, as this law was abolished by the Revolution of July. Practically, of course, great efforts are made towards the preservation of some estates, but these efforts only produce ruin in the end. Let us take, for instance, an historical estate like the Broglie estate in Normandy. The present Duke kept the castle and as much as he could of the land; he received the benefit of the *quotité disponible;* but he had sisters, and he was obliged to indemnify them by selling many farms. He is himself the father of five children; when he dies, the eldest son, the Prince de Broglie, will undoubtedly keep the château; but he will have to sell more farms to indemnify his younger brothers. After some time, when marriage does not bring much money into a family, the largest estate must become reduced to an expensive manor-house. In the year 1865, a proposition was made in the French Corps Législatif towards the establishment of a new régime, but the principle of testamentary liberty was only supported by 41 deputies against 197. M. Le Play is a strenuous advocate of this liberty, and he considers that this measure alone can give to the family the character which it ought to preserve, and which it has lost for a century. The relations of husband and wife are not satisfactory, in his opinion. The law allows two modes of relation—when no contract is made, everything is held in common, but the husband becomes the only administrator of the fortune, even of the part which was brought by the wife. The contract system is most generally employed among people who own some property; in M. Le Play's opinion, it diminishes the moral sense of the population. It consists essentially in this: the dower forms a property the fee-simple of which is not possessed by the husband and the wife, but is reserved to the heirs, either the heirs-at-law or the heirs named beforehand in the contract. Under the contract régime, what constitutes the dower cannot be sold or exchanged or increased without difficult formalities. To propose to your son-in-law to make a contract is to tell him that you do not consider him capable of administering the dower of your daughter. The law does not even give to husband and wife, after a long term of years, the right to change in unison the provisions of the contract; it is binding for a lifetime; and there is no provision like that which allows two parties in England to break an entail.

Marriage in France no longer exhibits the disorders of the time of Louis XV., and there is much morality in the French bourgeoisie; but M. Le Play does not consider the institution, as it is now established, as perfect. The majority of men are obliged, he says, to ask from their wives the fortune which their brothers and sisters have taken away from them. "This calculation is founded upon such ingenious motives that public opinion sees in it a mark of wisdom; and those who marry girls with the greatest accomplishments, but without fortune, seem to give a proof of imprudence or to acknowledge their own inferiority." I do not accept this judgment without reserve, but it is true that the consideration of the dower has become somewhat too important, that calculations are too openly made on what are called the *hopes* (*espérances*)—that is, the future successions which will come to the young ladies. Marriage is, in a measure, too subordinate to questions of interest; but, in one form or another, the same may probably be found everywhere. A long sojourn in England has convinced me that a girl with a good fortune knows her advantages there as well as she would in France.

The work of M. Le Play is very suggestive: it is rich in details and original views. I have only pointed to the questions which seem to me to have the most practical bearing. The French law of succession needs amendment, and I believe that M. Le Play has not exaggerated its importance in a social point of view.

# Correspondence.

## SECOND STAGE OF WISCONSIN RAILROAD LEGISLATION.

To the Editor of The Nation:

Sir: The first letter with the above caption, over the initials "F. R. L."—in which signature there was a typographical error—called down upon its writer a small storm of abuse, which, though vehement enough, has hitherto been entirely vague and general. Now, however, Mr. Commissioner Hoyt comes out with a charge of misrepresentation and falsehood so specific and grave that I am sure you will allow me to reply.

I read his charge with some amazement, for the statement which he quotes was the last one which I should have thought any one conversant with the facts would venture to deny. The Commissioners' bill was explained both to the Senate Committee on Railroads and to the Lower House by the Commissioners themselves. In each case, Mr. Hoyt took up the bill section by section, and explained its provisions. In each case, Commissioner Joseph H. Osborne followed with remarks of a more general character, the drift whereof was that, in pursuing their enquiries and in framing their bill, the Commissioners had aimed to contribute something toward the establishment of a system of legislative control which would not be confined to Wisconsin nor to railroad corporations alone, but which should become national and extend to all corporate capital. This idea—of course I do not pretend to quote the precise language—was elaborated by Mr. Osborne at some length, and received from Mr. Hoyt, the only other member of the board present, the endorsement of silence, which was construed to mean approval. After first hearing this somewhat significant idea advanced, I conversed with several gentlemen who had been present, who fully confirmed my belief that I understood him correctly. Subsequently I met Mr. Osborne, and, in the course of a conversation on the subject, he restated their—or at least his own—position to the same effect. I cannot think that I misunderstood him. As corroborative of this conviction, it may be mentioned that he began this portion of his remarks by saying that I, being engaged in banking, would not be likely to look kindly on such a system, nevertheless, etc., etc.

Of these repeated statements I gave the version that Mr. Hoyt quotes, viz., "that the Commissioners stated, not only in the Assembly, but before the committees and privately, that their bill was intended as a step towards the inauguration of a system under which the earnings of capital should be regulated by legislation." I had warrant for saying this. I have seen no reason to modify it. If it be worth while, I desire to reaffirm it as emphatically as may be.

The relative values of this affirmation and of Mr. Hoyt's courteous denial are of no sort of consequence, as Mr. Osborne's remarks were made so publicly that the truth or falsity of my assertion concerning them need not become a question of veracity between Mr. Hoyt and myself.

Very respectfully, E. R. Leland.

Eauclaire, Wis., April 27, 1875.

## TACTICS OF BOOK-CANVASSING.

To the Editor of The Nation:

Sir: In spite of some manifestly objectionable features, the trade in subscription-books appears to be increasing rapidly in magnitude and importance. It cannot escape attention that there has been of late a vast improvement in the quality, literary and mechanical, of works published and circulated by subscription. Our most respectable publishers have thus issued some of their most important works. Yet there is great opportunity for abuse in the hands of enterprising publishers and unscrupulous canvassers. It will do no harm to subject their methods of operation to close scrutiny. I believe these facts will justify the following statement.

Looking over a small volume of 'Instructions to Agents,' issued by a firm publishing some subscription-books of much merit, I find these among other directions:

"*Always secure the most influential men first. Never fail to do this, as your success depends wholly upon it. If in no other way, get them conditionally—i.e.*, have them sign your canvassing-book, even if on condition that they may take the book or not when you come to deliver it. . . . The getting of *leading names* is the GREAT TURNING-POINT OF SUCCESS IN CANVASSING. . . . The INFLUENCE OF EXAMPLE is of incalculable advantage to the canvasser. . . . If any of these leading people are unable to buy or assist as a helper [*sic*], then ask for their names to head your list for the sake of their INFLUENCE; the *condition* being that they are at liberty to take the book or not, when you bring it. . . . The object is to get their names to head the list, and, having thus got well started, the thing will go like an epidemic."

I have reason to think that similar instructions are given by some other publishers. The object seems to be to make *common people* suppose that "influential men" think enough of the book to buy and pay for it—whether they do or not. Does not this virtually contemplate a conspiracy between publishers, canvassers, and these important "influential men" to obtain money under false pretences from the general public? It looks very much like that to a Country Minister.

April 22, 1875.

# Notes.

PORTER & COATES, Philadelphia, have in press 'Storms: their Nature, Classification, and Laws, with the Means of predicting Them'; a reprint of J. Hain Friswell's essays entitled 'The Better Self'; the first volume of an American translation of the Comte de Paris's 'History of the Civil War'; and 'The American Centenary'—a review of the national progress—by Benson J. Lossing.——In the new edition of Prescott's complete works (Lippincott) we have remarked that the introduction to 'Charles V.,' so admirable for the time when it was written, is left untouched by the editor, not even the notes giving any intimation of the great progress made in the knowledge of the Middle Ages within the last hundred years. The editor may have chosen to regard the work as a literary monument to be preserved as it stands, and certainly it would require very extensive if not entire recasting.——Dr. Joseph P. Thompson, in continuance of his laudable efforts to enlighten the Germans with regard to his native country, purposes delivering next winter in Berlin a course of lectures for the Centennial. They will be given in English but reported and published in German, and will embrace the following topics: Grounds and Motives of the Revolution; Doctrines of the Declaration; Adoption of the Constitution; Washington as General and President; Vicissitudes of the Government; Territorial Expansion; Slavery and the Civil War; Inventions and Discoveries; Education and Religion; Service of the United States to Mankind; Criticisms and Prophecies.——On the 1st of April the London *Times* began the daily publication of a small chart of the weather. Doubtless the same thing would be practicable here, but it may seem unnecessary in view of the wide distribution, in public places, of our signal-service charts. ——Schoenhof & Moeller send us the first number (for February) of a new Italian periodical called the *Giornale Napoletano di filosofia e lettere, scienze morali e politiche.* It is to be issued bi-monthly under the direction of Prof. Francesco Fiorentino, with the aid of a number of his colleagues in the University of Naples and in Parliament. The opening article is an anti-Darwinian dialogue on the origin of things; the others are on the neglect into which the Neapolitan dialect has fallen ('Il Gran Basile,' by Professor V. Imbriani); on Campanella's views of religious reform (by the editor); on Savîtrî and Alcestis, a study in comparative mythology; a wholesome criticism on Dumas's preface to the new edition of 'Manon Lescaut,' etc., etc. There are numerous book reviews, and notes on a variety of topics of public and literary interest. The *Giornale* seems to offer a full return to its subscribers.——F. W. Christern has received a few copies of a pamphlet on the 'Famine in Asia Minor,' consisting mainly of articles on the subject from the *Levant Herald* (March—November, 1874). The reading of this history will both stimulate and discourage the benevolent. The famine is not yet a thing of the past, and the late winter will probably have renewed the ravages caused by that of 1873–4. Moreover, the Turkish misrule by reason of which "the vitality of the country burned so miserably low in the socket that the first puff of adversity extinguished it," remains, and must continue as long as Turkish finances are what they are. Here are a few figures: Population of the 160–170 agricultural villages belonging to the Caza of Keskin: 52,000 (1873), 25,000 (1875); the dead being estimated at 20,000. Pairs of oxen, 2,206 (1873), 427 (1875).

—Two annuals are before us whose character is so well established that they call for little comment from year to year. One is the 'Annual Record of Science and Industry,' edited by Prof. Spencer F. Baird (New York: Harper & Bros.) This most useful work, which seemed all-embracing before, now takes on a department of bibliography—in the present edition, a mere catalogue of titles; hereafter, to be accompanied by a critical discrimination. The editor also calls attention to the increased space allotted to the "General Summary of Progress," which precedes the detailed mention of the facts. The index which harmonizes the rather unsystematic arrangement, maintains its excellence. The meritorious 'Annual Register of Public Events at Home and Abroad' (London: Rivingtons) shows no change of scope or arrangement. We have commonly chosen to confine our criticism of it to the chapter or section devoted to the United States. This year the country is honored with ten pages instead of eight, and the perspective of events here is more satisfactory than formerly. The struggle with the inflationists, the disorders in the Southern States—particularly in Arkansas, Mississippi, and Louisiana—and the fall elections, certainly determine the physiognomy, so to speak, of the past year. They are all noticed in the 'Register,' and so is the death of Mr. Sumner; but, in accounting for the Democratic successes, it would have been in order to allude to Sanborn and Simmons; and the Potter Law might have been used to cast a side-light on inflation and repudiation tendencies. Perhaps we ought to feel obliged to the editor for overlooking all these disgraces. We would nevertheless suggest to him, as we did once before, that the United States would be more intelligently treated by some one who paid special attention to its politics, and was not obliged to substitute extracts from the London *Times* for his own knowledge and judgment of affairs on this side the water. Such an observer would probably have recorded the Beecher-Tilton scandal, and it will be strange if the present suit does not figure next year among the "Remarkable Trials" of the 'Register.' The public documents and state-papers collected in the appendix relate to the Ashantee war, the Bengal famine, the International Postal Convention, the Brussels Conference, the purchase system, the imperial census of 1871, British patents, judicial and police statistics, etc., etc.

—Messrs. Diossy & Co. of New York, and Messrs. Callaghan & Co. of Chicago, publish a digest of railway cases by John F. Lacey, of the Iowa bar, which will be found a useful book for lawyers. The title "Railways" has in modern times become so well accepted in the profession that not even the most puritanical theorist can object to it. Undoubtedly, the multiplicity of titles of a purely practical as distinguished from a purely legal character, is an indication in a small way of the chaotic condition of the law; and the scientific modern student, educated in a proper scorn for the unphilosophical Blackstone, may tremble when he hears from time to time of ever new and more voluminous divisions and subdivisions of the law, threatening to make the titles of jurisprudence conterminous with those of the dictionary. Objections of this sort, however, do not apply to railroads, and there can be no doubt either that, as all law has a practical basis, the practical divisions of it, determined by changes of circumstances, are necessary, unavoidable, and useful. Railroads are corporations, as they are also common carriers; but they are a sufficiently peculiar kind of corporation and common carrier to have developed a body of law peculiar to themselves, and for this reason a digest of this law has long been much desired. Mr. Lacey's digest includes "all reported American cases in which a railway company is a party, and all other cases in which railway law is determined."

—A correspondent writes us as follows: "As your readers are aware, there has been publishing for some months in England a series of manuals called 'Epochs of History,' which Scribner, Armstrong & Co. are reprinting here. In the original programme of the series, along with such names as W. Stubbs, James Gairdner, and G. W. Cox, appears that of William O'Connor Morris, who, if equally deserving, certainly does not enjoy the same reputation as the others for careful and tested scholarship. Now, it seems that when Mr. Morris got his book ready (his subject was the French Revolution) it was rejected by the editor of the series, Mr. E. E. Morris. Thereupon the former gentleman issued his book as an entirely independent publication, and with entirely different mechanical get-up, stating in the beginning of his preface that the work had been rejected as one of the 'Epochs,' and giving as the reason that in the opinion of the editor it was too mature for the students for whom the series was designed. The American publishers immediately reprinted it as one of the 'Epochs,' suppressing the part of the preface from which I have quoted, and thus give it whatever advantage may be derived from association with the other authors and the responsibility of the editor. The too great maturity of the work certainly appears in a curious shape. No mention whatever is made of the meeting of the Notables; it is stated (p. 20) that 'the Court *had consented* that the number of the representatives of the people should be double what it had been formerly'—the truth being that the Court, of its own will, had overruled the decision of the Notables against this. These are specimens of the graver errors; there are hosts of slighter ones, due to the author's fondness for sound. Thus he speaks of 'the Estate composed of more than 1,200 deputies.' The number was 1,145. The author also adopts the old *serf* mistake, telling the story (p. 32) in a way that would do credit to Wendell Phillips himself. In his version it is the peasant's blood, instead of his entrails, in which the lord warms his feet. On the whole, I am inclined to think the editor may have had other reasons than the one given for rejecting Mr. Morris's work."

—A large collection of intaglii and cameos is on exhibition in Philadelphia, for the benefit of the Women's Centennial Committee. The gems are selected from the cabinet of Mr. Maxwell Sommerville, and number more than nine hundred. Among them are portraits of every Roman emperor, from Augustus to Posthumus, except the son of Philip the Arabian, and Posthumus (replaced by a coin). A head of Ajax—agate-onyx (389), very fine in colors and workmanship—a modern turquoise with the Death of Cleopatra (776), a

rare jacinth with one of the Ptolemies (760), a vintage incident in amber (475), a curious Persian portrait with tiara in reverse (372), a ruby with child's head (511), and an emerald showing Maximinus Pius in relief on obverse and Victory in intaglio on the reverse (495), are among the curiosities of the collection, which includes many other rarities in antique and cinque-cento glyptic art. A number of family portraits have been lent for the same exhibition, interesting for their subjects as well as the names they bear, among which are those of Kneller, Stuart, and West.

—The geographical publications of the year, November, 1873–74, are as usual very fully recorded, with the proper classification, by Dr. W. Koner, in the *Journal* of the Berlin Geographical Society (No. 54). The number is also made valuable for reference by Henry Greffrath's statistical article on the progress of the South Australian colonies. Among other items, the cost of the overland telegraph, 1,785 miles long, is set down at $1,860,000, or, nearly enough, $1,000 a mile. For a stretch of six hundred miles it was necessary to use iron posts, in order to avoid the destructiveness of the white ants, and this alone involved an outlay of $250,000. A communication on some recent measurements of altitudes in South America, by Drs. W. Reiss and A. Stübel, gives 6,310 metres (20,702 feet) for Chimborazo, and 5,943 metres (19,498 feet) for Cotopaxi. The same heights are given by Mr. Henry Gannett, in his recent 'Lists of Elevations,' as 21,440 and 18,875 feet respectively. The chief feature of Petermann's *Mittheilungen* for March 2 is the beginning of a condensed itinerary of Livingstone derived from his 'Last Journals,' and illustrated by a remarkable map, which represents the latest stage of our knowledge concerning the country in which he laid down his life. Asia and Oceanica are mostly regarded in the *Geographical Magazine* for April, the leading article being by Col. Henry Yule, on "Trade Routes to Western China." The accompanying map is of Farther India and Southwestern China, and indicates the route of the recent unfortunate expedition up the Irawadi to Tali-fu. Col. Yule is not sanguine as to the chances of this line competing with the Yang-tse as a channel of commerce.

—Collectors of choice photographs should have an eye to the fifty taken by Herr Remelé on Gerard Rohlfs's late expedition to the Libyan Desert. Unfortunately, the Khedive, at whose charge the album has been got up, with the luxuriousness habitual to that monarch, allowed but a hundred sets to be made, and none of these are for sale. They are of course unique, as no photographer had ever penetrated into this wilderness. The desert landscapes are said to be singularly effective ; the vegetation of the oases is also very picturesquely rendered. Five plates are devoted to the temple at Dachel, uncovered by Herr Remelé himself, and there are several other architectural subjects, besides a few views from Siut and Homra on the Nile. To any one aware of the difficulties of photographing in a hot climate, the high artistic excellence of this album will seem above praise. Some account, by the way, of the geographical results of the Rohlfs expedition is given by one of its members, Professor W. Jordan, in an address which has been printed in the Virchow and Holtzendorff collection of popular scientific essays (No. 218 ; Berlin : Carl Habel). Incidentally, Dr. Jordan discusses the feasibility of converting part of the Libyan Desert into an inland sea. It was discovered that the oasis of Siwa lies in a basin from 75 to 100 feet below the sea-level, and from one to two days' journey in width. This could undoubtedly be flooded from the Mediterranean by leading a canal from the Syrtis Major, but the channel would have to be of enormous dimensions to overcome the evaporation of the Sahara, and, after all, the saline products would render the lake valueless, and the region for ever uninhabitable. Dr. Jordan anticipates a similar fate for the experiment which the French seem bent on trying in the salt-marshes lying to the south of the Atlas of Constantine, with a view to modifying the climate of Algeria. He doubts if it is possible to establish in a canal leading from the Gulf of Gabes such an inward and outward flowing current, of salt and fresh water, as exists in the Straits of Bab-el-Mandeb ; and the inward-flowing stream, he calculates, would have to deliver at least five times as much water as the Rhine. Were the proposed lake created, even of the size of the Grand-Duchy of Baden, it would not exercise (as has been feared) any appreciable influence on the climate of Europe. In the Libyan Desert the depressed basin is too limited to excite apprehension from changes in the land and water in that quarter. On the other hand, in Algeria, the moisture would probably kill the date-palm, the most useful product of the soil, while it could hardly have more effect in reclaiming the surrounding country than the Red Sea and Mediterranean have had on the Sahara which touches their shores. Some enthusiasts have discovered on the west coast a sahara basin 250 feet below the sea-level, and lying between the Atlantic and Timbuctoo. They propose to make a canal of the river Belta, whose embouchure is near Cape Bajador, cut a short canal of five miles to connect with the basin, and so produce an inland lake which will carry the trader to the Niger at Timbuctoo, and open up the interior of Africa to gain, Christianity, civilization, etc., etc. This enterprise might be recommended to capitalists who have lost faith in railroad speculations.

—One of the most productive and profound students of the philology and literature of the Romance languages is Adolph Mussafia, Professor in the University of Vienna, and amanuensis at the Imperial Library. He has especially distinguished himself by his researches in the dialects of Northern Italy, which he has illustrated by a number of texts and philological studies. One of the most important of the latter is entitled 'Beitrag zur Kunde der Norditalienischen Mundarten im XV. Jahrhunderte' (Vienna, 1873). The author has presented a picture of the North Italian dialects in the fifteenth century, drawn from a number of MSS. and printed Italian-German glossaries of the same date. One of these appears to be the work of a German teacher living in Venice by the name of George of Nürnberg, whose address is given, and who is praised for having "*ein clugen sin ze leren an alz verdriessen.*" Mussafia has arranged his materials in the shape of a glossary, richly illustrated by references to the other Italian dialects. The volume will prove a welcome addition to Italian glottology as well as to general Romance etymology.

—Two more recent contributions by the same author to old Italian literature are : 'Zur Katharinenlegende' (Vienna, 1874), and 'Cinque Sonetti antichi tratti da un Codice della Palatina di Vienna' (Vienna, 1874). The first-named work contains the text (with philological remarks) of an Italian version in the Veronese dialect of the legend of St. Catherine, found in a MS. of the fourteenth century, in the library of St. Mark in Venice. This version, curiously enough, is closely related to an old French poem on the same subject, preserved in a MS. of the library of the Arsenal at Paris, written at Verona in the thirteenth century. The editor proposes in a future work to examine the poem in its literary relations to the other versions of this favorite mediæval legend. The five old Italian sonnets in the second-named work were found by the editor on the parchment lining of a cover of a MS. of the fourteenth century. These sonnets are in the handwriting of this period, but from internal evidence would seem to be much older, probably of the previous century, although Mussafia hesitates to pronounce on this point with certainty. They are interesting philologically and from a literary point of view, not being found in any Italian collection so far known. The last four of the sonnets form a continuous narrative very characteristic of the age. The first of the five is noteworthy from the fact that it contains the *rimalmezzo,* or inner rhyme, besides the usual end rhyme.

—Of interest to students of Provençal literature is another late work by the same author : 'Ueber die Provenzalischen Lieder-Handschriften des Giovanni Maria Barbieri' (Vienna, 1874). Barbieri was, as is well known, the author of a valuable work entitled 'Dell' Origine della Poesia rimata,' in which considerable attention is paid to Provençal lyrical poetry, and several MS. collections are cited. Mussafia endeavors to reconstruct these authorities, and discover whether they are identical with any of the well-known Provençal MSS. of Italy or Paris.

## MEMOIRS OF JOHN QUINCY ADAMS.*

WE have already called the attention of our readers to the first two volumes of this important publication. Three more have since been added to it, covering the whole ground from the author's first entrance into public life to his second term as Secretary of State, in May, 1822. The third volume is devoted to the Negotiation for Peace, The Hundred Days, and the Mission to England. The negotiations for peace brought Mr. Adams into intimate relations with Henry Clay, and the collision of these two fiery and imperious natures is worth a careful study. In natural, spontaneous eloquence Mr. Clay was the superior ; but in broad culture and in accurate method and untiring industry, Mr. Adams holds the first place in our civil history. Both were subject to sudden bursts of passion, which deprived them for the moment of all self-control. Mr. Adams confesses his weakness with a frankness which commands respect. If Mr. Clay had kept a journal he might, perhaps, have made a similar avowal. "In discussing with them (Gallatin and Bayard)," writes Mr. Adams, "I cannot always restrain the irritability of my temper." On one occasion he used the word "trick" in a manner at which all his colleagues took umbrage. "The use of the word 'trick,'" he confesses, "was harsh and unnecessary. The cor-

* 'Memoirs of John Quincy Adams. Edited by Charles Francis Adams.' Vols. III., IV., V. Philadelphia : J. B. Lippincott & Co.

rect principle in this case is to do nothing that may not be boldly avowed. I should have said this, and no more."

The preparation of notes is a severe trial to his patience :

"We had a short meeting of the mission in the morning to consider the new draft of the answer to the British note ; but Mr. Bayard was not present, and Mr. Russell wished to make a revision of the paper before it was finally discussed. The meeting therefore was adjourned until immediately after dinner, and we then sat until eleven at night, sifting, erasing, patching, and amending, until we were all wearied, though none of us was yet satisfied with amendment. On the part of my own draft, which had been left for consideration, two-thirds were now struck out. The remnant left of mine certainly does not form a fifth part of the paper as finally settled, and it is patched with scraps from Mr. Gallatin, and scraps from Mr. Bayard, and scraps from Mr. Clay, all of whom are dissatisfied with the paper as finally constructed. Each of us takes a separate and distinct view of the subject-matter, and each naturally thinks his own view of it the most important."

The close of the negotiation was marked by a bitter discussion, in which Mr. Clay took the lead. What was to be done with the papers of the commission, which contained the record of the negotiation ? Mr. Clay started the discussion by claiming them for himself. Mr. Adams thought that if they went to any one they should go to him as first commissioner. The other members took part in the discussion, and much unbecoming warmth was displayed. "Mr. Clay," writes Mr. Adams, "now lost all the remnant of his temper, and broke out with 'You *dare* not, you *cannot*, you *shall* not say that there has been a cabal of three members against you ; no person shall impute anything of the kind to me with impunity.' . . . I replied, 'What I *dare* say, I have dared to say in writing. Gentlemen may draw from it what inferences they please. I am not answerable for them.'" Mr. Adams had felt early in the discussion that he was not a favorite with his colleagues. In September he had written :

"In this debate I had continued evidence of two things. One, that if any one member objects to anything I have written, all the rest support him in it, and I never can get it through. . . . This is a severity with which I alone am treated in our discussions by all my colleagues. Almost everything written by any of the rest is rejected or agreed to with very little criticism either verbal or substantial. But every line that I write passes a gauntlet of objections by every one of my colleagues, which finally issues for the most part in the rejection of it all. I write and propose a great deal more than all the rest together, Mr. Gallatin excepted. I have in the end, I believe, not more than my fifth part in the papers as we dispatch them."

"This," he adds, with a frankness which almost amounts to naïveté, "must be in a great measure the fault of my composition, and I ought to endeavor to correct the general fault from which it proceeds." Every note renews the painful experience :

"In repelling an insolent charge of the British Plenipotentiaries, against the Government of the United States, of a system of perpetual encroachment upon the Indians under the pretence of purchases, I had taken the ground of the moral and religious duty of a nation to settle, cultivate, and improve their territory, a principle perfectly recognized by the laws of nations, and in my own opinion the only solid and unanswerable defence against the charge in the British note. Gallatin saw and admitted the weight of the argument, but was afraid of ridicule. Bayard, too, since he has been reading Vattel, agreed in the argument, and was willing to say it was a duty. But the terms God and Providence and Heaven Mr. Clay thought were canting, and Russell laughed at them. I was obliged to give them up, and with them what I thought the best argument we had."

Another point upon which Mr. Adams differed from his colleagues was the tone of their correspondence with the British commissioners. "The tone of the British notes," he writes in October, "is arrogant, overbearing, and offensive. The tone of ours is neither so bold nor so spirited as I think it should be. It is too much on the defensive, and too excessive in the caution to say nothing offensive. I have seldom been able to prevail upon my colleagues to insert anything in the style of retort upon the harsh and reproachful matter which we receive." On another occasion, he writes on receiving the British note : "We received this day the fifth note from the British Plenipotentiaries. It has the same dilatory and insidious character as their preceding notes, but is shorter."

At last the negotiations are completed, the treaty is signed, and Mr. Adams bids adieu for ever to Ghent, January 26, 1815, and, pushing straight on to Paris, reaches the city in time to be an eye-witness of the Hundred Days. He is presented to Louis XVIII., but not to Napoleon. Louis asked him if he was "in any way related to the celebrated Mr. Adams." This was a distinction ; for "the King, Prince, and Princess seldom speak to any one presented to them" But far more interesting are the friends, old and new, whom he meets in the circle which his diplomatic rank opens to him. First among them is Lafayette, unconscious of the part he is yet to play in that memorable year. There was De Tracy, George Lafayette's father-in-law, whom Lady Morgan called the Locke of France. There was Marbois, French Consul in the United States during the war, and who, in his history of Arnold's conspiracy, imitated St.-Réal. He calls on Madame de Staël, who is not yet up, but sends him, through her son, an invitation to dinner, which he accepts. Among the guests is Benjamin Constant, of whom he draws an unflattering portrait :

"The conversation was not very interesting—some conversation between the lady and M. Constant, who seemed to consider it as a principle to contradict her. At one time there were symptoms of a conversation arising upon a subject of political economy, upon which she said : 'J'interdis tout discours sur l'économie politique. Ah ! je crains l'économie politique comme le feu.' Immediately after dinner she left us, saying, 'Je vous laisse mon fils, qui est très-aimable,' and went to the Théâtre Français, to see the tragedy of 'Esther.' She invited me to come and see her again, and said she was at home almost every evening. She also apologized for being obliged to leave her company soon 'pour aller au spectacle.'"

Mr. Adams visits the halls of ancient sculpture, and feels that "the Apollo, the Venus, and the Laocoön absorb the consideration of everything else ; the eye of the enquirer begins and ends with them." Of modern sculpture as compared with the ancient, he modestly observes : "I am still not prepared for committing to paper my remarks." If he had always been of this mood, we should not have seen Persico's very bad statues disfigure our National Capitol. He attended the sessions of the courts with a professional interest, particularly in the trials by jury, to which the French mind was not yet accustomed. His days were passed in sight-seeing, his evenings were given up to society, and above all to the theatre. This, indeed, was his favorite recreation, which his early familiarity with French manners and the French language enabled him to enjoy as few foreigners can. Suddenly, it is known that Napoleon is in France. The morning *Moniteur* declares him "a rebel and a traitor," and soon the newsboys raise the cry, "Ordonnance du Roi concernant Napoléon Bonaparte." The news seems to have fallen lightly at first on Parisian ears, for at the opera to which he goes in the evening, the audience call for "Henri Quatre" before the play begins, and, when the Duc de Berri enters, shout "Vive le Roi." Two days pass, and the cry of "Vive le Roi" is still heard at the theatre and "Henri Quatre" is still called for. But Mr. Adams notes as an inauspicious circumstance that his next-door neighbor at the hotel, "the Count de St. Antonio, whose wife is an Englishwoman, left the city this day, having intended to remain here two months longer." At three he goes to the bookseller's to complete his copy of the Bibliothèque des Théâtres and notes on his way a "great number of post-horses, apparently going to take travellers leaving Paris." In the afternoon come the tidings that the British had been totally defeated before New Orleans.

The restlessness invades the theatres, though cries for "Henri Quatre" and "Vive le Roi" are still heard :

"In the box next to me," he writes, "there was a man, his wife, and their son, a boy of nine or ten years of age. The man was in great agitation and anxiety ; he left the box at the end of the second play, and returned after the first act of the third was over. His anxiety was then much increased, and during the rest of the performance he was telling his wife, in short, interrupted sentences, what he had heard. He spoke in a low voice, and I heard only fragments of what he said. He had been to see some friends whom he had found 'très-abattus.' 'It was said that —— [I could not hear the name] was killed.' Then some other names. 'Ils croyent aller à la fortune.' Then, the 'Duc de Berri a dit qu'il resterait à Paris avec le Roi.' Then, 'on dit que Cambacérès est parti.' Then, 'on attend avec inquiétude les nouvelles de demain.'"

He passes the next evening also at the theatre, where Bourbon songs are still called for. On his way home he meets "numerous patrols of soldiers, national guards, and sentinels at the corners of the streets ; news placarded on the pillars, and clusters of people collecting and attempting to read them by the light of the lamps. I stopped a moment at one of these clusters, when a patrol came up, and the patrol at their head said, in a low voice, 'Dispersez-vous, messieurs, dispersez-vous.' Another patrol, meeting two soldiers in a red uniform, made them stop and all cried 'Vive le Roi.' . . . A handbill of news—'très-satisfaisante'—from Monsieur was circulating, promising the speedy deliverance of Lyons. The agitation in the city has much increased within these two days." The next day he sees Gallatin, and while he was with him General Lafayette came in. "It is ascertained that Napoleon was at Lyons on Friday last, the tenth. The Duke of Orleans, Monsieur, and Marshal Macdonald have returned to Paris. Napoleon had only twelve or thirteen thousand men at Lyons." Mr. Adams still goes to the theatre, the best school for the study of Frenchmen—"the house very thin." "'Henri Quatre' was once played without being called for. The pillars of the Palais Royal are plastered with appeals to arms against Bonaparte." On the 14th he writes, "Met the Baron Bielefeld, who concurred in the opinion prevailing that the Government will be maintained." "A strong spirit has yesterday and this day appeared. The moment of

consternation has passed away, and that of confidence and energy has succeeded. The number of volunteers who have offered themselves at Paris to march against Bonaparte is greater than the Government could accept. A corps of five hundred men has been formed of the students of law, who offered themselves in a body." He sits next to one of them at the opera.

"He appeared to be in great anxiety. He said that he was enrolled in this corps of students at law; that they had been inspected this day, and were to be reviewed to-morrow. They were ordered to appear in uniform, but it was impossible to get a uniform in one day, and he did not think they ought to be required to clothe themselves at their own expense. He did not know what was to happen; he had just finished his studies at the law, and was to have maintained his thesis next week for admission to the bar. Now, God knew what would become of him. He had come to the opera 'pour s'étourdir'; that the disposition of the nation was very good; an immense number of volunteers had offered their services, but 'il n'y a que les militaires.' 'And not all of them,' said the neighbor. 'Several officers dined with me on Sunday. They said they had faithfully served Bonaparte when he was emperor, and would faithfully serve the king now. Many others have the same sentiments, and you may be assured you will have very little to do. It will be all over in a very few days.' This same person speaking to me said, before the play began, 'Perhaps they will announce to us some news from the theatre this evening.'"

"The house was very thin." "'Henri Quatre' was called for and played with the usual applause." Mr. Adams is struck by the contrast between the crowded benches of his first coming and the empty benches of the present. Others observe it also, and a discussion goes on near him whether it was owing to the state of public affairs or not.

"The public spirit of Paris now is confident and sanguine. It does not appear that Napoleon has advanced from Lyons. He is undoubtedly then very weak, and formidable forces are marching from all quarters. It is ascertained that a part of the troops as well as of the highest officers are faithful to the king, and Napoleon's soldiers will probably desert him in the end. There is but one sentiment to be heard in Paris."

The theatre is again rapturous over Bourbon songs. Three days later he finds himself in company with Mr. Gallatin and General Turreau. Mr. Gallatin had "heard that Bonaparte would be last night at Auxerres, and he supposed there would be a battle to-morrow. Turreau smiled, shrugged his shoulders, and said: "Une bataille—allons donc!" Next day came tidings that Ney with all his troops had gone over to Napoleon, who will be here to-morrow. There is a great crowd pushing on towards the Carrousel, where the king is to review "the troops who are to march to-morrow morning to meet Napoleon." No appearance of anything like defection to the royal cause was discernible; but the countenances of the attendants at the Tuileries marked dejection. Mr. Adams is told that when "the officers of the garrison of Paris attempted to prevail upon the troops to cry 'Vive le Roi,' the soldiers would say, 'Oh, yes! vive le Roi!' and laugh. They had not a hope that the soldiers would fight for the king." One more night and the doubt passes away. "Mr. Beale came in and told me that the king and royal family were gone. They left the palace of the Tuileries at one o'clock this morning, and took the road to Beauvais. It was but last Thursday that the king at the séance royale talked, before the two legislative chambers, of dying in defence of the country. . . . The crowd on the boulevards cry 'Vive l'Empereur!'"

## EARL RUSSELL'S RECOLLECTIONS AND SUGGESTIONS.*

"LASTLY, to speak of my own work, I can only rejoice that I have been allowed to have my share in the task accomplished in the half-century which has elapsed from 1819 to 1869. My capacity, I always felt, was very inferior to that of the men who have attained in past times the foremost place in our Parliament, and in the councils of our sovereign. I have committed many errors, some of them very gross blunders. But the generous people of England are always forbearing and forgiving to those statesmen who have the good of their country at heart; like my betters, I have been misrepresented and slandered by those who know nothing of me; but I have been more than compensated by the confidence and the friendship of the best men of my own political connection, and by the regard and favorable interpretation of my motives which I have heard expressed by my generous opponents, from the days of Lord Castlereagh to these of Mr. Disraeli."

In these words the English statesman gives his own estimate of his own career. They might serve for his best epitaph, for they present a truthful account both of his defects and of his merits. It is undoubtedly true that Lord Russell has played a great part in the politics of half a century marked by great political changes. It is undoubtedly true that he has throughout his career had the good of his country at heart; and it is equally true that he has commanded the confidence and esteem of the best men of his "connection." This, and more than this, may be said in his praise, but his character and career have, as he himself points out with dignified candor, their weak as well as their strong side. In point of capacity he will never take rank with statesmen of the first class. He never possessed the impressive, marked individuality of Brougham; he could not pretend to rival the administrative talent of Peel. In later life he was found wanting in the versatile flexibility of Palmerston, and during his last ministry was completely outshone by the brilliancy of Mr. Gladstone's powers. It is, again, an undoubted fact that Lord Russell has committed "gross blunders." He blundered in not committing himself to the principle of free-trade; he blundered (though he does not yet see the blunder) when he wrote the Durham letter about the titles of the Catholic bishops; he blundered, as he frankly admits, in his dealings with Lord Palmerston in 1852. His whole connection with the Aberdeen Ministry was, as he himself avows, a mistake. He showed little sagacity when, on the eve of great changes, he recommended the public to "rest and be thankful"; and the greatest of his blunders—the failure to seize the *Alabama*—cost his countrymen some millions of money and no small amount of diplomatic trouble. Add to all this, that Lord Russell has from his youth upwards labored in the service of the people, yet has never been popular. His reward has been, as he himself feels, the esteem of the best men of his "connection"; but though he has gained the respect he has never gained the affection of the nation. How comes it, then, that a man not of first-rate talents, not a great administrator, not a very sagacious politician, not one endowed with the gifts which captivate popular favor, has nevertheless played a leading part for half a century in English public life? The question is a curious one, and the answer to it throws some light on the character both of English politics and of Lord Russell.

The most obvious cause of Lord Russell's success has been the strength of his "connection." Even now, at a time of what is called "democratic progress," the Liberal party choose as their leader a man who, as far as the public knows, has no one quality for leadership except that he is the representative of the Cavendishes. If this is the course adopted by a meeting presided over by John Bright, it is easy to estimate the importance of "connection" at a time when Birmingham had no members and no Quaker had ever sat in Parliament. In 1813, a Whig magnate who thought fit to take up popular principles was felt to perform an act of condescending patriotism, and this feeling was not unnatural at a period when to be a Whig was to sacrifice all chance of ever becoming a minister. This was the time when Lord Russell entered politics, and he was exactly the man for his day. From the very first he took up the attitude which he has occupied throughout his life. One of his earliest utterances was delivered at a dinner to commemorate the birthday of Mr. Fox. In reply to the toast, "The houses of Russell and Cavendish, and may they be ever united in the cause of freedom," "It is a satisfaction to me to reflect," he said, "that your favor is obtained not by the *accidental qualities of talents and power*, but by a steady adherence to those principles which animated Mr. Fox through life, and holding it on that tenure I trust it will never be forfeited." The words we have underlined are remarkable, especially in a young man of twenty-one. He bases his claim to favor not on talent, which he regards as an "accidental quality," but on strict adherence to the Whig tradition, which is, in his mind, the essential qualification for a statesman. Thus, at the opening of his public life, Lord Russell bound himself to his connection, and the party rewarded his devotion by their fidelity; what, however, must be remarked is that this policy was perfectly honest and natural on his part. He clung to the Whig party because he believed in Whig principles, and was by character, quite as much as by connection, a Whig to the core. Belief in Mr. Fox, belief in the Revolution of 1688, belief in civil and religious liberty, belief in Whig statesmen, and, above all, belief in himself, are so closely blended in Lord Russell's mind that, though they may be distinguished, they cannot be separated. Nor should it be imagined that this strict faith in a particular political creed (and we must add one of the best political creeds which the world has known) shows a want of intelligence or independence. Lord Russell has no doubt preserved tenaciously the sentiments of his youth; but the views which are now received by every sensible Englishman were, when he learnt them, startling paradoxes, rejected by almost every statesman of respectability and weight. Lord Russell was, moreover, prepared to think for himself; and at a time when most of his associates were opposed to the war with France, gave all his sympathies to the national struggle with Napoleon.

But neither the support of a powerful connection, nor even the capacity for seizing and adhering to a definite body of political principles, would of themselves account for Lord Russell's political success. He has always possessed two qualities which, if they do not constitute a great man, yet go far to raise a man of average talent above the level of his associates. These are boldness and honesty. Lord Russell has been assailed with as

* 'Recollections and Suggestions, 1813–1873. By John Earl Russell.' London: Longmans; Boston: Roberts Bros.

much abuse as most men, but no one ever ventured to question his courage. Sydney Smith's remark that his lordship would be prepared to take command of the Channel Fleet at a moment's notice, loses nothing of its point when it is discovered to have originated in a joke of Lord Russell's own; and though the *mot* may have been prompted by spleen, it has been remembered because all the world felt that it hit off the salient trait of Lord Russell's character. His natural intrepidity comes out oddly enough in his last work. He writes quite naturally with reference to the resignation of the Reform Ministry in 1832: "This was the only time during my whole political life in which I have felt uneasy as to the result." Let any one reflect for a moment on all that this sentence implies. Here is a man who has been at the head of affairs for years; who has conducted the English nation through more than one crisis; who, knowing himself to be liable to commit "gross blunders," has been compelled to make the most momentous decisions; yet, reflecting calmly on the events of his career, he can remember but one moment at which he felt uneasy, and that was a moment when England appeared on the verge of a revolution. The statesman who has never but once "felt uneasy" as to the result of his action certainly possesses one at least of the qualities which fit a man to be a leader of men. Nor is this fearlessness in any way affected. The writer who in his old age provokes Mr. Lowe to literary combat, and criticises the policy of Mr. Gladstone in a tone of severe censure which might certainly call forth a bitter rejoinder from a not very patient controversialist, cannot at any rate be called timid. This absence of fear is, moreover, closely allied with the honesty which after all constitutes the strength of Lord Russell's character. It costs little for an ex-minister to acknowledge that he has committed errors; but when Lord Russell says, in so many words, that he and he alone was responsible for the escape of the *Alabama*, and that he sees clearly his mistake in not having arrested the ship, even those who most regret his error cannot help feeling a respect for the manly honesty of his character.

In analyzing the causes which enabled Lord Russell to take a leading part in English politics, it is impossible not to separate his position and his character, but, in matter of fact, the two are hardly separable. There is much to be said against party connection and party tradition, but they have their good side. A minister who relies on the favor and friendship of the best men of his connection feels that he has firmer ground on which to rest for support than can be afforded by the uncertain and transitory good-will of the people. He may very likely be narrow, haughty, unsympathetic, but he is not likely to be wanting either in firmness or boldness. Dependence, again, upon the good-will of a connection is, if the connection be anything better than a gang of adventurers, certain to produce adherence to fixed principles or, at lowest, fixed prejudices. It is impossible to conciliate the respect of friends, and yet day by day change one's principles to suit the convenience of the moment. The influence of a party may to some characters be a source of vigor and an aid in adhering to fixed principles, and that the Whig connection has fostered all Lord Russell's virtues will, we think, become apparent to any one who reads with intelligence the wordy and diffuse but not uninteresting autobiography which he has placed before the world in the form of recollections and suggestions. No doubt the party bonds which, so to speak, sustained his character, have also been fetters by which its development may have been checked. His nature and connections have made him a most patriotic Whig, but he has never, like some few English statesmen, been able to convince the country that he could forget his party and think only of the nation. This defect has not arisen from any want of patriotism, but from the simple fact that, rightly or wrongly, Whig principles and patriotism have always seemed to Lord Russell to be one and the same thing. Nothing sets his character in a clearer light than a comparison of him with his great opponent. Peel, though educated a Tory, and the founder of the English Conservative party, was in character, as we pointed out the other day, a middle-class statesman imbued with the spirit of modern politics. His greatest act was to break with his party, and he thereby became the statesman of the nation. Lord Russell passed his youth fighting an up-hill fight in favor of popular principles, and owes his fame to having, at the age of forty, carried through what seemed at the time a measure of revolutionary reform. But Lord Russell, though he broke down by his measures a great system of aristocratic government, has remained to the end of his life an aristocratic statesman. In spirit and in tone of mind he belongs to the past generation. The reward of his patriotic services has been the friendship and esteem of the "best men" of his "connection." For this he looked and this he has obtained, but the very fact that he has never ceased to be the statesman of a party has prevented him from becoming a national minister. Yet even this want of widespread popularity need not be entirely the subject of regret either for him or for his admirers. He and his party have shared the same fate. They labored for the right of the people when to serve the people was to incur unpopularity. When the popular power had increased, they disdained to captivate popular applause, and in carrying such measures as the new Poor Law, conferred an immense benefit on the nation whilst incurring an amount of odium which few modern statesmen would have the courage to meet. Lord Russell and his associates have already gained their reward in the esteem of the wisest and best of their contemporaries, and rational and generous liberals on both sides the Atlantic will in the long run easily forgive the errors of statesmen who certainly have at heart the cause of human freedom as well as the good of their country.

## TAINE'S NOTES ON PARIS.*

THIS is a very clever work, but it is by no means one of the author's most successful. Indeed, though a brilliant failure, no one, we believe, has ever pretended that it was anything but a failure. The author has tried a *tour de force*, and missed his effect. He has attempted to force his talent, but his talent has resisted and proved fatally inflexible. He has wished to be light and graceful, but he has succeeded only in being most elaborately and magnificently grave. For M. Taine to attempt lightness was, it seems to us, a most ill-advised undertaking. It is true that he has been charged, as the historian of English literature, with a certain presumptuous levity of judgment; but in form, at least, he is always solid, weighty, and majestic. There are few writers whom, as simple writers, we prefer; his style is full of color and muscle and savor; but we never suppose ourselves, in reading it, to be dabbling in light literature, and we rarely take it but in moderate quantities at a sitting. If M. Taine treats a subject at all, he bears heavily; the touch-and-go manner is a closed book to him. Here he has tried the touch-and-go manner, and the effect is very much like hearing a man with a deep bass voice trying to sing an air written for a thin tenor. There is such a thing as being too serious to succeed in a *jeu d'esprit*, and this has been M. Taine's trouble. A writer of half the value would have done much better with the same material, and, indeed, we remember that at the same time that M. Taine's work appeared, eight years ago, and was voted by all good critics a rather melancholy mistake, M. Gustave Droz was making his literary fortune with 'Monsieur, Madame et Bébé,' being acknowledged to have hit the nail on the head with his little silver hammer far more justly than the historian of English literature with his formidable battering-ram. Yet one reads the book, as a failure if not as success, and, all abatements made, we feel ourselves to be dealing with a man of extraordinary talent. It is very possible that it may have even more readers in English than in French, and to the American public seem decidedly entertaining. We apparently are capable of consuming an inordinate quantity of information, veracious or the reverse, about Paris, and the present volume is sufficiently free-spoken as to those social mysteries which are deemed typically Parisian. Many readers will take much satisfaction in reading in English what could not possibly with decency have originally been written in English. M. Taine is not easy to translate; but, well translated, he need be but a trifle less effective than in his own tongue. He loses very much less in a foreign version than his great fellow-critic Sainte-Beuve; for his chief characteristics are not subtlety and fugitive, idiomatic grace, but vigor and amplitude and a certain imaginative splendor, such as the English language is peculiarly qualified to render. To translate Taine, indeed, is in a measure to make him restore what he has borrowed, for there is a large English element in his style. The present translation has been very cleverly done, and the right word often found where some taste was required to select it.

Exactly what M. Taine desired to do we hardly know; what he has done is to produce a singular compound of Stendhal and Théophile Gautier. Stendhal, as all readers of our author know, is the divinity of whom M. Taine is the prophet. Stendhal invented a method of observation which, in M. Taine's opinion, renewed the whole science of literary and social criticism. This method M. Taine has constantly applied—first to authors and books, then to works of art, and at last, in this case, to men and women, to a society. It was in this last fashion that Stendhal himself chiefly used his method; he was not a literary critic, he was a practical psychologist; he lived most of his life in Italy, and his work was the study and description of human nature in Milan, Florence, and Rome. He accumulated facts and anecdotes; he judged that there were none too trivial to serve as a stroke in the portrait; and he has left a storehouse of good, bad, and indifferent ones. M. Taine has proposed to do for Paris what Stendhal did for

* 'Notes on Paris. The Life and Opinions of M. Frederic-Thomas Graindorge, etc. By H. A. Taine. Translated by John Austin Stevens.' New York: Henry Holt & Co. 1875.

Milan; but he has come fifty years later, and he is consequently much more complex and needs a great deal more machinery. He is picturesque, for instance, both by necessity and by taste, which Stendhal was not at all, in intention; his book overflows with the description of material objects—of face and hair, shoulders and arms, jewels, dresses, and furniture—and it is evident in all this description that, although M. Taine is a man of too individual a temperament to be an imitator, he has read Théophile Gautier, the master in this line, with great relish and profit. He is shooting in Gautier's premises, and when he brings down a bird we cannot help regarding it as Gautier's property.

M. Taine has endeavored to imagine a perfect observer, and he has given this gentleman's personality as a setting to his own extremely characteristic lucubrations. His observer is M. Frederic-Thomas Graindorge, a Frenchman, a bachelor, a man of fifty, who has made a fortune by hog-packing in Cincinnati, and returns to Paris in the afternoon of his days to take his ease, see the polite world in epitome, and systematize a little his store of observations. He has gone through the mill and been ground very fine; he was at school at Eton, as a boy; he was afterwards at the University of Jena; he has passed twenty years in our own great West, where his adventures have been of the most remarkable description. In his local color, as to this phase of his hero's antecedents, M. Taine is very much at fault; and this is the greater pity, as he has never failed to profess that one should speak only of that which one directly and personally knows. He knows the manners and customs of our Western States in a very roundabout and theoretical fashion; he seems to be under the impression, for instance, that the picturesque art of hog-packing (up to the time of our late war) was carried on in Cincinnati by slave-labor. "I desire only to listen and to look," says M. Graindorge; "I listen and I look; no woman is displeased at being looked at; nor any man at being listened to. Sometimes, as I button up my overcoat, an idea comes to me: I write it down when I go home; hence my notes. You see that this is not a literary matter." It is much more literary than M. Graindorge admits; and his notes have been for M. Taine quite as much an exercise of style as an expression of opinion. He writes admirably; he writes too well; he is simply the very transparent mask of the real author. He is, therefore, as a person, a decidedly ineffective creation, and it was hardly worth while to be at so much labor to construct him. But the point was that M. Taine desired full license to be sceptical and cynical, to prove that he had no prejudices; that he judged things not sentimentally but rationally; that he saw the workings of the *machine humaine* completely *à nu*, and he could do all this under cover of a fictitious M. Graindorge more gracefully than in his own person. M Graindorge is the most brutal of materialists, and the more he watches the great Parisian spectacle, the greater folly it seems to him to be otherwise. He finds it all excessively ugly, except in so far as it is redeemed by a certain number of pretty women in beautiful dresses, cut very low. But though it is ugly, it is not depressing; exaltation and depression have nothing to do with it; the thing is to see—to see minutely, closely, with your own eyes, not to be a dupe, to find it very convenient that others are, to treat life and your fellow-mortals as a spectacle, to relish a good dinner, and keep yourself in as luxurious a physical good-humor as possible until the "machine" stops working. That of M. Graindorge ceases to operate in the course of the present volume, and the book closes with a statement of his "intimate" personal habits by his secretary, in lieu of a funeral oration.

*Mendelssohn: Letters and Recollections.* By Dr. Ferdinand Hiller. Translated with the consent and revision of the author. (New York: Macmillan & Co.)—These recollections can hardly be called more than agreeable and smooth reading. There is nothing in them that is exciting or very new. Mendelssohn's life was not full of incident, and his character was so simple, so natural, and so pure that it is impossible to imagine anything in the nature of revelations about him from any quarter. Not, indeed, that Dr. Hiller promises revelations; for he does nothing of the sort. But we have been surprised in looking over his book, and going again through the brief story of Mendelssohn's life, to reflect how little striking it was. He was born, he wrote beautiful music, he loved his family, his friends, his wife, he died, and was mourned by them and by all lovers of good music. There is hardly anything in Mendelssohn's life that to a person not musical would not be profoundly uninteresting; and we can easily imagine a person "without an ear" convincing himself by the perusal of Dr. Hiller's book that there was, after all, "nothing in it" beyond an organized conspiracy on the part of half the world to persuade the other half that, of the two, it had the higher and more delicate perceptions—for no other reason than that it could pretend to discover a beauty in what to the unmusical is merely a disorderly succession of sounds. But we would advise all lovers of music and of Mendelssohn to read Dr. Hiller's recollections, as they are those of an intimate friend, whose attachment and interest were founded no less on professional than on general sympathies, who understood Mendelssohn thoroughly, and is therefore well qualified to stand as intermediary between the memory of his friend and the public.

## *Taine's Notes on Paris.*

Notes on Paris. The Life and Opinions of M. Frederic Thomas Graindorge, Doctor of Philosophy at the University of Jena, special partner in the house of Graindorge & Co. (oils and salt pork), Cincinnati, Ohio. Collected and published by H. A. Taine, executor. Translated by John Austin Stevens. Large 12mo (uniform with the recent edition of Taine's 'Italy,' 'England,' etc.), $2 50.

"One of M. Taine's brightest works. . . . The suppositious observations of one M. Thomas Graindorge, . . . who, having amassed a fortune . . . in America, returns to his native France, and jots down with a free pen [and] delicious wit what he sees. This outside view of their city greatly amused the readers of *La Vie Parisienne*."—*N. Y. Tribune.*

"Some of the brightest and wittiest sketches of Paris life that have ever been written."—*Boston Globe.*

"There are books which invite and fascinate, just as nuts are said to be fascinating. It is hard to leave off eating walnuts, and having begun such a book as Taine's 'Notes on Paris,' it is difficult not to turn just one more page."—*N. Y. Evening Post.*

## *Walford's Mr. Smith.*

Mr. Smith: A part of his Life. A Novel. By L. B. Walford. 16mo, Leisure Hour Series, $1 25.

"The best novel of the spring."—*N. Y. Tribune.*

"'Mr. Smith' is by no means an ordinary production. . . . There are satisfactory, even delightful, bits—passages which one reads over and over again, sayings one would be glad to remember, traits of shrewdness and humor which strike one with a pleasant sense of their aptness."—*London Spectator.*

*SHEFFIELD SCIENTIFIC SCHOOL of Yale College.* Address PROF. G. J. BRUSH, New Haven, Conn.

*SCHOOL OF MINES, Columbia College.—Courses in* Mining and Civil Engineering, Geology, Mineralogy, Chemistry, Assaying, etc., etc. Send for catalogue. C. F. CHANDLER, Dean of Faculty, East Forty-ninth Street, New York.

*ST AGNES SCHOOL, Albany, N. Y., under direction* of Rt. Rev. W. C. Doane. Circulars sent on application.

*SWARTHMORE COLLEGE, for both Sexes, under* the care of Friends. For catalogue address the President, EDWARD H. MAGILL, Swarthmore, Penn.

*WESLEYAN UNIVERSITY, Middletown, Conn.* President, Joseph Cummings, D.D., LL.D. For catalogues, etc., address the PRESIDENT.

*WORCESTER FREE INST. of Industrial Science.* Address Prof. C. O. THOMPSON, Worcester, Mass.

*WILLIAMS COLLEGE, Berkshire County, Mass.*—Every facility for thorough College education. $6,000 given annually to aid indigent students. Next examination for entrance, July 5 and 6. For catalogues or additional information apply to the President, P. A. CHADBOURNE. Williamstown, Mass., March, 1875.

*WILLISTON SEMINARY, Easthampton, Mass.* Complete in its equipments for Classical and Scientific study. Apply to M. HENSHAW, Principal.

*YOUNG LADIES' INSTITUTE at Brussels. Tuition* in all branches of education, Modern Languages, and Music by Professors of the University and the Conservatoire. Large house and grounds in a healthy location. For further information apply to MISS E. VENT, 211 Avenue Cortenbergh, Brussels, or Mrs. E. NOEGGERATH, 42 West Thirty-fifth Street, New York.

*GEO. E. WARING, Jr., Consulting Engineer, for* Sanitary and Agricultural Works, Newport, R. I.

*J. WEIDENMANN, Landscape Gardener and Engi-* neer, 110 Broadway, New York.

*A VACATION HOME, Portsmouth, N. H.—Miss A.* C. MORGAN will remain at her Boarding School during the summer, and receive a few young ladies into her family. For full particulars, apply as above.

*A FAMILY OF ADULTS can find board, for the* summer or permanently, in a quiet household, pleasantly placed in a healthful part of Orange, three minutes' walk from a railway station, and conveniently near to many churches. References are to be exchanged. Address B., *Nation* Office.

*LAKE DUNMORE HOUSE, Salisbury, Vt. E. P.* Hitchcock, Proprietor, at No. 1 West Thirty-eighth Street, until May 1.

*THE CLIFF COTTAGES, Newport, R. I.—These* Cottages, eight in number, are located on the Cliffs near the famous beach. They have ample grounds in lawn and flowers, are fully furnished, and are supplied with meals and service from the hotel on the premises. Everything is strictly first-class. For particulars address L. D. DAVIS, Agent.

*TO RENT in Brooklyn—The Three-Story Brick House,* No. 362 Henry Street. All improvements, and in good order. A large house (4 stories in rear), convenient to ferries. Immediate possession and a low rental. Address J. CORNELL, corner Court and Joralemon Streets, Brooklyn.

*TO LET, Unfurnished, for two years, at a low rent,* to a good tenant, the house 10 West Forty-eighth Street, nearly opposite the Reformed Dutch Church. Full width, with dining-room extension; three stories and an attic; in perfect order. Apply to HOMER MORGAN, 2 Pine Street, or at the *Nation* office.

*FOR SALE, at Englewood Cliffs, Palisades-on-the* Hudson, a country residence, with about four acres of ground. This property extends to the bluffs, and includes the first prominent point above the Palisades Mountain House, and within five minutes' walk of it. This point commands one of the finest views on the Hudson River, modern well-built house, 32x46, high ceilings, pleasant rooms, carriage-house, garden, pasture grounds and lawn, with abundance of fine shade-trees. This high plateau of the Palisades has precipitous bluffs, a well-sunned southeastern exposure, and is washed at the base by the salt water without marshy foot-lands. It has for these reasons commenced to attract the attention of wealthy citizens who particularly desire a healthy situation near New York and within sound of her church bells. Its great elevation, overlooking the Sound and almost in view of the ocean, gives a fine combination of sea and mountain air. For maps of the property and further information, apply to LEWIS W. LEEDS, on the premises, or at 110 Broadway.

READY THIS DAY.

## *A Satchel Guide*

FOR THE

VACATION TOURIST IN EUROPE.

Revised to April, 1875. With Maps.

In one volume 16mo, roan, flexible, $2.

This invaluable guide-book, which was first issued in 1872, has quickly taken its place as the most accurate and comprehensive compact guide yet published for American use. It includes the British Isles, Belgium and Holland, Germany and the Rhine, Switzerland, France, Austria, and Italy. It gives the traveller the precise information he requires, and indulges in no waste of words. The maps are excellent.

"We know of no European guide-book which so admirably combines brevity, accuracy, completeness, convenience of shape, and tasteful mechanical execution."—*Independent.*

"It is pleasant to come across a book perfect of its kind."—*Washington Chronicle.*

*** For sale by all booksellers. Sent, post-paid, on receipt of price, by the publishers,

HURD & HOUGHTON, NEW YORK;
H. O. HOUGHTON & CO., BOSTON;
THE RIVERSIDE PRESS, CAMBRIDGE.

SECOND EDITION.

## *HELPS TO PRAYER.*

A manual designed to aid Christian Believers in acquiring the Gifts and in maintaining the Practice of Prayer in the Closet, the Family, the Social Gatherings, and the Public Congregations. By Rev. D. P. Kidder, D.D. 12mo, $1 75; Red-line edition, toned paper, gilt edges, bevelled boards, $3 50.

COMMENTS OF THE PRESS.

"We believe no earnest person can read this volume without gaining great benefit."—*Christian Union.*

"It has been prepared with intelligence, judgment, and care."—*Christian at Work.*

Have now ready:

## *The Religion of Humanity.*

BY O. B. FROTHINGHAM.

Third Revised Edition. Square 12mo, cloth extra, $1 50.

The 'Religion of Humanity' is a marked book, a cause of admiration and satisfaction to those who hold with the author, a target for the keenest shafts of those who differ from him. . . . It impresses the thoughtful reader as profoundly sincere, the work of one who has read largely, studied thoroughly, reflected practically. The book is a model of scholarly culture and of vigorous and finished style."—*Boston Globe.*

"Nobody can peruse Mr. Frothingham's book without respect for his learning, for his mental honesty, for his skill in stating his convictions, and for the essential integrity and philanthropic tendency of his spirit."—*Springfield Republican.*

## *Mr. Frothingham's Sermons.*

SECOND SERIES.

Published semi-monthly, price 5 cents each, or by mail, paid, 10 cents. Subscriptions received for the year at $2.

Complete lists of both series mailed on application.

JUST PUBLISHED.

## *A CHILD'S ILLUSTRATED FIRST BOOK IN FRENCH.*

BY PROF. JEAN GUSTAVE KEETELS,

Author of 'An Elementary French Grammar' and 'An Analytical and Practical French Grammar.'

The aim of this book is to make the study of the French language attractive and interesting to children who have no knowledge of the English grammar. The object-lesson plan has been adopted, the volume being fully and handsomely illustrated by engravings especially prepared for the book.

144 pages 12mo, handsomely bound in cloth. Price, $1.
A specimen copy sent to teachers for 50 cents.

PUBLISHED BY

CLARK & MAYNARD,
NEW YORK.

## *The Bible Educator*

Is now complete in 2 vols., clo., $10; in 4 vols., price $3 each.

The work needs no recommendation other than the mere mention of a few of the contributors: The Dean of Canterbury (Payne Smith); The Dean of Chester (Dr. Howson); Rev. F. W. Farrar, B.D. (Marlborough); Rev. Dr. Vaughan (Temple Church); Rev. H D. M. Spence, M.A.; Rev. W. Houghton, M.A., F.L.S. (Preston); Rev. Stanley Leathes, M.A., King's College; Rev. Geo. Rawlinson, M.A.; Major Wilson (Palestine Exploration); W. Caruthers (Botany Department British Museum); Jno. Stainor (Organist St. Paul's Cathedral). Edited by Rev. E. H. Plumptre, M.A.

*NEW YORK, THURSDAY, MAY 13, 1875.*

## The Week.

FROM the exposure of the whiskey frauds perpetrated in St. Louis and other Western cities, as given by the *Tribune*, it seems that for a number of years a Ring of distillers and rectifiers have, in collusion with an unascertained number of employees of the revenue, been defrauding the Government of about a million a year. There is nothing very surprising about there being plenty of people ready to engage in the illicit manufacture of whiskey, but some of the facts connected with the discovery of the frauds by Mr. Bristow, and his measures to put a stop to them, are indeed remarkable. The existence of the Ring was communicated to him in the first place, not by any member of the force employed by the Government for such purposes, but by a St. Louis editor, and the case in that city was "worked up" by an agent selected by the latter. In Washington, the great point on which everything hinged was that, whatever happened, the Commissioner of Internal Revenue should not suspect that a movement of any kind was on foot, not because he was dishonest, but because the Department was so honeycombed by the Ring that news of any hostile movement undertaken by it was sure to be communicated to the Ring. The arrangements for conveying intelligence were so complete that, even as it was, before the St. Louis agent had received his appointment a man had appeared in Washington and had interviews both with the Secretary and the Commissioner, for the purpose of finding out what was going on. The influence and political power possessed by the Ring were shown by the revocation of an order transferring all supervisors and special agents all over the country to new posts. This order was issued by direction of the President a good while ago, after consultation with the Commissioner and Secretary, they all being agreed that a screw was loose somewhere, and actually revoked by him subsequently—no doubt on representations as to the welfare of the party by "prominent men." All this shows the very complex nature of the obstacles thrown in the way of an honest Secretary of the Treasury, and the wonderful perfection to which the arts of corruption have been carried.

The most gratifying thing about the discovery of these frauds is that it is no mere exposure by unauthorized persons of half-real and half-imaginary facts, but consists in the most complete and overwhelming accumulation of evidence, with names, amounts, and dates. We may say also that it gives us a good deal of satisfaction to reflect that the agent appointed to carry out the work of detection, and who did it with great thoroughness and a skill which internal-revenue officers do not appear as a general thing to possess, was a member of that reckless and abandoned class, the journalists—he being no other than the financial editor of the St. Louis *Democrat;* and that the person who gave the information upon which the Secretary of the Treasury acted was his employer, the editor of that sheet. This can hardly be considered regular journalistic work, but Mr. Bristow was certainly fortunate in having it done. The press of this country has done a great work in the last ten years in arousing the public mind and conscience to a sense of the corruption of the times, and has received a great deal of abuse for doing so. It has pointed out particularly that the civil service was rotten; and so this case and a good many others have proved it to be. The newspapers, however, cannot be expected to undertake, as a regular thing, to collect the revenue for the Government. We shall watch with curiosity and interest to see who will be the next person to advise the President not to mind "what the newspapers say."

Mr. Wheeler, of the Louisiana Committee, who arranged the compromise which goes by his name, has satisfactorily settled all questions as to the good faith of the Conservatives by publishing a letter giving the facts. He says that there was no bad faith shown in unseating the four members after the adoption of the compromise; that the Democrats were right in doing it; and that he received notice from them long ago that it would be done. The facts as he gives them are these: After the expulsion of the Democrats by the troops in January, the Republicans unseated four Democratic members who had received certificates from the Returning Board, and as to whose election there was really no question, putting in four Republicans in their place. The case of these four members did not come within the scope of the Committee's enquiry, and the award did not touch them. Therefore, as soon as the compromise was accepted, these four men were reseated. Mr. Wheeler, whose letter is full of good sense, strongly deprecates the heated accusations brought against the Conservatives by Northern Republicans, and he points out that the great merit of the compromise is that under it, for the first time in years, the State has a government "admitted and recognized by the people." He says that the change for the better which has manifested itself in Louisiana affairs in the last few months is very marked, and that evidences of returning prosperity are to be seen on every side.

When Professor Marsh made his statement before the Board of Indian Commissioners, he must have known that he was disturbing a hornet's nest and might expect a good deal of angry buzzing as well as attempts to sting. He therefore was probably not surprised that even a Congressional delegate from one of the Territories should endeavor to break the force of his testimony by denying the veracity of Red Cloud. But if Professor Marsh was not surprised, it is quite likely that the delegate will be very much astonished when he reads the Professor's cool assertion, in a recently-published letter, that even if "Red Cloud occasionally draws a long bow," nevertheless, "in a question between Red Cloud and the Indian Ring, where both were interested, I should decidedly prefer the testimony of Red Cloud," supposing the testimony to agree with his own observations. The letter also contains additional evidence of the poor quality of the cattle furnished the Indians and of the insufficiency of their food and clothing; and the evidence is backed by the names of several army officers from whom information was received, one of the officers stating that "the poor wretches have been several times this winter on the verge of starvation through the rascality of the Indian Ring. They have been compelled to eat dogs, wolves, and ponies." The Professor attempts no answer to the statement that the agent at the Red Cloud Agency is very kind to the Indians, further than to say that the Indians certainly came near being killed by this kindness, and then adds: "What Indians need is not so much kindness as justice and firmness—qualities which are apparently wanting at the Red Cloud Agency."

The loss of the *Schiller*, last Friday, on the Scilly Islands will probably need a very close investigation before we can say exactly on whose shoulders the blame for so awful a calamity should rest. The captain has gone down with his ship, and is universally admitted to have behaved with all the bravery and coolness possible after the vessel struck; whether there was any negligence in not keeping a proper watch for the fog-bell, which, according to the telegrams, was "not heard," is another question, as is also how the vessel came, in bad weather and with the sea rising, to be close upon some of the worst and at the same time best-known reefs on the English coast. When we remember that an accident of exactly the same kind occurred on this side of the water not very long ago, and also that there is one line of steamers on which, for some reason

or other, no loss of life ever occurs, we are forced to the conclusion that there is a great deal of the grossest kind of negligence and incapacity in the management of a business which is by no means necessarily less safe than that of transporting passengers by land. The only valuable suggestion of a practical remedy has been made by the *Tribune*—we mean that of holding the steamship companies pecuniarily responsible for every passenger they lose or injure by negligence. The statutes which have been passed on this subject with regard to railroads have had a most beneficial effect, and we can see no reason why they should not have an equally good effect on ocean companies. Criminal statutes would be of very little use, because in any bad accident some of the most important witnesses are apt to be lost with the others, and, besides this, the punishment of the officers is not felt by the company. The pocket is the centre of the nervous system of a company, and if every one of these accidents entailed a heavy loss on the owners, we should hear of fewer cases.

---

For the press the week has been, on the whole, an unusually happy one. No editor has been subpœnaed to Washington that he might be tried there for libel, nor has any bench-warrant issued out of the Supreme Court; while the retirement of Mr. Williams from the Attorney-General's office and the appearance on the scene of Mr. Pierrepont make it pretty certain that less time will be devoted by the courts to the protection of the character of Mr. Shepherd in the future. Besides this, the verdict in the case of Phelps against Bowles will no doubt do a great deal to open the eyes of people—if there are any such left—who believe that all would be well if only the "floodgates of calumny," as Mr. Williams calls them, could be closed. The torrent of calumny kept flowing by Mr. Bowles, of the Springfield *Republican*, was turned by him some time since in the direction of Mr. Willis Phelps, a railroad contractor, active in Springfield politics. The *Republican* recklessly and injuriously declared that Mr. Phelps was corrupting the politics of the city, tampering with the purity of elections, carrying them indeed by aid of ballot-stuffers or repeaters; that he, being a rich man, was using his money to get money fraudulently out of the public; and that, in short, Mr. Phelps was the "Boss Tweed of Springfield." This was too much for human endurance, and so Mr. Phelps avowed his determination to put a stop to the thing at once, and brought an action against Mr. Bowles for $200,000. The case was not tried by a jury, but by a judge of the Supreme Court who has the reputation, we believe, of being extremely able. Before him Mr. Bowles went, refused to pay anything, and, to the amazement and chagrin of Mr. Phelps, substantially proved all the charges he had made. The court, considering that on one of the charges Mr. Phelps was entitled to a verdict, gave him a hundred dollars. The result of this suit ought to be an awful warning to all persons of shaky reputation who think of suing newspapers. If any one contemplates proceedings of this kind and is in doubt whether his reputation is or is not shaky, we should advise him in all cases to settle the doubt in his own favor by not bringing the suit; the chances are that there will probably be not enough of his reputation left at the end of the trial to be worth having.

---

The outflow of specie is now at full tide, the exports during the past week having amounted to $3,670,352, making the total since January 1 $26,620,327—the largest amount on record. The nearest approach to this total was in 1871, when the figures were $25,143,055, and in 1868, when they were $25,803,848. Last year we had, up to this time in the year, sent out only $13,229,608, and in 1873 $18,238,097. The chief cause of this heavy drain is the calling in by the Treasury of so many five-twenty bonds. If the European holders of these bonds were taking, in equal amount, the new Fives, or, for that matter, any other kind of American securities, of course there would be no necessity for sending gold to Europe to pay for them. Unless there is a renewed demand in Europe for our securities, an unusually heavy drain of specie from us during the summer is inevitable. The fear of a war in Europe has within the past week shown itself in the foreign money markets, and there is less reason than a week ago to expect that we shall be able to negotiate many securities in Europe this summer. During this month there are subscriptions to American loans falling due in London to the amount of only £280,000; last year the May subscription payments on the same account were £1,753,750. Naturally, therefore, there is little foreign exchange offering in this market, except such as is made against the export of coin. The New York banks now hold about $10,100,000 specie, and of this they gained $580,000 during the week—the Treasury, in addition to its heavy disbursements, having sold $1,500,000 on Thursday. Last year the banks held $27,300,000 specie. In legal-tender notes, however, the banks are exceptionally strong; they now hold $58,000,000, which is more than they have reported since last November, and is about $1,500,000 more than they held last May. These facts point to a low and easy money market during the summer, and to a possibly stringent money market next autumn, when the legal-tender notes will be wanted in the interior, and the bank reserves will be dependent on whatever specie the banks have. General trade during the week has been dull. In Wall Street, general speculation has been quiet, with the exception of an active bear movement in Erie. For all classes of investments there is a continued strong demand, owing mainly to the difficulty experienced in employing money profitably outside of securities. The New York banks have during the week taken about $5,000,000 of the city revenue bonds. These bonds are issued by the Comptroller to anticipate the collection of taxes already levied; they will be paid off in the late autumn, and bear five per cent. interest.

---

The Legislative Committee on the Canals has made its first report, and the Removal Bill has been defeated. The report has attracted very little attention, chiefly because the Governor's Commission is the only committee to which the public really looks for information on the subject, and also because the popular interest which was excited by the exposure is wearing out, and most people think they already are possessed of sufficient information as to the canals to be able to converse intelligently about "unbalanced bids," "slope" and "vertical" walls, to have an opinion upon the merits of Mr. Tilden as a Presidential candidate, and so on. We are sorry that this should be so; for the decline of popular interest deprives the Governor of a good deal of moral support, which he needs so much, and strengthens "Jarv." Lord and his fellows in their belief that, if only they can get time enough, they will carry the day and keep possession of the contracts they plunder the State with. Still, it is an inevitable phase of any reform movement; and popular excitement on the subject even of gigantic frauds cannot be expected to be of any great permanence. What we do expect, however, and what it is essential that we should have sooner or later, is some power to deal with the canals lodged in responsible hands not elected to office nor owing their appointment to any such misty body as the "people," or else the State should cut loose from the canals altogether, and dispose of them. This cannot be done, we suppose, without a constitutional amendment, and meanwhile we must have the canals at any rate taken away from the reach of the legislature, on the members of which they seem to have almost as bad an effect as the jingling of money has on a pickpocket.

---

Mr. Bowen took the stand last week in the Beecher trial as one of the plaintiff's witnesses in rebuttal, and would have made the mark we predicted for him in that rôle if more latitude had been allowed him or if his memory had served him better on the cross-examination. He contradicted Mr. Beecher in several important particulars—so important that, if his word had commonly the weight of Scripture, the defendant's case would have been irreparably damaged, at least in the opinion of the public. What his reputation is was indicated by Mr. Evarts's manner toward him, which was unusually harsh, and almost as if inspired by personal experi-

ence of Mr. Bowen's character. The point on which we had hoped the latter would shed some light was the true nature of the Tripartite Covenant; but his assertion that it had nothing to do with the arbitration of Tilton's money-claims against him is opposed both to the previous testimony and to the probabilities of the case. On the whole, his evidence could not be called ingenuous, though this might not have been apparent to the jury. His kind of moral obliquity exacts considerable study from those who encounter it for the first time; and we can never admire sufficiently the sympathetic appreciation of it shown by Mr. Samuel Wilkeson in framing Bowen's affirmation in the Covenant. It was so like this good man's own composition, it so anticipated the disingenuous defence of himself to which he would naturally resort when cornered, that it must have made him almost blush to read it fresh from Mr. Wilkeson's hand. That Mr. Beecher could, without blushing, put his name to the same paper has always seemed to us one of the least excusable of his acts in all this unmanly business.

---

A great deal has been said in the Kenealy debates on the subject of the "Prittlewell" petition—a petition in aid of Dr. Kenealy's attack on "caste," which came from a place called Prittlewell, with fourteen hundred signatures. This seemed to prove a tremendous excitement on behalf of the Claimant in Prittlewell, as did also the existence of a "Magna Charta Association," interested in the same cause and having its headquarters in Prittlewell; for it is a small place, and not much accustomed to getting excited about anything. To discover the exact extent of the popular feeling on the subject, a correspondent of the *Daily News* made a tour of inspection, and found, as he informs that paper, no traces of any sentiment whatever:

"The water-carrier who sells water from the old priory well at a farthing a pailful was going about with his old cask drawn by two long-tailed donkeys just as usual. The smith was at work in his smithy behind the old walnut-tree; the Primitive Methodists' preaching-room was being scrubbed out in a leisurely way; and at the door of the 'Peculiar People's Chapel' there was an old man consoling himself for an unmistakable touch of the east about the wind by enjoying the sunshine in a sheltered corner. But where were the banners and flags? Where were the committee-rooms? What had become of the Prittlewell Magna Charta Association—if such an institution ever existed?"

Not even in the public-houses could this correspondent discover anybody who knew or cared anything about Dr. Kenealy or the Claimant, except that if any one wanted information on that head he must "go and ask Mr. Howard." This Mr. Howard turned out to be a small grocer, who had "organized" the Prittlewell petition himself, got the signatures, and without committees or societies or associations of any kind had been fighting, in his own proper person—with the assistance of fourteen hundred obliging persons who gave him "the use of their names," apparently merely because he asked them to—the entire aristocracy of Great Britain. This seems to show that petitions for a redress of grievances may be got up in England much as they can be here.

---

An extraordinary balloon ascension recently made in France has attracted, both there and in England, a good deal of notice. The French Aeronautical Society appears to have organized it, and three aeronauts were found ready to risk their lives in an attempt to go up as high as possible, with somewhat vague scientific objects in view, or, at any rate, with a somewhat vague notion of how far scientific studies could be carried on during an aerial voyage at a distance of two or three miles from the earth. One of them, on starting, observed that he of the three who should return would be a fortunate man—and this gloomy anticipation was fulfilled to the letter, one only of the three returning to the earth alive. Few precautions seem to have been taken by the balloonists as to their physical condition, one of them having had little or no sleep for three nights, and another having taken only a cup of coffee before starting. At four o'clock in the afternoon the balloon came down, bringing with it two corpses and one man half alive to tell the story of the expedition. The balloon had gone up very high—several miles—into regions of the atmosphere in which breathing was an impossibility, and, the artificial means provided not proving sufficient for the purpose, the men died. The scientific results do not appear to amount to anything more than what we knew before—that if the air is rarefied enough, human life cannot be supported by it. We must mention also that some of the inhabitants of the village of Courmenin, who had no connection with the balloon and no interest in the scientific results, came very near being killed by the falling through the air of "an iron instrument of circular form," which was nothing else than the *aspirateur* of the aeronauts, thrown out as ballast. What is commonly used as ballast by balloonists we do not know, but in a crisis anything may be, and it is not at all pleasant to think that the ordinary dangers of life on land and sea are likely to be increased, should ballooning become general, by the chance of being suddenly killed or maimed for life by *aspirateurs*, spectroscopes, empty boxes, stones, or other kinds of ballast thrown out by balloonists in difficulties. At common law, rolling a stone off the top of a house into a crowd, and thereby causing the death of some one, would be murder in the first degree; but the legal responsibility created by dropping an *aspirateur* on the head of some inoffensive person from an altitude of eight thousand metres, has, we believe, never been settled. To complete the account of the ascent of the Zenith, it is only necessary to add that the occasion of the death of the two unfortunate men (who happened to be Republicans) was improved for political purposes, one of the orators at the funeral dwelling upon their courage and self-sacrifice as a renewed proof of the qualities possessed by members of that party.

---

There is no doubt that the Pope is infallible, but that he is not invariable has for some years been amusingly manifest. He has a weak side for Italy, and never curses her quite so heartily as he does the rest of the civilized world; and every little while he startles his stiff-necked adherents with moderate and benignant expressions which show the artificial nature of the Vatican thunder. The profane, it is said, would oftener see this phase of him if accurate reporting were in favor with the Curia; and the very fact that his most recent utterance has been permitted to go out as it stands, is regarded as a stroke of policy on the part of the more prudent managers. The occasion of it was an address by Prince Windischgrätz on the 12th of April. The Pope in reply spoke in his usual fashion, though more in sorrow than in anger, of the evil times upon which the Church had fallen, and of the duty of proclaiming to those in high places the divine retribution which was sure to overtake her oppressors. Then, by way of example, as he said, he addressed himself directly to the King of Italy, reminding him that there had been saints in his royal family, and exhorting him "with a father's affection" to consult his own interest by refusing to validate any further legislation injurious to the Church. He called the King's attention to certain features in the new penal code and in the military levy affecting priests, which tended to the Church's destruction, and concluded by begging him not to get deeper into debt with the Almighty. In the same deprecatory and imploring strain, he besought other rulers to pause in their downward course, and regretted that he had not, although the Vicar of Christ, the persuasiveness of Tertullian and other early apologists of the Catholic religion, who had practically solved the question of civil allegiance while maintaining their faith before pagan and idolatrous sovereigns, and diminishing persecution. If Christian princes would not likewise listen to him, he could only remind them of the plagues of Egypt. Such was the substance of a discourse which inveterate Ultramontanes are so far from thinking inspired that they have begun to ask themselves whether paternal feelings toward one's jailer do not furnish an argument for a non-Italian Pope as successor to Pius IX. It is, in fact, a curious paradox that to a nation as far off as Germany the Pope appears the most formidable of enemies, while at home he is wholly unfeared and mostly disregarded; and, on the other hand, that in his eyes the Emperor of Germany is one of the beasts of the Apocalypse, while the sovereign who keeps him in what he is pleased to call captivity seems not past saving, and decidedly worth a kind word or two now and then.

## THE CONTRACT SYSTEM IN PUBLIC WORKS.

TWO American gentlemen recently in London had their attention drawn to the new sewers of that city. The one, well versed in mechanical matters, was charmed with the masonry and construction, which he thought superior to anything he had ever seen of the kind. The other, who had been combating for some years what are popularly known as "jobs" and "rings," was still more charmed by finding that the construction had cost a trifle less than would have been paid for such work by private persons. During the last year, any one who has chanced to visit Washington has probably noticed in front of the Arlington Hotel a superb piece of asphalt pavement, apparently new, and at either end of it on the adjoining streets some more asphalt pavement, not superb and apparently old. If he made enquiries as to these, he was doubtless surprised on learning that that which appeared to be new is comparatively old, having been laid in the spring of 1870, while the other, which has been repaired and patched, is really new, having been down only about half the time. If the traveller prosecuted his enquiries further, he may have been astonished at learning that the worn-out pavement was petitioned for by the adjoining property-holders on account of the excellence of the former, and that the contractors who laid down the latter agreed that the worthless article should be in all respects as good as the other. But it will be a sufficient explanation for every rational American to be told that the good pavement was laid down by Mr. Corcoran, Governor Morgan, and a few other gentlemen, owning contiguous property, at their own cost and through their own contractors, and that the bad pavement was laid down by the public authorities in Washington at the public's expense, through the "Ring's" contractors.

It is this element of fraud in our public works which is creating considerable alarm and causing unknown loss. There is one class of public works where the fraud can be measured by the price, and where the loss consists almost entirely in paying more for the thing than it is worth—that is, paying more for it than an individual would pay if he had dealt with the contractor. Public buildings are generally of this character. The lumber may be badly seasoned, the brick of inferior quality, the glass defective, the ornamental work unsightly—everything charged for as first-rate may be in fact second-rate, and yet the edifice will keep the rain out and house its official occupants. Good citizens will be mortified at its poor condition, and good taste will be offended at its tawdry or shabby appearance, and still it will stand without requiring any serious outlay until, in the progress of events, we pull it down to make way for a larger or more sightly structure. But with another class of public works the conditions are different. Roads and streets and canals we begin to destroy the moment we begin to use them. To travel upon a roadway is literally to hammer it to pieces, and its durability means nothing less than its power of resistance. The excellence of such work depends almost wholly upon the honesty of its construction. Appearances when the contractor turns it over as completed mean nothing. The Washington contractors turned out a piece of work ostensibly of the same material and looking precisely like the pattern, and yet as nearly worthless as a pavement constructed of such materials could be. The price paid for the article which they agreed to furnish may not have been exorbitant, but the article which they did furnish may be little more than valueless. Hence it may be laid down as a rule, which few persons will question, that in roads, streets, and canals the public had better be cheated in the cost than in the construction.

With regard to the streets of large towns, it seems as if some effective reform must soon be forced upon city communities. Considering the heavy cost to property-holders, the inconvenience and injury to business during periods of rebuilding and repairing, the detriment to travel while they are in bad order, and the immense power which our present system places in the hands of professional politicians, it may be a question worth considering whether we cannot arrive at a system which shall take the construction out of the hands of the local authorities and place it under the supervision of the men who pay for it. In some towns, as Philadelphia, every man is allowed to do his own paving. But this is a want of system rather than a system, and the result is that the pavements are of the poorest, and that there is an unsightly patchwork of different kinds, one man laying cobble-stones in front of his house to the centre of the street, and his opposite neighbor putting down Belgian. Good roadways in town or country are essential to civilization, and the loss occasioned by bad ones is a loss which cannot readily be computed. It is indispensable to anything worthy of being termed a system that there be some directing intelligence to secure unity and a desirable result. The authorities of a town must determine the grade of the street, the width of the sidewalks and carriage-way, the depth of the gutters, and the general style and character of the pavement. It is also indispensable that there be some legal obligation imposed upon the property-holders. In small communities there may be enough of public spirit to secure the voluntary contribution of every one. But in large communities this cannot be reckoned upon, and the system which puts the work of construction into the hands of the property-holders must also carry with it the legal power of enforcing payment from each. The first step in such a system would be to divide a street into small sections, say of city blocks, and then to give the property-holders in each section the privilege, for it could not be obligatory, of selecting the contractor, fixing the price, and supervising the work, if a majority of them were so inclined. As it now is, the property-holders are responsible for the work—*i.e.*, when it falls to pieces they must pay for a new pavement, though they have not the privilege of employing the builder nor of supervising the construction. But, under a system which would enable them to contract and to supervise as well as to pay, we might expect that every one would be a very effective supervising agent, and that every contract would be as faithfully carried out as though the contractor were dealing with A., B., and C. individually. If, for illustration, our authorities should determine that Fifth Avenue should now be repaved with an asphalt pavement, the owners between Thirty-fourth and Thirty-fifth Streets might readily meet and determine whether they would do it themselves or allow the city to do it for them. If they chose the former course, and appointed as chairman of their construction committee Mr. A. T. Stewart, would not a block of pavement speedily appear on Fifth Avenue better than New York has ever seen, and would not its prime cost compare favorably with the "poultice pavement," which crumbled and dissolved almost as rapidly as it could be built?

But the general evil remains to be dealt with, and it is that the contract system has grown up to be an immense system of skilful and complex fraud. The ability and ingenuity developed in it excite surprise, just as the chemical and mechanical resources of counterfeiters awaken astonishment. People ask each other by what perversity of things it is that such talents and industry are spent in a criminal pursuit, and they are beginning to ask the same question with regard to a public contractor. The "contract system" came into fashion in this country about the time that our civil-service was falling to pieces. It was a specific designed to do away with the evil termed paternal government, and to furnish a sure remedy for getting on economically with dishonest and incompetent public officers. Now, paternal government is really a government undertaking to do things which can be accomplished by individual enterprise, and it makes very little difference whether the work be done by this agency or by that—by public officers or through the intervention of contractors, so long as it is the Government which is planning and paying. Contractors are generally men "inside politics," and there are no politicians in office more zealous and effective in caucuses and elections than public contractors. The Board of Public Works in Washington carried out all of its ambitious designs through contractors, and the contractors brought in thousands of country field-hands, and managed the political as well as the mechanical details of the city. The contract system, which has been enjoined upon us by statutes and constitutions, was really an effort to escape from danger by the simple process of running away from it. It was

perceptible to every one that if the civil-service, State and national, was to be handed over to every incompetent man who chanced to be a successful politician, public works could not be carried on directly by the Government. Erroneously it was thought that we could order our public officers to make bargains, and circumscribe them with impassable bounds; that we could secure cheapness by inviting competition; that our officials would have nothing to do with contractors, and our contractors nothing to do with politics; and generally, that we could have a paternal government in grand results, and a limited government in simplicity and integrity.

The "contract system," like everything else, has its proper uses, and, like everything else, when carried out of its limited sphere becomes a worthless or mischievous agency. How men ever could have supposed that the public officer who was not honest enough to carry on a public work, would be honest enough to enforce the rigid performance of a public contract, we do not undertake to explain. Neither can we tell for what reason it was hoped that the ignorant and incapable place-holder would suddenly become sagacious and circumspect enough to perform that most delicate task of making a discreet and effective contract. Every man who has ever built a house by contract knows how difficult it is to embrace everything and guard against everything, and how much really depends upon the honesty and business character of his contractor. Furthermore, the contract system, carried beyond its proper bounds, makes dishonesty easy; for it reduces stealing from a crime to a fraud. It lessens at the same time the chances of detection; for there is nothing so difficult to establish legally as fraudulent collusion. Half of the officials who have colluded with contractors in defrauding the State out of thousands would have shrunk from embezzling hundreds. The system as we have abused it is really one of the many nostrums of the world for making something out of nothing—for accomplishing a magnificent result without giving the inevitable consideration of honest, hard work. It has caused us ruinous outlays of money beyond any other system that was ever devised; it has produced, at its best, miserable results, and it has extended and intensified the interference of Government with the political concerns of the people to an almost despotic degree. After thirty years of trial it brings us around the circle to the starting-point, which may be briefly defined in these three conclusions: 1st, That whenever a government sees fit to carry its labors into the field of individual enterprise, it must expect to lose in money and to lose in morals, and it must understand that no instrumentality can ever be devised which will shield it from these losses. 2d, That everything in the way of public works which can be remitted to the vigilant supervision of individual citizens, disinterested, or interested only in its thorough performance, is just so much evil subtracted from the Government, and is tolerably certain of being well and cheaply done. 3d, That, as to those public works which must necessarily be done by the Government, an intelligent and respectable civil service is just as conditional to success as honest and capable agents are conditional to success in any ordinary undertaking; and that such a service can be secured only by the unwearied efforts of those who prefer the general welfare to the triumph of a political party, and are resolved to exact a decent administration of governmental affairs from whatever party chances to be in power.

## DR. KENEALY'S SUPPORTERS.

THERE is something about the Kenealy, or rather Orton, agitation in England which to lookers-on at a distance is extremely ludicrous. It has, however, for the English themselves a very serious aspect, inasmuch as they see, or think they see, in the return of Orton's advocate, *as such*, to the House of Commons an ominous sign both of the ignorance and light-mindedness of the class of voters which has been created by the late Reform Act. Whether, however, Kenealy is or is not a fair specimen of the kind of man the new constituencies are likely to take up, or whether his cause is or is not a fair specimen of the kind of causes which is likely to enlist their sympathies, is a question on which it is hardly yet possible to speculate with any profit. There is a not unnatural readiness among the opponents of the late extension of the franchise to draw conclusions unfavorable to its working, but it must be borne in mind that very little is as yet known about its working. It is only in two or three cases that the new voters have really shown any desire to emancipate themselves from the old political traditions, and it is fair, even under the most favorable circumstances, to expect a certain amount of folly and absurdity from the mere novelty of their situation. As yet, they have no policy, are hardly conscious of their power, and have furnished no means of judging what their steady bent will be. The election of Kenealy and of the author of 'Ginx's Baby' are probably the mere capering of a herd of colts which have been suddenly released from long confinement.

The question which interests foreigners is how any large body of men, with enough social training to earn their bread in a country on the whole as civilized as England, can possibly take up with fervor, or even a show of fervor, the cause of an impostor so thoroughly exposed as Orton has been. For it must not be forgotten that the question of his guilt has not been in the least affected by the bearing of the judges at the trial. The Lord Chief-Justice may have been unfair to him and his counsel, but there is and can be no pretence that the rulings materially affected the evidence in two of the longest judicial investigations on record, and before two different juries. Orton's claims were examined by a process too minute and protracted, and with too much publicity, to make the behavior of the judges of any real consequence as regards the final result. Nevertheless, there is undoubtedly a large body of the English people who do believe that the Claimant is Roger Tichborne. There is another large body whose state of mind was well illustrated by a picture in *Punch* the other day, in which one slightly intoxicated citizen, rapping his cane on the ground, says vehemently to another, who cordially concurs, "I don't care whether his name is Tichborne or Orton or Castro—what I say is, that I don't like to see a poor fellow kept out of his property."

The explanation of the muddle is, as it seems to us, simple enough. It does not arise, as many people seem to suppose, out of any new or deep-seated hostility of the populace to the aristocracy; indeed, the nature of the Claimant's pretensions makes this theory almost absurd. Earnest republicans are not ready to rise in revolution over a dispute between pretenders to a throne, and ardent democrats are apt to find better materials for an agitation than the claims of a butcher to a baronetcy. The more intelligent of Orton's supporters are persuaded of his genuineness simply because the proofs he offered in support of his claims were such as they were capable of appreciating, while those which were offered against him were such as they were not capable of appreciating. His triumphs, it will be remembered, were all achieved at the moment of his first appearance, and they were of a kind that was likely to strike the popular imagination. He was, in the first place, "recognized" by Lady Tichborne as her long-lost son, and with the aid of this incident, and of the cramming he had received about Sir Roger's history, he was able to carry by a sort of *coup de main* the recognition of some officers and men of Sir Roger's old regiment and of a few other persons. These things constituted to ninety-nine ignorant men and women out of a hundred a palpable, glaring demonstration of his good faith, and the popular disposition to believe was stimulated by what appeared to be the romantic, but by no means improbable, nature of his career. The young nobleman who goes off in quest of adventures, and conceals his rank in order to enjoy them in greater perfection, and marries the low-born girl of his heart, and then turns up to claim his patrimonial acres at the right time, is not only an attractive character, but one with which the frequenters of cheap theatres and the readers of popular fiction in England are very familiar. Thus far, therefore, Orton had everything in his favor, and secured a place in the popular heart from which it would have been difficult for *any* kind of proof to oust him.

But the kind of proof which was brought against him on subsequent investigation consisted, in the main, in the application of

tests the force of which was only visible to educated men and women, or, in other words, to the upper classes of English society. It was shown that he did not know things which a person in Sir Roger Tichborne's position would be sure to know, and that he had forgotten things which such a person would be sure to remember; but the cogency of this kind of proof was not perceptible to English peasants or mechanics, owing to their ignorance of the manners and customs of the Tichborne circle. Orton's educational defects, too, fatal as they were to his pretensions in the eyes of professional and university men and members of Parliament, were mere trifles to the persons who voted for Dr. Kenealy. That he should have been educated at Stonyhurst and have not only forgotten all about the "Quadrangle," but not have known what a quadrangle was, was incredible to an Etonian or Harrow boy, or, in fact, to any boy who had "school days" to look back on; but to a man who had worked in a mill or colliery from the age of six, and who did not himself know what "a quadrangle" was, it was the most natural thing or the most trifling thing possible. In like manner, his peculiar translation of the Latin motto, "Laus Deo semper," was nothing surprising to a man who had never learnt Latin; and his total loss of French, after having used it for twenty-five years as his mother-tongue, was a very conceivable misfortune to a British mechanic or small tradesman, who thought French awfully hard to learn, and therefore very easy to forget. We might, in the same way and with the same result, run over a large part of the evidence which ruined the Claimant's hopes in the eyes of the educated British public. It would be found to be of a kind which the constitution of English society and the depth of English popular ignorance deprived of all weight in the eyes of "the masses."

With the small-shopkeeper class, in which the Claimant has many supporters, another influence, in the shape not only of a profound hatred of "Popery," but profound belief in the capacity and unscrupulousness of the Jesuits, has also told in his favor. The upper classes in England have of late years, and not without some show of reason, incurred great suspicions among the lower middle-class of a leaning to Catholicism; and the fact that Orton was a jolly fellow, who had emancipated himself from ecclesiastical influences in the Australian bush, and that the estates were held by a fatherless infant minor whose mother was presumably surrounded by priests, was enough of itself, in the eyes of a great many of that half-taught and narrow-minded class which in every country most faithfully preserves the national traditions, to make his cause the cause of all true-born Englishmen, and his defence a protest against the introduction of "Popery, brass money, and wooden shoes." The power of this old and, in its origin, not ignoble prejudice is well but comically displayed in one member of Parliament, the pious Whalley, who has supported the Claimant faithfully from the beginning, and firmly believes that the trial was directed by the Roman Propaganda. The working of English public opinion about the affair, in fact, furnishes a social study of greater interest than Orton's own career.

## ENGLAND.—TORY MISMANAGEMENT.

London, April 24, 1875.

MR. DISRAELI is trying the patience both of the House of Commons and of the country at large by his eccentric conduct of public business. He has thought fit to take up the rôle of Lord Palmerston, but, up to the present time, with only partial success—his sardonic appearance, his enigmatic turn for mysterious surprises, and his unaffected satire being incongruous elements in a make-up of one whom England delighted to reverence as "jolly old Pam." I never see him in one of his Palmerstonian poses without being reminded of a current anecdote of the times. A new religious sect has sprung up in this country—I dare say you may have branches in America—called Devotionalists. Their tenets, so far as I can comprehend them, seem to combine the extremes of Spiritualism with the extremes of Evangelicism. At one of their recent functions it is narrated how a lady was troubled by a large portrait of Lord Palmerston in the room, which always followed her with its eyes, and, as she imagined, winked at her during the most thrilling moments of the ceremonial. Mr. Disraeli must be grateful that he is not confronted with a similar phenomenon in the House of Commons. If anything could perturb his composure it would be the continual presence of such a dumb witness of his eccentricities, winking in silent criticism at his strange manœuvres. But, in the absence of any such troublesome agency, Mr. Disraeli goes down night after night to the House of Commons, whose serious deliberations he is supposed to conduct, and, having assumed the comic mask of his predecessor of ten years ago, with a mocking air which sat so cheerily on Lord Palmerston but so differently upon him, confounds both friends and foes by the audacity of his sallies and the jauntiness of his jests.

This did well enough just at first. Members who had heard with unfeigned anxiety alarming rumors as to the Prime Minister's health, welcomed his quizzing way as a practical contradiction to the rumors. But they begin to think that they have had too much of this sort of drollery, and even to cast back some longing looks towards the days of the Gladstonian dispensation, when it was all work and no play, and when earnestness unrelieved by the faintest glimmer of merriment was the order of the day. Just consider the proceedings in the lower House since the reassembling of Parliament after the Easter recess, three weeks ago. How have the best hours of almost every day—the hours, namely, between half-past four and dinner-time—been occupied? While grave questions, involving possibly the peace of Europe, have been discussed in most of the legislative assemblies on the Continent of Europe, what have been the subjects of the deliberations of the British House of Commons? The Government have been spending hours wrangling with Dr. Kenealy about the reception of a petition from an unknown village, prepared and manipulated as such things can be by an illiterate publican in the interests of the convict Orton. The thing should never have been noticed, and no human being would have heard of its existence. Mr. Disraeli, however, thought otherwise. He made up his mind to regard it as a matter affecting the stability of the constitution, and invested it with a factitious importance which its own merits could never have secured. During these same three weeks the supporters of the Government, and notably a country member called Sir Lawrence Palk, have been openly endeavoring to burke an enquiry, set on foot by one or two members of the late administration, into some of the glaring corruptions of the City; and the Government, led on by the First Minister of the Crown, instead of resisting these endeavors, have thrown the weight of their majority and their influence into the same scale with them, and have encouraged their supporters to sacrifice hours of valuable time in unseemly squabbles about the privileges of the House. Personalities, trivialities, questions of privilege, wrangles with Kenealy—these are the matters that have engrossed the attention of Government and the House of Commons, while the diplomatic relations of the Great Powers have been hanging in the balance. And when Mr. Disraeli was questioned, during one of the more lucid intervals, on these relations, shortly after the reassembling of Parliament, he thought it consistent with his own dignity and with the dignity of a great country to snub the questioner, and to shelter himself from an awkward interrogatory behind the laughter of his followers who sat around him, and are ever ready to play the *claque* to all his sallies.

In the early days of the session this sort of polished buffoonery did well enough. Members of Parliament felt that they had several months before them to get through the legislation of the year. But here we are close upon the Whitsuntide recess with next to nothing done, and no abatement to the Christmas pantomime which has usurped the place of the sober work of the session. Members are getting weary of a constant pantaloonade. "The work of the House of Commons," as one of them said to me the other day, "under this Administration, reminds me of nothing but a bad breakfast at an inferior French restaurant. You know the sort of thing—radishes, olives, prawns, crayfish, and the like, to whet the appetite—'fiddlings,' I call them—and then the substantial food at the end, when you have had so much of the 'fiddlings' that you cannot touch it." It is all "fiddlings" in the House of Commons nowadays, and when the substantial food comes on no one remains to take part in it. In the old time, when Mr. Gladstone was Chancellor of Exchequer—nay, even when Mr. Lowe was Chancellor of Exchequer—the House used to be crowded to the doors on the budget night; the lobbies were full of politicians and mercantile men, thankful for the faintest echoes which came out to them; and places in the galleries were bespoken for days, and occupied at the earliest moment. Last Thursday week the budget was introduced. But before it came on, a motion was made by the Prime Minister on a question of privilege, and the petition for the release of Orton was debated with all the solemnity of a vote of confidence previous to a ministerial crisis. The House was crowded

enough during these discussions; but when Sir Stafford Northcote rose to unfold his budget, the House and galleries were cleared, the lobbies left untenanted, and he spoke for two hours, elaborating a great scheme for the payment of the national debt, to a sleepy gathering of about fifty members. The "fiddlings" had been too much for the representatives of the people, whose main duties, theoretically at least, are fiscal; and, exhausted by the personalities elicited by the discussion on the question of privilege and the release of a convict, they left the taxation of the country and the national debt to take care of themselves.

But it is not only in the conduct of the formal business in the House that the tendency to frivolity and trifling is so manifest. In the graver matters of legislation the determination to play at law-making rather than to work at it prevails. The Queen's speech, as you will remember, was full of promises of beneficial reform, and many, I myself among the number, were deluded into the belief that it would be a useful session, and that the administration, with its "despotic and insolent majority" (to borrow the epithets addressed to it on Thursday by The O'Gorman), intended to leave its mark on history as an administration which had put to rights many domestic grievances of a real and tangible kind. These hopes have been blighted for this session. The severe winter which has made such havoc with all green things has not spared the ministerial blossoms. It has nipped them all, and the prospect of fruit is nil. The measures, as Lord Granville put it the other day in the House of Lords, have, one and all, been like the painted balloons which children play with in the street—very pretty to look at but without anything inside them. A measure was introduced to clear away the city "rookeries," and give good cottages to the artisan classes. But the bill contains no adequate machinery to set the authorities in motion to carry out these clearances, no provision for the rooks when cleared, and no certainty that the new cottages will ever be built. Another measure proposes to take in hand the accounts of friendly societies, and prevent the poor from being robbed by the officials connected with those societies. But the officials are to audit their own accounts—"The cat is to watch the cream," to quote Mr. Lowe's criticism—or leave them unaudited if they prefer to do so, and the poor are to go on being robbed as heretofore, the only difference being that the robbery is henceforth to be carried on under sanction of an Act of Parliament. Dazzling promises are dangled in another bill before the eyes of the tenant-farmers of England and Scotland. They are offered compensation for improvements made by them in their farms, longer tenancy than formerly, and a better tenure of their holdings. These simple acts of justice sound satisfactory; but by a sweeping provision at the end of the bill any landlord may, by an ordinary writing under his hand, withdraw himself and his farms from the operation of the act, and so leave his tenants in the lurch; and it was announced in the House of Lords that the great majority of landlords had already made arrangements to take advantage of this provision if by any chance the bill became law. We were promised a bill to put a stop to the pollution of rivers, which would secure pure drinking water for the lieges and unpoisoned streams for the fishes. But the manufacturing interest would have been alienated from the Government if such a measure had been pressed, and so we have heard, and shall hear, no more of it. The courts of justice, again, in the United Kingdom were to be put in harmony with the times, and the obsolete jurisdiction of the House of Lords as a court of appeal was to have been abolished, and a bill was introduced for the purpose both last session and this, the measure being really the coping-stone upon the legislation of the previous Government. But a caucus of Tory peers and lawyers met in some obscure house in an obscure street near Lord Salisbury's residence upon a Saturday, and on the following Monday the Lord Chancellor announced that the bill was likely to meet with opposition, and therefore the Government had no alternative but to withdraw it.

I need not weary you with further instances to prove that, both in the formal conduct of affairs and in the grave matters of legislation, Mr. Disraeli and his Government are not maintaining their position in the estimate which was formed of them. The superstition prevalent in England, and, like many more deeply-rooted superstitions, sedulously fostered by the Tory party and the Tory press, that Mr. Disraeli, in the rôle of Lord Palmerston, is a heaven-born leader of the House of Commons, is fast dying out. People are awakening to serious doubts of his infallibility. It does not require a Political Expostulation to proclaim it to the world. He makes small mistakes almost every night, and large ones almost every week. But he has the knack of recovering himself by a happy hit from time to time, and these recoveries prolong the death-bed of the superstition of his infallibility. On Thursday last, by snubbing Mr. Sullivan when he asked a modest question as to the proposals of Government upon the anomalous relations of the House of Commons and the press, he committed a grave error. Mr. Sullivan is an Irishman, but he is also the proprietor of a newspaper, and there are several other proprietors of newspapers in the House, some of them not uninfluential. By snubbing Mr. Sullivan, when a civil answer would have satisfied him, Mr. Disraeli offended all these men, and, unless Lord Hartington had come to the rescue yesterday, and offered to bring the matter formally before the House, reporters would have been excluded for the rest of the session, and, putting the matter on the lowest grounds, the public would have been deprived of their morning reading.

Mistakes like these soon begin to tell against an administration. From the recent by-elections, it has been made manifest that the feeling in the country is turning back, slowly perhaps, but surely, to its natural current in favor of a Liberal rather than a Tory management of affairs. In the House itself, the division of last Wednesday on the second reading of the bill to permit Dissenters to be buried according to their own rites within the precincts of the parish church-yards is looked upon by many as full of happy augury for the party in opposition. It will seem strange to you in America that Englishmen should, in this the latter part of the nineteenth century, still persist in excluding the bodies of those who have not been baptized according to an Episcopal ceremonial, from burial in the church-yard of the parish according to the observances of the Dissenting sect to which they belong. But such is indeed the case, and it seems impossible to make it otherwise. For some years past, efforts have been made to provide a remedy by law. But the church is too strong. In former sessions the bill has been always thrown out by considerable majorities. On Thursday, in one of the largest houses of the session, it was again thrown out, but only by a majority of 14—238 voting in the minority against the Government. The question was no doubt a good one to bring together the forces of the Opposition. But the number of defections from the Tory to the Liberal side, and the number of Tory absentees, in the face of strong Government pressure, indicate that some of the Ministerial team are not sorry to take an opportunity of kicking over the traces, even at some risk, if not of overturning, at least of shaking, the Ministerial coach.

## BELGIUM AND GERMANY.

PARIS, April 23.

NEUTRAL countries are the dangerous places in our old Europe, where the Great Powers make their trials of strength before the great struggles of war. The Crimean war did not break forth suddenly: it began in the Holy Places, which constitute a sort of neutral ground, divided between the various Christian communions. Every time the name of Belgium is pronounced, Europe naturally becomes uneasy. Belgium ought to be always, like good children, seen but not heard. It is not to be wondered at if the recent exchange of diplomatic notes between Prussia and the Cabinet of Brussels has produced much uneasiness in Europe. The text of these notes is now before the world, and there is not much to be said about it from a technical point of view. Germany complains of some attacks made against her sovereign, not only in the Belgian press, but by persons who are under the control of the Belgian Government, these persons being no less than the Catholic bishops of Belgium. The German note at once touched the difficult question of the relations of church and state, and gave a weapon to the Opposition, as the Catholic party is now in power at Brussels.

The question was brought only two days ago before the Parliament at Brussels in a very practical form. Monsignor Deschamps, of Malines, is among the bishops who were promoted some time ago to the rank of cardinal at the same time as Archbishop Manning. There is an old decree of Messidor, in virtue of which some military honors are due to the cardinals in Belgium, and the Catholic ministry, headed by M. Malon, ordered these honors to be rendered to Cardinal Deschamps on his return to Malines. The Opposition objected to this, by the mouth of the late Minister of Justice in the Liberal cabinet. How can you tell the Cabinet of Berlin, he enquired, that the Belgian bishops are not public functionaries, if you recognize them as such yourselves? and how can you say that you are not responsible for their sayings and doings? In virtue of the Belgian constitution, which is posterior to the decree of Messidor, church and state are kept quite separate in Belgium. The Cabinet made a very feeble answer; but a member of the Catholic party, who bears a name dear to all patriotic hearts in Belgium, reproached the Liberal Opposition with being in alliance with the "triumphant force which rules in Berlin."

The waters, as you see, are much troubled in Belgium. So they are in Italy. I was speaking a few days ago with an Italian gentleman of great distinction, who said to me: "We intend to remain faithful to the noble motto of Cavour, 'Libera chiesa in libero stato.' During the last wa-

between Prussia and France we entered Rome without the help of any foreign power, and we voted in our Parliament the law which is called 'the law of guarantees,' which allows a complete spiritual independence to the Church of Rome. After this law was passed there was a Cabinet council, in which it was discussed whether we should or not make a diplomatic communication of this law to foreign powers. After much discussion, it was decided that we should not; we considered the question of our relations with the Pope and the Church of Rome as a purely internal question, and we did not wish to give any power the right to express an opinion on the solution which we had freely found for this question." I asked my interlocutor if the Italian Government intended to remain on that ground, and he told me that he thought it would. Italy wishes to keep for herself all the advantages of possessing in its new capital the spiritual head of the Catholic Church, but in virtue of the law of guarantees she will not bear the responsibility of the action of the Pope. This position is a very difficult one to maintain. Deprive the Pope of all his provinces, as long as you leave a square foot on which he can stand, and stand independently, he will be in a spiritual sense as independent as ever. The actual Pope has not, in my opinion, overstepped the limits of the power which the confidence of the Catholic Church has placed in him. He spoke a short time ago with much moderation of the sovereign who has deprived him of his provinces; he reminded Victor Emanuel that there had been saints in his family, and seemed to offer him the olive-branch of pardon. Strange as it may appear to many, there are bonds of secret sympathy between him and the head of the House of Savoy.

But suppose for a moment that a Pope comes forward animated by the spirit of old times, who speaks to the new German Emperor in the style of the Middle Ages, and uses such words as are used in all bulls—"Race of vipers, serpents, etc.," what will the German Emperor do? He will ask the King of Italy to shut the mouth of the spiritual sovereign who would excommunicate him and sunder the bonds of fidelity between him and his Catholic subjects. And if the Italian King says that he cannot do so, the German Emperor will, like some of his predecessors, ask leave to do it himself; he will claim the right to go himself to the Vatican and to punish the offender. Renan, who is so much hated by the Catholics since his 'Life of Jesus,' remarked to me yesterday: "The Germans have never understood the force of the spiritual power; their ideal is not the Catholic ideal, superior to all questions of race, of color, of nationality. Bismarck speaks of the Pope as a man who only believes in the force of strong battalions. He comes forward, not as an infidel, an unbeliever, an exegetist; he would be sorry to see the Germans become a nation of philosophers. What does he really want? It is to make of his master a new Pope, an evangelical Pope. He would not like to suppress the Catholic Church in Germany. He would be satisfied if Catholicism was reduced to ceremonies and to the preaching of the famous formula: Give unto Cæsar the things which are Cæsar's. He hoped that under the excitement created by the war he could reduce the Catholic clergy of Germany to mere tools of the German Emperor; he has found that there is a passion even stronger than patriotism, more irreducible, more impenetrable; and in his wrath he is taking measures which go directly against his object. The Catholic churches, which were much neglected, are now full in Germany; all the forces which are hostile to him have taken the Catholic flag. A real crusade has begun, and who knows who will be the conqueror?"

I repeat to you what I hear, confessing that I feel much perplexed at the present aspect of things. I could not have imagined a few years ago that the *rabies theologica* could have seized the men of my generation as it has done lately. The character of Prince Bismarck seems to be a riddle. It becomes more and more clear to me that he does not belong to the ordinary class of statesmen; what he has done is something almost stupendous, but it seems as if all he has done were only a stepping-stone for something else. He is aiming at nothing else than the destruction of an immense church, which counts millions of adherents in all parts of the world; and he has so entangled the spiritual question with the ordinary rivalries of nations and races, that the world may feel itself on the eve of a hundred-years war. I have been told that the intolerance and impetuosity of his character are such that he cannot look with patience on a Catholic priest or ceremony. He would not say, like your serene Emerson,

"I love a priest, I love a prophet of the soul."

No; he is the representative of a high-and-dry state, surrounded with an army, a police, and with functionaries and professors who have become the functionaries of the mind. And a great country is adopting this ideal; the National Liberal party can no longer see anything except through this prosaic ideal. Fifteen hundred thousand men stand ready to fight for it at any moment; and the law of nations, which hitherto has only been intended to stop the movements of armies and of fleets, will now be remodelled so as to become the instrument of it.

I said a few days ago to a diplomat: "How is it that you have always claimed for neutrals the right to deal in all the materials of war: to sell powder, charcoal, arms, cloth—all that goes to constitute an army and a fleet? You have only objected to the actual instrument of war, all ready for action, which could leave the neutral territory or the neutral waters and take part in the struggle. You have not thought it possible in the present state of the world to do more than this; and now you are discussing quietly the means of stopping the expression of hostile thoughts. Louis XIV. made war on Holland, but he could never hinder the Dutch presses from publishing the innumerable pamphlets directed against him. Has the world become so small since the invention of telegrams and railways that there should be a sort of international police, and that the strongest power can make itself feared and obeyed throughout the world?"

My personal feelings may blind me in this case. I have often been offended abroad by the coarse and brutal expression of hostility to my country. Only this summer, I remember buying before the Cathedral of Milan a pamphlet in which MacMahon was attacked with the most cruel animosity. I read in it that he had never been wounded at Sedan; that he made believe that he had been, in order to avoid the responsibility of the capitulation. I have read in England the most outrageous libels against all the potentates of the world. I have never opened the *Times* without reading some article which might have become the subject of a diplomatic correspondence if governments could be made responsible for the press. And I ask myself in all sincerity: what the meanest reporter can do, what an anonymous journalist does every day of his life, shall I refuse this to a man merely because he is a priest, because he has a faith and defends it, for the reason that he receives a pittance from the state? Under Napoleon III., some bishops in France delivered charges on the Roman question; and he allowed himself to be compared to Diocletian, and to the worst Roman emperor, by men who were actually salaried by his government. He was right; generosity can hardly be excessive when it is applied to men who, though they may fight for a bad cause, do it for honorable and noble motives. But I dare say I am behind the times; we have entered an age of iron and blood, and generosity is not the order of the day. *Væ victis* has become the motto of our age. The religion of force is dominant; it has so many devotees that it may perhaps be more indulgent towards the religions which can only wield spiritual weapons.

How strange our struggles must appear to you across the Atlantic, and how jealous we might feel of a country like yours where truth believes in its own intrinsic value, and is not dependent on the powers of the state. Our Old World, with its five millions of men in arms, its kings and its republicans, its decayed aristocrats and its corrupt democracies, has become an object of pity and of terror. It is always ready for new convulsions, and it can find no rest. Old statesmen who have fought a lifetime for religious liberty are now attacking it, consciously or unconsciously; sovereigns have become the propagators of revolution; and revolutionists have made themselves the instruments of a new tyranny. "Alas!" said one of my friends a few days ago, "I have spent my life in being more conservative than our millionaires, more royalist than our royal princes, and more French than France!" Victor Hugo has called the year of the war "the terrible year"; every year has now become so to a patriotic Frenchman. We see the storm gathering round us on all sides; we are obliged, in order to save ourselves, to tie our fate to things condemned by destiny.

## CONSTITUTION-MENDING IN PRUSSIA.

BERLIN, April 26, 1875.

*KLADDERADATSCH* has a picture representing two men, one snuffing the air and saying: "There is a smell of something burning, like powder"; the other answering with an ironical smile: "Only newspaper" (*Zeitungspapier*). From a certain point of view there is no objection to seeing the war-alarm treated in such a manner even by that part of the press whose vocation it is not to crack jokes and manufacture puns. For a long time business of every kind has been, all over Germany, in such a condition that any alarm is to be seriously deprecated. It is therefore a matter of congratulation that, thanks to the exertions of the press, the uneasiness created by the letter written to the Cologne *Gazette* "from Vienna," and more particularly by the famous article of the *Post*, has almost entirely disappeared. Yet it is even more certain now than at first that the latter had its origin in the office of the Chancellor, and that it was meant to be a warning hint to the supposed eventual "Catholic League" of France, Aus-

tria, and Italy. The journey of the Crown Prince is, contrary to the first intention, made "in the strictest incognito," and those who are not without experience in such things point to this as a further proof of a significant reserve in the attitude of our Government towards Italy. The letter of the Emperor to the King, and the rumor, busily circulated by the press, that the former is still thinking of going some time to Italy, these political augurs are inclined to take merely as signs that the German Government has not yet renounced the hope of renewing the friendship in all its former cordiality and sincerity. The same view is pretty generally taken with regard to our relations with Austria. Yet there is a feeling that the air is filled with mists which, at not too distant a day, may form into clouds. The main reason of this belief is the conviction that in Austria, as well as in Italy, there are powers at work which render it quite possible that, under certain circumstances, their policy will not be decided by their obvious interests and according to the wishes of the majority of the people when in a sober mood, but by the rancor and the ambition of a faction or a momentary impulse of the passions of the day. One of the principal questions is, how much skill the Vatican and France will show in playing on these strings.

On the other hand, one also very frequently meets with the opinion that Bismarck overshot the mark in the article of the *Post*, allowing himself to be carried away by his nervousness and irascibility. In the same circles—and they are decidedly friendly to the Empire and to the Chancellor—the course pursued by him towards Belgium has caused much regret, and is ascribed to the same reasons. They refuse to discuss at all the merits of the principles involved, simply saying that it is unworthy of a great power to make a fuss about such things; Bismarck should consider Germany so strong that she can afford not to notice the kicking of the Belgian Ultramontanes. My impression is that the public are really gratified to learn that this comedy of "much ado about nothing" has come to an end, and one often hears the wish expressed that the Prince were less apt to lose his temper.

With regard to the question which becomes every day more and more the all-absorbing one, this reproach does not apply, though it would perhaps sometimes be better if Bismarck were somewhat more guarded in his language. It was my good fortune to be present at the delivery of his two great speeches in the House of Representatives, on the motion of the Government to strike out Articles 15, 16, and 18 of the Constitution. A picture of more absolute calmness and at the same time utter firmness and resolution, could not be imagined. To have heard and seen him on this occasion, and to harbor any doubt that he feels as if he already had the final victory surely and safely in his pocket, is impossible. The majority of the House showed the same temper, the most violent thrusts of the Ultramontanes exciting only a good-natured hilarity. But though one entirely approves of the motion and of the temper in which it is being carried through in both Houses of the Landtag, one cannot help feeling a deep concern in looking beyond the immediate future to a more distant day. The most important of the three articles in question is the first, which provides that the regulation and management of their internal affairs shall be left to the different churches; the second leaves free the intercourse between the clergy and their ecclesiastical superiors; and in the third the state renounces, with certain limitations, its rights of patronage. At first view, all the three articles appear to be dictated by a spirit which every liberal-minded man would and should be exceedingly loth to disavow; in fact, however, they have from the first never served any purpose but to promote the pernicious pretensions of Rome. The reason of this is very plain, and it is stated with great precision in the "motives." Article 15, of which Articles 16 and 18 are but applications, is, to borrow an Americanism, a "glittering generality," and therefore any consequences one pleases may be tortured out of it. This is what the Ultramontanes have been doing from the first, and what they would go on doing to the end if the article were allowed to stand. At first they affected to believe the expression "church" to mean not the concrete religious association and corporation, but the mysterious abstraction which, in their creed, is called "the church." Now, as this "church" is as high above the state and the whole world as the sky is above the earth, it was of course not for the state to decide what are and what are not internal affairs of the church. In this respect the state had to receive the law from the church, and, since the Œcumenical Council, the law of the church is the *dixit* of the Pope. Bismarck spoke the sober truth when he said: "By our constitution—*i. e.*, since we are constitutional—there is in Prussia hardly anybody personally and autocratically so powerful as this high Italian prelate, surrounded by his council of Italian priests." And "the firm point" on which the levers for the erection of this *imperium in imperio* have been fixed is the "glittering generality" of Article 15 of the constitution. The striking out of Article 15 does not mean that henceforth the internal affairs of the churches shall not be regulated by themselves; it only means that the relations between the state and the churches shall be determined by special laws, so that it can no longer, in any given case, be a debatable question what are the internal affairs of the churches which by the laws of the state are left to their own regulation. Bismarck called this "the way to peace," on which it will be possible "to change the aggressive warfare into which we have been forced for a while into a defensive one, leaving the aggression more to the enlightening influences of the schools." It is the way, and the only way, to real peace; for without certainty of the law there cannot be peace, and there is no possibility of the law being certain so long as it is left doubtful where the power of ultimate decision of the questions in dispute rests. This power, which the state had never intended to renounce, but which to a great extent had been actually wrested from it by means of these three articles of the constitution, is now reclaimed in such a manner that the possibility of a foul truce is precluded. The state is irrevocably binding itself to know but one way of ending the war—viz., the full acknowledgment of the supremacy of the laws of the state on the part of the Ultramontanes. This has nothing whatever to do, as the Ultramontanes are pleased to pretend, with the question of religious liberty. Article 12 of the constitution remains untouched, and that secures to everybody "the liberty of his religious creed" and the liberty "of associating in religious societies." It is not in this respect that exception can be taken to this last and, as I think, decisive stroke of the state. The weak point before alluded to, which in the course of time might easily grow into a serious danger, lies in quite a different direction.

Every liberal-minded American will applaud the Chancellor's declaration that, in a short time, he hopes to be so far along that "the aggression can be left to the enlightening influences of the schools." But the Chancellor, as well as the majority of the Landtag, has failed to propose doing the one thing without which it is impossible to attain this desirable end. Article 24 of the constitution lays it down as a principle that, as far as possible, the confessional character of the schools shall be maintained. Remember the untiring exertions of the Catholic clergy in the State of New York to get a part of the common schools into their hands, and the earnest warnings addressed by you to the people not to let this plot succeed, and you will readily agree with me that this Article 24 leaves to the Prussian Ultramontanes the very citadel of their power. This opinion was forcibly urged in the caucus of the National Liberals, but the proposition to introduce a motion in the Landtag that Article 24 should share the fate of Articles 15, 16, and 18 received only the vote of the mover, although the great majority of the party certainly do not controvert the correctness of the principle involved in the proposition. This action of the party seems to me to indicate a really alarming political shortsightedness, the consequences of which may be of a very grave character. It appears to me in the highest degree likely that, in a very short time, the Government will be forced to move, in response to the continued resistance and attacks of the Ultramontanes, the striking out of this article. The majority of the Landtag will then, as readily as they are now doing, adopt the proposition of the Government, but in doing so they will sap one of the most important principles of true constitutional liberty, which they would leave comparatively unhurt if they were to strike it out now, together with the three other articles. It is the worst feature of our constitution that the changing of it is as easy a thing as the passing of the most indifferent law, and that the people at large have no influence whatever upon it. A change of the constitution is effected by the concurrence of the King and the two Houses of the Landtag, only 21 days being required to elapse between the different stages the bill has to pass through. Dr. Falk, answering Mr. Richter of Sangerhausen, thought the concurrence of the "three factors of legislation" an amply sufficient security against hasty and pernicious changes of the fundamental law of the state. Would you, looking at the experience of the United States, admit the correctness of this assertion? It is a constitutionalism of a rather doubtful character not to permit the people at large to participate in the decision of the most important questions which possibly can be presented to any people, by at least holding a general election between the proposition and the adoption of a change in the fundamental law. But there being as yet no chance of getting thus much conceded, our representatives should at least do everything in their power to prevent the establishing of a loose practice with regard to the changing of the constitution. We are in a state of war, and the liberal parties are entirely agreed that a purification of the constitution is needed, but a clean sweep should be made of all the untenable and obnoxious provisions.

There is perhaps no greater danger for the consolidation and growth

of real constitutional government in Germany than for the people to get in the habit of regarding the constitution as an instrument, the single articles of which may be thrown overboard with a light heart whenever they are found to work badly. And there is danger lest the Government, the Landtag, and the people get deeply involved in this dangerous way just because we are in the midst of a war of enormous magnitude, the exigencies of which are apt to present further changes in an exceedingly plausible light. This danger is considerably increased by the great superiority of Bismarck over the other members of the Cabinet as well as over the members of the Landtag. It is true the conservative bent of his mind affords a certain guaranty; but on the other hand he is as revolutionary as he is conservative, and his temper makes him more inclined to short and sharp cuts than to the slower and more laborious but safer process of disentangling. His genius and his good luck may carry him safely through all difficulties to the last, as they have done heretofore; but he will have entailed on the people a bad inheritance if he accustom those who have neither his genius nor his good luck to consider this the best manner of dealing with political problems, the satisfactory solution of which can only be the fruit of the best and most strenuous exertions of generations. My ambition is not to play the ungrateful part of Cassandra; I have full confidence in our future, but we are far from being out of the woods.

# Correspondence.

## PACIFIC MAIL AND ITS SUBSIDY.

To the Editor of The Nation:

Sir: In view of the evident purpose of the supporters of the Pacific Mail Steamship Company to use every effort to secure a renewal of the portion of the subsidy withdrawn by the recent act of Congress, will you kindly furnish us, through the columns of your valuable paper, some information as to the extent of the obligation of the people of the United States to that Company, which must of course be made the basis of an application to Congress? If the Company has, while doing a really good work, forced the country to pay an extravagant price for it, the weight of the obligation would certainly not seem oppressive. Aside from the gift of the subsidy, it seems to some of us that the people of the United States have contributed a sufficient amount to the treasury of the Company to enable it to return very respectable dividends, notwithstanding some severe losses.

It is often said that the Company is obliged to demand high rates for freight and passage on account of the light cargoes which the outward steamers carry through the scarcity of freight for China and Japan. If this is true, why is not some effort made to encourage shippers? There are now four sailing-vessels en route for Japan, and probably more than as many more for China; and there is no doubt but that a large part of the cargoes of these vessels might have been taken by the steamers of the Pacific Mail Company had they cared to reduce their rates; but, instead of so doing, freight by steam from New York to Japan has been as high as $40 and $50 gold per ton, against less than $16 from London to Japan. After making all due allowance for the unsettled state of business on the comparatively new route, it certainly ought not to cost nearly three times as much to transport cargo from New York to Japan as from London. The necessary inference would seem to be that freight is not, and of late has not been, scarce.

As to homeward cargo, the problem seems to be how to find room for it on board the steamers. Though two steamers per month have sailed for San Francisco the past year, freight has accumulated at the Asiatic ports. Even now, in what is usually considered as the dullest season of the year, the *City of Peking*, large as she is, will leave over 500 tons of freight at the port of Yokohama alone.

Owing to the nearness of the American market and to other reasons, it has been possible to open a very promising trade in American drugs and hardware, notwithstanding the exorbitant rate of freight; but, since the recent combination of the Pacific Mail Steamship Company and the railroad companies, telegrams received indicate a very great increase in the tariff. One telegram puts the rate of freight apparently as high as $80 per ton. What chance have our American merchants and manufacturers to compete with those of England and the Continent against such odds? Does not this rate mean the almost entire suspension of trade in American goods, excepting so far as it can be carried on by means of sailing-vessels? Before this combination, relief might have been looked for from English steamers; but, with the railroads against them, English capitalists will hesitate about entering upon so hazardous an enterprise.

Is it wise to strengthen the hands of a combination which threatens to inflict so serious a blow upon American commercial interests? In case an additional subsidy is granted, would it not be well to offset it by another to the merchants, tea-drinkers, etc.? The latter should in justice be five times as great as the former; and if it should be intended to cover constructive damages to the American trade, no one but a Fourth-of-July orator would venture to compute its proper size. An American.

Yokohama, April 9, 1875.

# Notes.

THE pirating of the 'Encyclopædia Britannica' by a Philadelphia house has compelled resort to the same measure of protection adopted in the case of 'Chambers's Encyclopædia,' viz., the insertion in future volumes of copyrighted articles by American writers.——A club whose object is "the association of authors, artists, and men of science, and amateurs of music, letters, and the fine arts," has just been formed in Philadephia. It is called the Penn Club, and is limited to two hundred members.——In the same city, the committee on public health of the Social Science Association has memorialized the General Assembly in behalf of a State Board of Health. A bill to create such a board was favorably reported to the Senate at the last session, but failed to become a law.——The Centennial Exhibition will, in addition to its line of agricultural implements and machinery, undertake a display of live stock (chiefly in September and October) and of fruits. Enquiries should be addressed to the Chief of Bureau of Agriculture, Philadelphia.——J. B. Lippincott & Co. have in press a new edition of 'The Romance of Natural History,' by Philip Henry Gosse; and 'The Abuse of Maternity, through its Rejection and through its Unwise Acceptance,' by an anonymous writer.——'A Standard Temperance Prize Essay' is in request by the National Temperance Society of this city. It is to be in three parts, and prizes are now about to be awarded to competitors for the first, viz.: "The Scientific; embracing the Chemical, Physiological, and Medical aspects." The other two parts are "The Historical, Statistical, Economical, and Political," and "The Social, Educational, and Religious." For the best essay under each of these two heads $500 will be paid, and $300 for the second-best. The offer remains open till July 1, 1876. Further information may be had of Mr. A. M. Powell, 58 Reade Street.——B. Westermann & Co., 524 Broadway, announce that they are the American agents for a new English periodical, *Hallberger's Illustrated Magazine*, to be issued shortly in Stuttgart by the publishers of the popular illustrated German weekly, *Ueber Land und Meer*. It will be edited by the poet Freiligrath, and will appear every three weeks.

—A committee of the Boston City Council has, in answer to a petition, been examining the state of the city's records of births, deaths, and marriages previous to the year 1849. Their conclusion is that from 1630, the date of settlement, to the date just mentioned, "not more than seven per cent. of the births are preserved, about the same percentage of the deaths, and probably about two-thirds of the marriages." The deficiencies in regard to the births occur mainly in the century 1744–1849; the unrecorded deaths, owing to the increase of population, mostly took place during the eighteenth century. The committee then point out the sources from which these lacunæ may be filled. The church records are of course the most important. Although these relate chiefly to church members and their families, "this class during the last two centuries embraced by far the greater part of our (Boston) citizens." The custom of infant baptism gives an especial value to this branch of the records, it being possible to obtain from them "the births of a great number of children with an accuracy of date sufficient for all purposes. In fact," continues the report, "it is to be remembered that in England nothing but baptisms are recorded, and the system of town records of births, like the system of registering deeds, was practically employed in New England as a new plan." Besides making copies of the oldest church records, the inscriptions on the tombstones in the three old graveyards in the city deserve to be carefully collated (they have already been published) and revised; and newspapers (for marriages and deaths), deeds, family records, printed directories, etc., will also repay research and contribute something to the collection of facts. This task is recommended to be entrusted to an unpaid commission of gentlemen skilled in such matters. We are not informed of the action of the Council.

—An esteemed correspondent writes us from Washington: "In noticing Mr. Justice Bradley's proposed arrangement of the calendar, you did not explain the manner in which, by his plan, the year would be divided into four quarters of three months each, exactly corresponding with the four natural divisions of the year made by the sun's arrival at the two equinoxes

and two solstices. Thus, beginning at the winter solstice, when the sun is at the extreme southerly point reached by him, where he commences his return to the north, Judge Bradley would place the new year, or January 1, on the present 21st day of December. Then, giving to January, February, and March each thirty days, the 1st of April, or beginning of the second quarter, will, in common years, fall on the 21st of March, and in leap-years on the 20th of March, or exactly at the vernal equinox, when the sun is on the equinoctial line and the days and nights are equal. Then, giving to the next six months each thirty-one days, the 1st of July, or beginning of the third quarter, will fall in common years on the present 22d of June, and in leap-years on the 21st, which is the summer solstice, when the sun is at his farthest point north and the days are longest; and the 1st of October, or beginning of the fourth quarter, will fall in common years on the 23d of September, and in leap-years on the 22d, which is the autumnal equinox, when the sun recrosses the line and the days and nights are equal again. Then, giving to October and November each thirty days, and to December twenty-nine in common years, and thirty in leap-years, the 1st of January will again fall on the present 21st of December in all cases. This allotment of days to each month is easy to remember, is as convenient as any, and makes them correspond to the great natural phenomena of the sun's annual circuit. It is a lesson in astronomy in itself, and is generally approved as the best plan that has been proposed. The placing of the intercalary day of leap-year at the end of the year would be a great advantage in all astronomical calculations and arrangements of the calendar. And the conformity of the entire civil year to the natural year would of course be an advantage amply sufficient to compensate for any temporary inconvenience arising from the change. No alteration in the recurrence of leap-years from the arrangement of the Gregorian calendar is proposed. That is sufficiently accurate for many centuries to come. The law prepared by Judge Bradley to effect the proposed change, and which was read to the National Academy of Science, is extremely simple and comprehensive, and would obviate all inconveniences of a business character that could possibly arise."

—*Lippincott's* for May is in point of interest an improvement on its predecessor, though we cannot say that there is anything in it which one need regret having missed. The opening paper (one of two), called "Up the Parana and in Paraguay," has attractive illustrations and a disappointing text. We are led to expect a well-garnished tale of personal adventure, and presently discover that we are reading a guide-bookish condensation of a matter-of-fact narrative from the French. A really clever translation from that language is made by Mr. T. S. Perry, who selects an amusing trifle by Gustave Droz, "Behind their Fans." There is an interesting account, full of anecdotes, of the French actor Frédéric Lemaître, by Wirt Sikes; and interesting may be called Mr. Vincent's "Northward to High Asia," though it shares the limitations and defects of his 'Land of the White Elephant.' It is not every one, for example, who is favored with a sunrise view of the second highest mountain on the globe, nor every one who is capable of painting the scene or expressing fitly the emotions excited by it. "A Story of American Chivalry" is worth reading for the moral of it, but its literary merit is not high. The number of serial articles in *Harper's* gives it a familiar appearance from month to month. We should as soon think of reading Castelar's seventeenth paper on "The Republican Movement in Europe" as the Hon. S. S. Cox's second and final paper on "American Humor." But Professor Rau on the "Stone Age in Europe," and Professor Brewer on "Agricultural Progress" in the instructive and timely series called "The First Century of the Republic," will well repay perusal. The latter is naturally the fresher and more original of the two, but both are clear and popular in style, and exactly in the line of this magazine. Mr. Parton's account of caricature deals this time with the Puritan period, and is curiously illustrated from old prints. Chief of the illustrated articles, however, is Mr. Frederic Hudson's ample story of the Concord fight, with its maps, plans, and pictures of the locality, and autographic facsimiles of Emerson's matchless hymn and of Longfellow's "Midnight Ride of Paul Revere." In his Easy Chair the editor celebrates the twenty-fifth anniversary of *Harper's*, its 300th number, and 50th volume, and justly remarks that if in this long period its general character has not been essentially changed, "it is because the original conception of what a magazine in America should be was so felicitous and accurate." The even editing of *Harper's* has been, perhaps, hardly less remarkable. Of no other of our monthlies is extended criticism so unnecessary, or brief mention so little to be construed as a slight—so much, as a compliment.

—In the *Contemporary* for April, Prof. W. D. Whitney has replied to Prof. Müller's attack upon him (noticed in the *Nation*, No. 504). He separates the confused mass of current linguistic theories into two groups, the positive and the metaphysical: the latter starting with grand views of humanity and language and proceeding deductively to its conclusions—the former starting from the audible signs and proceeding inductively to their laws. The first is the critical, the second the imaginative school. Prof. Whitney is of the first; but he admits that the second, to which Müller belongs, is at present the more influential among philologists. According to Prof. Whitney, language is altogether conventional. We call a thing a *book* because other people do, and we can so best convey what we mean; and not because the word is akin to *beech*, and our rude ancestors cut their runes on beechen staves. When we want a word for a new conception, we take a word that we have used with something connected with it. As language grows now, so it always grew; and we are not to fancy that the savage foresaw in his instrument of communication the indispensable means of his mental growth Language is a body of usages gradually worked out in the strife of the race with its surroundings. It is an institution. It had its origin when sign-making by instinct became sign-making by intelligence. The dog which barks to be let in and then quietly waits our coming, has taken that step; he has some feeble general ideas, but he lacks the capacity to improve. Prof. Müller's personal criticisms Prof. Whitney answers with studied calmness. The charge of abusiveness he of course denies; and he easily shows the weakness of the attack upon him. One instance only we can give. Prof. Müller quotes him as making the startling assertion that "language is almost as little the work of man as is the form of his skull," omitting the modifying clause, "so far as concerns the purposes for which he [the linguist] studies," etc., the whole being part of a statement that "the absence of reflection and conscious interest takes away from the facts of language the subjective character that would otherwise belong to them as products of voluntary action." Garbled extracts such as this are injurious only to the maker.

—By this time we may suppose the semi-annual change of weather consequent on the shifting of the area of greatest cold (from the continent to the sea for the summer, from sea to land for the winter), to have taken place. The approximate date for the summer alternation is May 3, and as evidence that it has taken place in any year the following signs will be found helpful: 1. The sky begins to be often hazy. 2. The temperature never falls below 45°. 3. The temperature is lowest with SE winds, instead of, as during the preceding six months, with NW winds. 4. Rains usually begin with the wind at SW, and clear off with the wind at NE, instead of beginning with wind at SE and clearing off at NW. 5. The regular breeze of clear weather is from ESE, instead of WNW. 6. Snow becomes impossible. 7. Rain comes from the lower clouds, and therefore much more rain falls from the same amount of cloud (so that the intervals of fair weather are longer); whereas, previously, rain fell from higher clouds, and was mostly reabsorbed in the lower strata before reaching the ground. 8. Electric clouds begin to precede storms, and are known by their compact, globular form.

—The Hungarian transit expedition met with a droll mishap, or rather series of mishaps, at Klausenburg. In the first place, the weather was bad, a nasty rain prevailing for days till the night before the transit; then the battery for their chronograph would not work. However, when the day came they managed to get their telescopes in position, their photographic apparatus in order, their heliometer set up, and, with clocks and chronometers clicking and ticking, waited in breathless suspense for the sun to rise. The first contact of Venus and the sun was to be before sunrise, so that only the emersion could be observed. The anxiously-expected sun at last rose, and rose clear. But to their dismay it rose in a very bad place, immediately behind the great tower of the church, and as there was no time to move either instruments or church, the two principal observers were obliged to abandon their observations altogether. All this is recounted, in the gravest scientific language, in the *Astronomische Nachrichten*, apparently without a suspicion of the humor of the situation. "Mr. Nagy, the assistant," says the *Nachrichten*, "who had a portable instrument, clapped it under his arm, went to a place south of the church-tower, and set it up. That instant he saw the limb of the sun and Venus run together." If these worthies should ever go on another scientific expedition, they had better learn the meaning of that expressive verb, *s'orienter*, *sich orientiren*, or "finding out," as Lowell well puts it, "what is *about east*, and acting accordingly." As for poor Mr. Nagy, the assistant, instead of scuttling round with his portable instrument under his arm, he would do well to imitate Professor John Phœnix, A.M., who "set up his instruments permanently," as he says in his 'Official Report on the Central Route,' "in a mule-cart, which was backed into the plane of the true meridian when required for use."

—A French law-professor at Dijon, M. Capmas, has discovered a large number of letters—original, and copies—of Mme. de Sévigné, which will afford the means of correcting and enlarging the best edition of this author's works yet published. Hachette is to have the privilege of bringing them out. A more precise account is now given of a similar discovery made about a year ago, namely, of inedited manuscripts of Bossuet and Mlle. de la Vallière. Bossuet's portion consists of the remainder of works hitherto known only in part, and of letters to Mlle. de la Vallière concerning her conversion. The La Vallière MS. is a work composed at this turning-point of her life, and entitled 'Gémissements.' It is said to be remarkable for elevation of thought and for its charming style. The possessor of these interesting papers is a Colonel Ferrel, who had already had the good fortune to discover at Meaux the tomb of Bossuet. Still another *trouvaille* has been the intimate correspondence of Charles VIII. with Louis II. de la Trémoille, having reference to the campaign of 1488 in Brittany. Three hundred copies of these letters, together with five by Anne of Beaujeu and some other pieces, have been printed in the choicest manner by the present Duc de la Trémoille.

—The Paris *Polybiblion*, reviewing the new Index of the *Revue des Deux Mondes*, states that the name of F. De Lagenevais, to which sixteen articles are ascribed, is the *nom de guerre* of several different writers, some of whom are revealed in Quérard's 'Supercheries littéraires dévoilées,' and that the Major Fridolin, reputed author of fifteen articles in the same periodical, is really M. De Valbezene, formerly French consul at Calcutta Among the forty articles classified as anonymous, and mostly political, there is a little story, 'Madame de Marçay,' which the *Polybiblion* thinks there are good reasons for attributing to Prévost-Paradol.

—Foreign papers record the accidental death (April 4) of Karl Mauch, one of the foremost of the minor African explorers. Mauch went out to Africa in 1864, but lack of means prevented any great expedition at first, and he devoted himself to cartographic studies of the South African (popularly but incorrectly called the Transvaal) Republic. He furnished a very considerable portion of the material with which Jeppy and Merensky prepared their map. Early in 1866 he met the elephant-hunter Hartley, and made two expeditions with him in that and the following year into the Matebele country, which taught him how to travel and resulted in the discovery of two gold-fields. A private expedition which he undertook the next year, whose real field was to be Central Africa, broke down completely on account of the failure of a friend to co-operate as promised. At the end of July, 1871, he began his last and most interesting journey through the country between the Limpopo and the Zambesi, unexplored since the region south of Sena was visited by Galvro da Silva in 1788. Mauch had very much to endure in the way of imprisonment or robbery, and was obliged to spend nine months among the Makalaka. It was during this time, September, 1871, that he discovered the ruins of Zimbabye, with which his name will always be associated. These ruins, about 200 miles west of Sofala, are of stone—a fact of singular significance among nations where only huts and walls of mud are known. Mauch's own view was that he was in the land of Ophir, for he found another gold-field not far away, and heard of strange animal-sacrifices made here at intervals of several years, which bore a remarkable resemblance to those of the Jews. This view has, however, found no favor among the learned. Mauch finally reached Sena in the middle of 1872, and returned to Germany the same year. One cannot but admire the courage of the man, and regret that ample means and proper training (he was self-taught in those branches which are indispensable to a good explorer) were wanting to make him a truly successful traveller. Much of his work has a permanent value, and he has opened a very promising field to future explorers. His own reports of his work appeared in various numbers of Petermann's *Mittheilungen*, 1867-71. A general narrative of his South African experiences and a tolerably full account of his last journey may be found in a recent *Ergänzungsheft*, No. 37, to the *Mittheilungen*. Mauch was born in 1837, in Ludwigsburg. The manner of his death was sad.

—The Kaulfuss'sche Buchhandlung of Liegnitz (Prussia) has undertaken the publication of a unique magazine, *Der Antikritiker, Organ für literarische Vertheidigung* This is to be a refuge for discontented authors whose books have met with adverse criticism, and who cannot get their replies gratuitously published. In other words, the principle of co-operation is to be applied to the printing of replies to the critics. The unpleasant problem of support is ingeniously solved by permitting the writers to pay about four-fifths of the expense of publication, while the public is further allowed to pay fairly for its reading privileges. German authors are so human and so fond of controversy that we should presume there would be no lack of material for the *Antikritiker*, and, in view of the bitterness of German *Federkriege*, intending subscribers are sure of spicy reading; indeed, the preface of the first number suggests that the warmer the replies, the better. As to the permanent value of such a publication we have our decided doubts. A temperately-conducted journal that would present the other side in cases of excessive criticism, or could offer authors a good opportunity to defend themselves, would be a decided gain. The *Antikritiker*, however, seems to have no editorial supervision or plan (except to avoid prosecution under the press law), and the excessive polemic of the first number against Zarncke's *Literarisches Centralblatt* and the *Jenaer Literaturzeitung* certainly proves too much. The intellectual godfather of the undertaking (who, we suspect, plays a more prominent part than the prospectus and title-page intimate) is a Prussian local medical inspector and writer, who has a rather bad reputation, we believe, on account of his literary quarrels—a fact that is not full of promise for the *Antikritiker*.

## MRS. GILBERT'S AUTOBIOGRAPHY.*

WHAT gives its peculiar charm to this book? This question is not easy to answer offhand. Ann and Jane Taylor have a deserved reputation as the poets of the nursery, but the best-known of their productions, such as "Twinkle, twinkle, little star," are the work of the younger sister, and a desire to know something about the lady who has taught child after child to give thanks that he "was not born a little slave to labor in the sun," is scarcely of itself a sufficient inducement to undertake the perusal of two volumes of biographical reminiscences. A history of religious experiences has, it may be admitted, a genuine interest for all who either sympathize with or care to study the religious sentiment. But Mrs. Gilbert's autobiography, though written by a profoundly pious woman, is not an account of religious experiences. The very honesty of her nature made her dread the habit of "keeping" a diary of religious experience. "To me," she writes, "it appears impossible that this should be honestly done. Much that generally enters into it should pass under the eye of God alone, and to the writer and the reader is almost equally injurious." There are passages of the work which give an indirect glimpse of the writer's pain ful anxiety with regard to the spiritual condition of herself and of her friends. But these passages, suggestive of reflection as they are, do not form the staple of the book. It is chiefly a picture of life drawn by a woman at once profoundly impressed with religious beliefs and sentiments, and also interested with a keen interest in outward nature, and endowed with the capacity to observe and note all that passed around her.

The most obvious cause of the favor with which these annals of an uneventful life have been received by a public who have half forgotten the writings of the Misses Taylor of Ongar, is the skill displayed by Mrs. Gilbert in narrating the details of her own life. Her prose writings, and especially her autobiography, give a far higher impression of her power as a writer than the poems on which, to the end of her life, she looked with an amiable and honest complacency, which was gently ruffled when the ignorance of strangers ascribed the whole merit of the well-known songs and hymns to Jane, and forgot that Ann Taylor had also a claim to some share of the reputation gained by the joint labors of the two. Mrs. Gilbert happily belonged to a generation which had not learnt the odious art of "word-painting," and every scene she describes is told in the simplest language, without any attempt to make the details of ordinary life the basis on which to erect a mass of wordy prettinesses. But for the power of sketching truthfully the beauties of the country, the salient features of character, the little humors and traits which give point and vividness, when once they are noticed, to the most ordinary events of daily life, she compares favorably with our best modern writers. Mr. Stribbling, the blacksmith, who looked "so very ugly," and, though stone-deaf, troubled his minister by complaining of him as a "legal preacher," on the ground that he selected Arminian texts; Mr. Hickman, the minister in straitened circumstances, who, when he wished to borrow a few pounds from Isaac Taylor, used to walk into the house and intimate the extent of his needs by the number of fingers he laid on the table; Mr. Watkinson, the wealthy member of the congregation, who walked on wet days, tall and erect, in pattens, protected from the rain by the newly-invented article—an umbrella; Mr. Meeking, the good-natured, fresh-colored baker, of whose hot toast, "thick heaped and sodden with butter," Mrs. Gilbert at the age of sixty retained a grateful recollection—these, and twenty or thirty other portraits, all drawn with the same discriminating humor, stand before the reader in as clearly-marked outline as the characters in 'Cranford' or in the 'Mill on the Floss.'

* 'Autobiography and Other Memorials of Mrs. Gilbert (formerly Ann Taylor). By Josiah Gilbert.' London: Henry S. King & Co.

The description, again, of the childhood of "Nancy and Jenny," of their brothers and sisters, of their mother, and above all of their father, are in their way perfect pictures of home-life. Isaac Taylor the younger (the author of the 'History of Enthusiasm') and Jane and Ann will always be better known than the father and mother from whom they derive all they had of genius and, so far as such a thing can be derived from others, all that was peculiar in their type of goodness. Mrs. Gilbert's autobiography would indeed well deserve all the popularity it has achieved had it no other merit than that of painting the character of her father. Of her father, as of every other person or thing with which she deals, Mrs. Gilbert writes with the utmost simplicity and directness. Her unbounded love and admiration for him do not lead her into the folly of heaping eulogy on virtues and talents which speak clearly enough for themselves, yet students who carefully observe the traits by which Isaac Taylor, the engraver and minister, is revealed indirectly in his daughter's pages, for the instruction and admiration of all who can appreciate goodness and originality, cannot but feel as though they were reading of a character of romance painted by a skilful novelist. Caleb Garth, David Elginbrod, above all the minister in 'Cousin Phyllis' (the most graceful of all Mrs. Gaskell's tales), have each something in common with Isaac Taylor. You seem to see in him the reality of which the fancied pictures are the shadow. And when this is perceived, the question wherein does the charm of Mrs. Gilbert's autobiography consist, is more than half answered. To paint home-life is a rare talent, but the picture painted is of no worth unless the home-life be worth recording. And what gives the interest to the autobiography is that Mrs. Gilbert not only describes, with rare fidelity, country life in England as it existed more than sixty years ago, but also paints a family in each of whom there existed in combination qualities which are not only admirable in themselves, but are in fact rarely found in complete union.

The character of Isaac Taylor the elder was inherited in different degrees by his children, and, together with the almost equally remarkable character of Mrs. Taylor, gave the tone to the whole household. Mrs. Gilbert thus writes of her father: "At thirteen he commenced a life which became one of diffusive piety. At sixteen he joined the church under the Rev. Mr. Webb of Fetter Lane, and from these early years till he went down to the grave at seventy-one, his character was one beautiful progress through the benignant graces of Christianity. His love of knowledge was early strong and universal; nothing was uninteresting to him that he had opportunity to acquire, and when acquired his delight was to communicate. Apt to teach he certainly was. All his methods were self-devised, and the life of few men devoted to teaching as a profession would have accomplished more than he attained by husbanding the half-hours of his own." The noticeable point in these sentences is that they point to a union which is rare of fervent piety with what may be termed the scientific and inventive cast of mind. Moreover, in Isaac Taylor and in his descendants these characteristics were not combined only, but really fused together. No reader of religious biographies can fail to have observed that there are cases in which religious interests seem to have absorbed all the energies of a man's soul, and to have rendered him indifferent to speculations or investigations which do not directly belong to the sphere of religion; and observation of life itself is sufficient to show that in the minds of many persons, whose genuine religious feelings and belief it would be folly to doubt, there exists a division between their religious and secular interests. In either case the character suffers. In the first it is dwarfed, or stunted, on one side. In the other it lacks the sincerity and simplicity which can hardly coexist with a divided mind. The special beauty of Isaac Taylor and of his children is the perfect sincerity and simplicity which arise from the harmonious development of the whole of the intellectual and spiritual nature. Thus he continued through life both an engraver and a minister, though, if we understand Mrs. Gilbert rightly, towards the latter part of his life he was almost wholly devoted to ministerial duties. But there never appears to have been in his own judgment or in that of any of his children the least incongruity between the practice of his trade and his work as a minister. In each case he did with all his power the duty set before him, and would, we may conjecture, have been at once amused and indignant at the views of any man who had told him that the performance of the one duty was in any sense inconsistent with the performance of the other. It is easy to conjecture the sort of reply which he would have made, from the answer which he in fact gave to certain members of his congregation who objected that he did not confine himself to preaching what they were pleased to consider the "Gospel."

The piety, intellectual energy, and perfect simplicity of Mr. Taylor's character are remarkable enough in themselves. But they deserve special attention on the part of a critic of Mrs. Gilbert's autobiography, because the same qualities form the basis of her character. Intellectually, she was, it may be suspected, considerably her father's inferior. He possessed a breadth and calmness of mind which certainly were wanting in his daughter. She apparently inherited from her mother an anxious conscientiousness, which must, as appears from one or two traits, have caused her bitter suffering throughout life. Her fearful and lasting anxiety as to the final condition of a child who died when young; her candid statement of the fact that, except for one short period, she had never been able to find the religious peace for which she constantly sought, point to a gloomy side of her character and to features in her religious creed which, were this the place for theological discussion, ought to receive careful consideration. But her intensely strong feelings, both of affection and of pleasure, her love of work, her delight in all the life around her, her perfect honesty of purpose and of intellect, are the reproduction of her father's best qualities. This honesty, in fact, is the salient trait both of her moral character and of her literary work. It is hard now to realize, even in imagination, the time when 'Cœlebs' was the "book of the day," and Hannah More an authority whose doctrine was almost above question. It is, however, characteristic of Mrs. Gilbert that she should, when young, have criticised a manifest inconsistency in Mrs. More's 'Christian Morals' with a freedom and directness which made the "distinguished authoress" express "her displeasure in a manner unworthy of her genius." It is characteristic of the same honesty and simplicity that throughout the whole of her autobiography Mrs. Gilbert never for a moment divides her religious reflections from the course of her narrative. Religion and life are with her, as with her father, far too closely blended to be in any way separated as belonging to different spheres of thought. Her account, for example, of the Forbeses runs into a discussion on special providences, which is immediately followed by an account of the way in which "Jane and I began the arduous experiments of making our own dresses." Her honesty and insight are the qualities that have enabled her to produce an autobiography which, combined with the memorials admirably put together by her son, constitutes the best picture we have ever seen of the fair and noble side of English Dissent. The Nonconformists have received hard measure from the English public. It is well that the coarse caricatures, such as Chadband, and the Shepherd, or the hard satire of 'The Chronicles of Carlingford,' should be met by the truthful portraits of Mr. Taylor of Ongar and of his daughters.

## THOMPSON'S NATIONAL ECONOMY.*

PROFESSOR THOMPSON belongs to what is best known as the Philadelphia school of political economy, a school of which Mr. H. C. Carey is the acknowledged head, and most of the literature of which, so far as we know, emanates from that gentleman's native city. The term "National system," first used by List, is, however, adopted in the work now before us, as also the very objectionable one of "American and German school." If the application of the latter term has any other object than that of deceiving the youthful reader into the belief that the doctrines of this school are generally received in Germany, we should like to know it.

The first question which arises on examining a work of this school is whether the author can give us any clear, concise, and definite statement of his principles which shall show the relation of these principles to the facts of life. An inability to do this seems to be the general characteristic of Mr. Carey and his followers. They state facts in sufficient number, and explain their opinions at great length; but the connection between the facts and opinions is always left in a very shadowy state, and the subject is generally discussed more in the spirit of the partisan than in that of the philosopher. We are glad to see that in the general tone of the work Mr. Thompson is an improvement on his predecessors. His righteous indignation against the opposing school is not such as to prevent his discussing the subject with a show of calmness through at least the first half of the work. He gives a critical description of the methods of the various schools of the science, which, though entirely inadequate, is obviously meant to be fair and unprejudiced, and affords a crumb of satisfaction to the critic who has been vainly searching through the volumes of Mr. Carey to find a gleam of impartiality or good-sense. The school formed by Adam Smith, whose methods are now followed by the leading writers of all civilized countries, he calls the Cosmopolitan school, and he objects to it that it practically ignores the division of mankind into nations. From a protectionist point of view this is the fact, and the answer that would be made to the objection by the school is that, as applied to the particular question in the mind of the objector—namely, that of protection or free-trade—the division of mankind

* 'Social Science and National Economy. By Robt. Ellis Thompson, M.A., Professor of Social Science in the University of Pennsylvania.' Philadelphia: Porter & Coates.

into nations is, from a purely economic point of view, non-essential. The position of the parties is similar to that of two neighbors, one of whom refuses to buy of the grocer who has the best and cheapest supply of goods from purely personal objections to him. The other, arguing that the grocer who sells the cheapest is the most profitable to deal with, is told that he ignores the facts that the man has red hair and beats his wife.

The most encouraging paragraph of all is on page 31, where a faint conception of the real difference between the Philadelphia and the Cosmopolitan schools is clearly indicated. Instead of the deductive method of the mathematical sciences adopted by the English school, he would "apply the inductive method of observation and generalization, which has produced such brilliant results in the natural sciences." Now, when we clear away the great mass of vague assertion with which the writings of the Philadelphia school are loaded, we find that the last sentence expresses with sufficient accuracy what is peculiar in the method which it adopts. Progress in the natural sciences consists in the discovery of certain laws, in blind obedience to which all natural events occur. When we say blind, we mean that the events occur without regard to consequences. If a barrel of powder is touched by a spark, it explodes as instantly and as certainly in the midst of a Sunday-school as on the open plain. If the whole human race were so situated as to be destroyed by the explosion, that fact would not delay it a moment. Were the acts of mankind governed by laws of this same nature, we should certainly have to apply the methods of the physical sciences in order to investigate them with success. Political economy, being concerned in investigating the consequences and the laws of human action, would then have to be pursued by the same methods. But every one knows that human acts are not, either individually or in the mass, governed by any such laws. There are no natural laws under which a steamship must leave port on a certain day, and be loaded with certain goods; a railway be built between certain points; a city arise in a certain region, or goods be imported from certain markets. The steamship leaves one port in order to reach another, and, to prevent her from leaving, a simple despatch that the first port was destroyed would be sufficient. A factory arises in a city, not in blind obedience to a law, but because the builders, after careful calculation, see a prospect of improving their condition by means of it. Hence any system which regards industrial phenomena, such as the rise of factories, the improvement of agriculture, and the extension of trade, as results of laws similar to those under which powder explodes and trees grow, can lead to nothing but confusion.

That which distinguishes the school of Adam Smith from the one now under consideration is not the doctrines which it teaches, but the recognition of the difference we have sought to elucidate. Its writers disagree on many minor points, but agree in considering man as a being able to take care of himself, and desirous of making a living, and of getting rich if he can, while all industrial phenomena are viewed as results of this propensity. He cultivates the ground, not because it is a natural law that the ground must be cultivated, but in order to secure a supply of food. They consider him also as a being of sufficient shrewdness to adopt the best attainable method of securing food, clothing, and home comforts. If, instead of making his coat at his own home, he sends across the ocean to a foreign pauper for it, it is because he finds that, after paying all expenses, he gets it cheaper than by making it himself. If the foreign capitalist sells him the coat at less than cost, for the purpose of destroying his factory, and of inundating him with cheap clothing, he will buy as long as the capitalist plays such a losing game, and when that unwise enemy puts up the price he will cease to buy, and, having a year's supply of clothing on hand, he will start his own factory going again.

A very good illustration of the difference between the two schools is afforded by Mr. Carey's favorite law of the occupation of the earth, to which Mr. Thompson devotes an entire chapter. This law is that poor soils are always cultivated first, and that agriculture always spreads to richer ones. A follower of Smith, even if he admitted the facts, would deny the existence of any such law. He would allege that the first settlers would always choose the richest soil which they were able to cultivate, and if, in any particular case, this should happen to be the poorest one, it would be simply because there was some material obstacle to the cultivation of the others. This would reduce the question to the purely physical one whether, as a matter of fact, soils are everywhere difficult to reclaim and cultivate in exact proportion to their fertility. But, in lieu of considering this question, our author follows Mr. Carey in seeking to trace the movements of population during the prehistoric ages, and professing to know exactly what regions were then most fertile, he declares that they were always the last to be settled. The conclusion is, that by an inexorable law, like that by which water flows downward, whenever a new country is peopled the settlers must begin by cultivating the poorest soil they can find, and gradually pass to that which is more fertile.

In a negative way, the work is a decided improvement on the writings of Mr. Carey. There is less bitterness of feeling, fewer paradoxes, and some respect for notorious facts. But of positive merits there are none. We find the same want of clear and definite statement, the same dreary repetition of vague and meaningless generalities, the same propensity to judge everything by the one shibboleth of protection, and the same absence of any consistent system of views on questions of currency, which characterize the writings of his predecessors. Much of the chapter on currency is written, unintentionally perhaps, on the Talleyrandian principle, under a supposed necessity for saying something. What shall we say to an author who complains of our national banking system that under it

"A vast amount of money is paid in transactions between distant parts of the nation by the cumbersome and expensive method of drawing and negotiating bills of exchange. The sales of the Western crops and the purchase of Eastern goods in exchange is [*sic*] actually carried on as if it were a transaction between the merchants of two different nations, and sometimes at an expense of several per cent. premium or discount to business men"?

Apart from all questions of governmental policy, which do not constitute an integral part of political economy as a science, the spectacle of a class of students in a university being fed with such mental food as this is by no means a cheering one. It seems impossible to find a writer who, while in favor of protection, or at least not an advocate of free-trade, shall still be able to give a fair and clear account of the method of reasoning in social science, and of how causes operate in the business world.

---

*The Romance of the Association;* or, One Last Glimpse of Charlotte Temple and Eliza Wharton. A curiosity of literature and life. By Mrs. Dall. (Cambridge: J. Wilson & Son. 1875. Sm. 8vo, pp. 102.)—Mrs. Dall came into possession of some dozen or more letters written by Elizabeth Whitman, and decided wisely that they would interest many who had heard of the heroine of a New England tragedy of the last century. Miss Whitman was a belle of Hartford a hundred years ago, the daughter of Rev. Elnathan W. and Abigail (Stanley) his wife. In 1778, Elizabeth started for Boston, ostensibly to visit friends, but never arrived there; later it was found that she had died in Danvers, having given birth to a dead child. Scandal was triumphant, as she had never confessed a marriage, though to her newly-formed friends at Danvers the unknown always asserted that she was a wife. A Mrs. Forster, of Watertown, wrought the facts and fancies into a novel, which had a great vogue, called 'Eliza Wharton; or, The Coquette.' As Miss Whitman had been betrothed to Rev. Joseph Buckminster, and as Pierrepont Edwards was pointed at as the father of the child, the story spread like wildfire.

Not only did Mrs. Dall obtain the letters, but she witnessed the reunion of one of the family with a long-parted friend, which happened by chance at a meeting of the American Association at Hartford in 1874. The happy meeting was doubtless very pleasant to the persons interested, but it is made the occasion by Mrs. Dall of a needless amount of gush. The letters are not very important, but their publication was a sensible idea. What we have to complain of, however, is her taking occasion to turn the matter into a long and rambling discussion of her own thoughts and feelings. Besides this, we have to complain seriously of Mrs. Dall's attempts to falsify the history of families. Eliza Whitman's maternal grandfather was Colonel Nathaniel Stanley, Treasurer of the Colony. He was descended from a Thomas Stanley, who came here with a brother Timothy; a third brother, John, dying on the passage. Another of his descendants was Charlotte Stanley, who was seduced in 1774 by an officer in the British army, and who was the heroine of a novel called 'Charlotte Temple.' At least we say that she was of this family on the authority of Mrs. Dall, who writes that "Charlotte was a near cousin of the mother of Eliza" Whitman. Mrs. Dall strives to impress her readers with the idea that these Connecticut Stanleys were of the family of the Earl of Derby. She calls the two ladies, Charlotte and Elizabeth, "women of the Stanley blood, descendants of the Great Earl, King of Man, and Charlotte de la Tremouille." Here we touch a definite statement; but James, seventh Earl of Derby, who married Charlotte de la Tremouille, was born in 1606 and was beheaded in 1651. Now, Thomas Stanley of Hartford is considered by Savage to be the emigrant who came over in the *Planter* in 1635, aged sixteen. Hence he was born in 1619, and could hardly be the son of the Earl, who was but thirteen years his senior. Even in profligate England, peers are rarely fathers at the age of thirteen. The eighth Earl, Charles, son of James, was born in 1627, and his two sons succeeded in turn; then, in 1736, the title went to a far-

away cousin, descended from the first Earl. What a pity it was not known that no less than three sons of the seventh Earl had emigrated to America and had left issue! Again, Mrs. Dall weaves some incomprehensible fancy about the Harts of Hartford as connections of Shakspere, and Thomas Stanley, of Tonge Castle in Shropshire, second son of the third Earl of Derby, and Thomas Stanley of Hartford. This is above our intelligence. Next she writes that soon after "Thomas Stanley was laid to rest, a daughter of William Harris married William Pierrepont, last Duke of Kingston," from whom sprang Sarah Pierrepont, wife of Jonathan Edwards, mother of Pierrepont Edwards. Now, the last Duke of Kingston was *Evelyn* Pierrepont, who married the notorious Miss Chudleigh, and died without issue in 1773, when his sister's son inherited his property. There was never a William Pierrepont, Duke of Kingston, and of the Earls of Kingston none married a Harris. What Mrs. Dall has in her mind is possibly an unfounded claim of the American Pierponts to belong to some branch of the English ducal family.

But it is hard to reason with a genealogist who writes:

"If a Puritan son came to New England with his family, the angry Cavalier left his name standing on the household book awhile. If the same man returned in 1640 (!) to take part with Oliver Cromwell, the unhappy father wrote against the name 'dead *sine prole*,' and this fact, not always capable of proof, when encountered at the Herald's office, is one great obstacle to establishing an American pedigree."

We do not well know what to call this story; it is at least absurd. If any American refuses to accept official records as a bar to a theoretical pedigree, he or she is not of the fraternity of genealogists. Mrs. Dall has offended in this way before. Three years ago she wrote to the journals that her ancestor, Thomas Wells, owned and founded the town of Wells, in Maine. The historian of the place, the late E. E. Bourne, showed conclusively that this was altogether wrong. In still later writings she has put forth other mistaken pedigrees. The object of her present book was a good one, but while we can pardon her rhapsodies about Eliza Wharton, we cannot tolerate this false claim of a noble pedigree for a quiet and well-behaved New England family. Another generation may accept it for truth.

---

*What Young People should Know.* The Reproductive Function in Man and the Lower Animals. By Burt G. Wilder. "Honi soit qui mal y pense." (Boston: Estes & Lauriat.)—"The complete title of this little work," says Prof. Wilder in his preface, "should be 'Some of the Things Young People should Know.'" But, to be exactly descriptive, the title must undergo still further emendation, so as to read, 'Some of the Things *Some* Young People should Know.' We insist upon this limitation, not because the author has offended against propriety or common prudence (as we suppose) in any respect, but because the physiological exposition, which occupies three-quarters of the text, is so technical in its method and its terminology as to resemble and really to constitute a lecture to medical students. They alone are capable of feeling an interest in or of understanding all the points of the discussion, which contains so much that is not merely unnecessary, but almost pedantic, that of medical students alone can it be fairly said that they "should know" anything about it. But to this class there is certainly no need of apologizing for treating a subject which is universally tabooed in common-school text-books, and the motto "honi soit" appears to be quite gratuitous. We have taken an indirect way of saying that Prof. Wilder has failed to popularize the instruction he wishes to convey, and one cannot help thinking how much better his master, Prof. Wyman, would have succeeded in this task—if it were possible to conceive of his undertaking it—when one suddenly comes upon a tribute to him (p. 52) which has no earthly connection with the chapter in which it is interpolated as a foot-note. On the other hand, fancy that great teacher saying, in a treatise like this, of a certain function: "No satisfactory explanation has, as yet, been offered. Certain facts in Comparative Anatomy and Physiology have led me to entertain a new view of its purpose, but I am not yet ready to publish it." This sounds a little odd, both from the intrusion of the author's personality and on other accounts. But it is not so queer an illustration of his regard for the doctrine of final causes as the passage on p. 42, where we read, of the arrangement of certain organs, that it "is offensive and apparently uncalled for. . . . We must conclude, however, that some deep significance attaches to this association," etc., etc.

In the second or ethical portion of the work there is much less to take exception to, and much to commend, though it is not entirely to our mind. Some things not in it we would have said, and some things in it we would have left unsaid. But the author's earnestness and purity of motive are here made so manifest as to disarm any criticism stronger than an expression of disappointment. That feeling we can but have for the book as a whole, believing that its usefulness is greatly restricted, and that the author's intention to gain the ear of all "young unmarried persons of both sexes" will not be realized. Medical students, as we have said, and parents, at least for their children's sake, may find instruction and profit in it.

---

*The Land of the Czar.* By O. W. Wahl. (London: Chapman & Hall; New York: Scribner, Welford & Armstrong.)—This is a stout octavo volume of 400 pages, replete with information about Russia, and very convenient for reference. An account of the various peoples embraced in the Empire occupies more than half of the work. This is followed by a summary review of Russian history down to the present reign; and chapters on the church, and on the languages and literature of the country, fill out the scheme of the author. Herr Wahl is an apologist for Russia, but evidently a simple-minded and not a paid defender. The moderation of his judgment of her rulers and her policy is unmistakable naïveté, and not vulgar whitewash. This makes his historical narrative amusing when otherwise it would be hopelessly dry and unattractive. Much more readable are the earlier and the later portions of the book, especially the survey of Russian literature, which, if it does not inspire us with a very high respect for the author's critical ability, lays us under no little obligation to him for the information which it contains.

What most mars the usefulness of this compendium, apart from the want of method pervading the whole, is the faulty idiom in which it is composed, and the un-English and unscientific spelling of Russian proper names. The idiom is occasionally too bad to excuse even in the proof-reader, let alone the publishers. Ungrammatical sentences, too, like this (p. 333): "The great guide to a just appreciation of the intellectual life of nations *are* their languages and literature," are much too common; and once in a while one meets with an extraordinary effort like the following: "The Russian Monarchy of our days, into the colossal proportions of which the preceding chapters have given the reader some insight—if now it extends over 500,000 square miles—in the year 1462, it possessed but 18,500." The punctuation is frequently, as in the instance just cited, discreditable to everybody but the author. His spelling is by turns German, French, English, and Russian, the German forms naturally predominating; and the inconsistency is of course very great. The great Tartar chief, whose multiform name is perhaps most familiar to English eyes as Genghis Khan, appears here on page 270 and generally as *Tchinggis-Khan*, in the index without the hyphen, and on page 358 as *Tshinggiskhan*. This spelling is as distinctly German as the Gotha geographers' *Udschidschi* for Livingstone's Ujiji. The Russian general whom English usage calls Suwarow, Herr Wahl or his translator calls *Souvarov*, a better spelling than the former in some respects, but mongrel at best, and having the fault of ending in *v*, instead of in *f* or *ff*, which the best usage now reserves for proper names of persons. The opposite fault is exhibited in *Kieff* (page 355). For the familiar Janissaries we have *Yanitshars; Vallachia* for Wallachia; on the same page (266) *Y*aroslav and *J*aroslav; on page 300, *Dnepr*, on page 306, *Njémen*. Forms like *Mithridat* for Mithridates, and *Kreml* for Kremlin may also be pointed out, and finally, not to multiply examples, for *Donski* Cossacks (page 289), and *Kubanski* Tartars (page 290), the English idiom would have been content with Don Cossacks, etc.

---

*Un Vaincu.* Souvenirs du Général Robert Lee. Par Mme. B. Boissonnas. (Paris: Hetzel et Cie.; New York: F. W. Christern.)—It would not be easy to name a book more cordially to be commended to those who desire a general knowledge of our war than this one. To those who like biography, and who are fond of reading French, it presents especial attractions. It is most agreeably written, and its convenient size, good paper, and clear print make it welcome to the hand and eye. It is gracefully dedicated to the sons of the authoress. She says to them: "J'aime les braves gens, je crois qu'il y a toujours à gagner en la compagnie des nobles âmes," but she tells them frankly that "her hero" fought for the South—"la terre de l'esclavage"; and adds, on a later page, "Parce que sa croyance était sincère, parce que son erreur était loyale, nous osons, sans cacher nos regrets, réclamer pour lui le profond respect de tous les gens de cœur." It is touching and striking to find the following sentiment expressed by a woman of the vanquished French race: "Il avait un de ces caractères rares chez tous les peuples, et que notre pays devra produire s'il se soucie de recouvrer sa force: une de ces natures où la fermeté n'a pas besoin d'illusions."

The book is a biography of General Lee from his birth to his death, but two-thirds of it are devoted to the war of Secession and to the part

which he played in it. It is a very good account of the operations of the Army of the Potomac and of the Army of Northern Virginia, and a surprisingly good one to have been written by a foreigner and a woman; for, with all women's gifts of composition, their nature and their education do not qualify them for the composition of military books. It has many inaccuracies, but that is natural, and we will not dwell upon them further than to warn the uninstructed reader not to accept the repeated statement that Grant and Meade commanded distinct armies in the Virginia campaign of 1864–5, and to say that Gen. Hooker, though disgracefully beaten at Chancellorsville, carried off many scores more than "un seul canon" when he crossed the Rappahannock in retreat. We have read 'Un Vaincu' with interest and pleasure, and we hope that many readers of the *Nation* will see for themselves whether they are not rewarded for the purchase of it.

---

*De Laudibus Legum Angliæ.* By Chancellor Sir John Fortescue. With notes by Andrew Amos, and life by Lord Clermont. (Cincinnati: Robert Clarke & Co.)—This is a publication which we have too long delayed noticing. The house of Robert Clarke & Co. have published a number of legal classics from time to time, and laid not only the profession of the law but the public under obligations to them for the excellent manner in which the work has been done. Fortescue's treatise was selected as the third of their series, and Amos's edition of 1825 was chosen for republication. The publishers, fortunately before it was too late, heard of Lord Clermont's privately printed edition of Fortescue's life and works, and through him obtained a copy for use in the preparation of the book for the press. The Cincinnati edition therefore contains Lord Clermont's "carefully corrected revision of both text and translation," Amos's notes, and Lord Clermont's life. The book itself is so well known that little need be said of it. It is one of those classics which every lawyer is supposed to read, though few can with truth say that they have accomplished this task, and their very stings of conscience make them desire to possess it. Fortescue was Chief-Justice and Chancellor to Henry the Sixth, and his life belongs to the stormy period of the fifteenth century, his fidelity and devotion to the Lancastrian party lasting till the battle of Tewkesbury and the murder of Henry and the death of his son placed Edward the Fourth in possession of the kingdom. When Fortescue was taken prisoner, Edward pardoned him and restored his estates, on the humiliating condition that he should recant or rather refute his own arguments proving the right of the House of Lancaster to the throne. Intellectually, this was not very difficult to do, for the arguments on either side were of a very general and inconclusive kind, drawn mainly from the Scriptures. He had previously proved that Edward had no right to the throne as claiming it through the female line, and, inasmuch as the Bible and the Fathers were unanimous upon the point that man was ordained to be above woman, it seemed clear enough that Edward had no title; but he now discovered his mistake, and saw that such passages as that in Genesis, "thou shalt be under the power of man, and he shall be thy lord," were capable of an explanation in no way conflicting with Edward's title, for it meant, not that a woman should be under the power of all men, or of many men, but that she should be under the power of some man; "and that every woman is under the power and lordship of some one man . . . may not be denied, for every woman is under the power and lordship of the Pope, which is a man and the Vicar of Christ, God and man." It must not be supposed from this, however, that Sir John Fortescue was a sycophant or a time-server, for he had given, in exile and suffering on behalf of his old master, many proofs to the contrary. But he felt, probably, that the struggle was over, and that it was not the part of a wise man to protract it further. The treatise 'De Laudibus' was composed by Fortescue, when in exile, for the benefit of the young prince, Henry's son, and takes the form of a dialogue between the two, in which the old Chief-Justice sets forth to the young man the glories of the common law, explains to him the differences between it and the civil law, and, it is needless to add, effectually convinces his pupil of the inferiority of the latter. No good lawyer would teach law now in this way; indeed, many a page of Fortescue might be taken as an excellent example of the way not to teach law. Nevertheless, and partly on that very account, the book is the more interesting and, as a classic, valuable.

## The Week.

THE Alabama Legislature has been engaged in investigating the election to the United States Senate of Mr. George E. Spencer, who, it will be remembered, was re-elected last autumn. Spencer, it seems, feeling convinced that there were serious dangers threatening the negro and the Union man throughout the South, went to General Terry and urged him to send troops into the State, which was done. The election took place, but unfortunately there was every reason to suppose that the majority of the Legislature was Democratic. Nevertheless, Mr. Spencer, being a man of energy and perseverance, determined not to let this stand in his way, and proceeded to take measures looking to the organization of two legislative bodies, one in the Court-Room and the other in the Capitol. The Court-Room branch of the Government he took charge of himself, and as the number of members together was hardly large enough to be imposing, or to have a good moral effect, he went to work to increase it. This he found a simple task, not being obliged to go through with the formalities of an election; he merely found it necessary to hire a number of gentlemen to come and "represent counties," and in this way he soon got together a quorum. The only remaining obstacle in the way of a triumphant election was the possibility that the Capitol Legislature might have a quorum too, and proceed to the election of a Democrat. To prevent this, one of the members of the Capitol Legislature was bribed to stay away, and another was drugged and made insensible. The campaign as a whole would have required a good deal of money, but as the money used by Mr. Spencer came from the Post-office and the Internal Revenue offices, it cost him nothing. Spencer was elected, but afterwards the existence of two legislatures was referred to Washington, and a compromise was proposed by the Attorney-General. It was found, however, that unless a Democratic senator could be unseated and a Republican put in his place, the "record" would show Spencer's election to be void for want of a quorum, notwithstanding all the trouble he had taken to get one. The payment of a few hundred dollars settled this difficulty, however, and the whole thing seemed as nicely arranged as possible.

Unfortunately, the evidence brought out by the investigation seems to render it unlikely that Mr. Spencer will be able to retain his seat in the Senate. The "Assistant-secretary of the Republican State Executive Committee" produced a letter of Spencer's in which he directs the use of the troops in "making arrests" in three counties, but adds that he does not wish his name mentioned in the matter. Another witness, a Republican member of the Legislature, gave some interesting information on the subject of outrages and intimidation. He and others, he says, made a requisition for troops before the election, it being understood that they were to be placed at the disposal of "Mayer and other revenue officers" "wherever intimidation was necessary." These troops were accompanied by United States marshals, provided with fictitious warrants with the names of citizens prominently displayed, and were marched through various counties. Intimidation, however, was rather dull, for some reason, and so the witness, to put a little life into the campaign, shot a hole in his hat, and reported himself as attacked by Ku-klux, and sent troops after the assailants. Altogether, the evidence is very instructive.

At the Detroit meeting of the Social Science Association Mr. Dorman B. Eaton read a paper on Civil-Service Reform, in which he gave the history of the attempt to improve the character of the service, and explained its failure. He lays most of the blame on Congress, but does not think the President can escape responsibility. What he says about the President, however, is so carefully guarded and qualified that the general impression left by the address is that the failure was due rather to the gigantic nature of the task than to his want of fitness for the work. With regard to the earnestness and determination of the President, Mr. Eaton falls into the mistake of imputing to him a strength of interest and conviction which his public acts unfortunately disprove. When we wish to know the intentions of General Grant as to the civil service, to discern whether he is influenced by lofty and unselfish motives and sets himself a high standard, we always proceed in one way: we ask ourselves what kind of appointments he has made. These are the best possible tests of his zeal for reform and of his standards as to character. When we think of Sickles, Casey, Shepherd, to say nothing at all about "nepotism," we are convinced that the President does not begin to know what reform means; and the proof of this is so clear and complete that we cannot be expected to pay much attention to reports about his motives and intentions, which after all come indirectly from himself. As to Congress, it certainly was much to blame; but surely no one who went into the civil-service reform movement ever expected Congressmen to give up their most valuable privilege without a struggle, and indeed the hostility of Congress was one of the things most certainly to be counted on. When the Republicans formally undertook to purify the civil service, the system of appointments prevailing at Washington was not a novelty. It was an old, established abuse, and to complain of the hostility of Congress is almost as strange a thing to do as it would be for the advocates of liquor-law reform to deprecate the hostility of the proprietors of "bucket-shops."

When the members of Congress have all reached that stage of development in which they voluntarily establish competitive examination for all offices at their disposal, as one or two of them do now in the case of West-Point cadetships, there will be no longer any need of a reform movement at all; but at present the greed of the Congressman for power and influence in the distribution of offices is the very thing against which the reform is directed. The President when, after four years' experience, he was renominated, certainly knew this; and for him now, on the ground that Congress is growing more hostile, publicly to wash his hands of it, and treat the matter as one which he might take up or drop at pleasure, is by no means creditable to him. The President as a reformer has managed to earn a very queer reputation, not merely by his civil-service performances, but in other fields as well. Whenever any gigantic frauds are unearthed—like those of the whiskey ring—or when an incompetent officer is removed to make way for a fit person, as in the case of Mr. Douglass, or when the Attorney-General issues a reformatory order with regard to such a matter as applications for pardons, the news is at once telegraphed all over the country that "the President is heartily in favor of the change," the President is "determined to put a stop to these villanies," or that "the President will use every effort to facilitate the officers of the Government in their struggle with the thieves"—producing the impression that though, under ordinary circumstances, his tastes and character lead him to prefer incompetent to competent subordinates, to like villains, particularly those who prey upon the government he has charge of, and to obstruct, when he can, the efforts made to bring them to justice, still, in this particular case, he is willing to make an exception and do his duty.

John C. Breckinridge died on Monday at his home in Lexington. He was the last Vice-President under the old régime, and the beaten

leader of the South in its last constitutional struggle against the anti-slavery sentiment of the North, which three "doughface" Administrations had fully ripened. He was one of the last of the Southern senators to quit Congress and join the open rebellion, and to the last remained in active service as a Confederate general, displaying as much bravery as constancy, and keeping aloof from those personal quarrels which so disfigured the closing scenes of the Confederacy. In his whole career he never excited the animosity which the less temperate and dignified partisans of slavery engendered, and in the case of no one of the leaders of the lost cause is it easier for the Northern public to forget and forgive, or more natural to lament the still early closing of a career which was precocious even for our hot-house politics. Mr. Breckinridge passes away just as what seems like the dying echo of the rebellion comes up to us from Texas, where Jefferson Davis and Gen. Bragg have been reviewing the militia on a grand scale and uttering sentiments of peace and patriotism. The militia were of course chiefly ex-Confederate soldiers, and Mr. Davis reminded them of the fact, but he also told them that they now owed devotion to the flag of their country, and should fight for it when the need came as they had fought for his flag. This talk was received with great favor by all who heard it, and we trust that it has been read everywhere with pleasurable emotions. There are, however, not a few radical spirits who, if Mr. Davis had delivered an "irreconcilable" harangue at Houston, would have cited it as a proof of the irredeemable depravity of the slaveholder, and we fear that they will on *a priori* grounds decide that what he actually did say was sheer hypocrisy, boding no good to the Republic. Such persons are, of course, at this date the real irreconcilables; the times change, and they do not change with them.

---

Governor Tilden's message on municipal government is an able paper, showing great familiarity with the subject, and a determined disposition to reform abuses. Mr. Tilden refers with satisfaction to the passage of the "Public Remedies" bills, suggests the passage of a general act applying to all the cities in the State, and thinks that "additional measures of remedy and restraint" are much needed. The taxpayers ought to be invested, he says, with large powers of association and organization for the enforcement of publicity and for the purpose of local investigation and the institution of suits against delinquent officials. "They might also be endowed with capacity to take and execute contracts for public work, under the supervision of and on the plans fixed by the municipal officers. There is no reason, for instance, why the persons taxable for the improvement of a street should not be allowed to associate and by their own agents execute the work for which they pay." The Governor proposes that a "commission be appointed to report to the next Legislature such laws or constitutional amendments as may be required." The message has been expected for some time, and, coming after the excitement of the canal exposure, has not attracted the attention which the importance of the subject merits. The Assembly has succeeded in passing a Rapid Transit Bill, which has the approval of those who have given the subject most thought; and with the underground railroad to Harlem completed, and an elevated railway on the west side of the city, and the bridge connecting Brooklyn with New York made a public work, it begins to look as if this much-vexed question was gradually disposing of itself.

---

We beg to call the attention of a correspondent, who wrote to us the other day complaining of the severity of our strictures upon the Wisconsin code of legislative ethics, to a paragraph which is now going the rounds of the papers with reference to a loan proposed to a foreign capitalist secured by Wisconsin real estate. The negotiations are described as follows in the Chicago *Tribune*:

"The owners of a valuable piece of productive real estate in Wisconsin applied to the agents of a European house for a loan of $100,000 to further improve the property. The land tendered as mortgage security was appraised at from $600,000 to $700,000. The agent replied: 1. That the security appeared not only good but ample, and they were accustomed to rate Wisconsin men, as a class, as desirable borrowers, prompt and thrifty. 2. That they were then looking out for long-term mortgage investments, and had the funds here in bank, and if the land offered as security had been situated just over the border, so as to be in some such State as Illinois, they would make the loan forthwith; but—3. That, owing to the recent legislation, they could not make a mortgage loan on lands in Wisconsin at any rate or on any security whatever. That the holders of the Wisconsin railroad-bonds had really the same class of security—a mortgage on real estate—and it had been shown the title to the security was hazardous. That the European view of the case was that it was not a matter of policy or politics, but of common honesty; and for the present they wished to have no financial dealings in Wisconsin on any security that could not be moved out of the State as soon as necessary. The owners of the land, Wisconsin gentlemen of the best standing and responsibility, went away surprised and disturbed."

---

If an attempt to solve railroad problems has resulted in putting the State of Wisconsin into a particularly hot frying-pan, Massachusetts, as the result of similar attempts, seems to be plunging into the fire. This latter State now owns that enormous and greedy elephant—the Hoosac Tunnel—which has just swallowed another appropriation of $131,000. What shall be done with it is a question which brings distress to the visage and confusion to the mind of the average legislator. The State also owns over twenty-four thousand shares of the stock of the Boston and Albany Railroad, has (or had) a large pecuniary interest in the now bankrupt Boston, Hartford, and Erie road, and has smaller amounts invested in other roads. There are few States in which railroad questions have been more extensively discussed, and no other State, probably, in which so many of the most intelligent men have devoted themselves to the task of finding correct solutions. Nevertheless, the true spirit of Wisconsin legislation was exhibited in several bills recently introduced into the Legislature, which propose to restrict the earnings of the Boston and Albany Railroad to six or seven per cent. per annum. A large amount of legislation of some kind is asked for also by the recently-formed Cheap Transportation Association, an association which the Chicago *Tribune* thinks "has committed itself to the wildest theories about State omnipotence," and the proposed methods of which we cannot quite make out, notwithstanding extensive reports of public speeches and of conversations between members and newspaper reporters. The essential purpose of the Association, however, is to secure free or very cheap transportation for merchandise and grain between Boston and Chicago; and if this cannot be secured in any other way, then, in the language of one of the prominent members, the intention is "to move upon the Legislature." On the whole, perhaps no better State than Massachusetts could be selected as a field for experiment in railroad problems, especially if the people are disposed to attempt them. Almost every possible phase of railroad complication is now exhibited in that State, and the people are beginning to recognize the necessity of the establishment of some definite system of management and of ownership.

---

The third annual meeting of the Silk Manufacturers' Association, held in this city last week, was followed by the usual dinner at Delmonico's, and the dinner was followed by the customary speeches in favor of protection to "infant industries." How much longer this particular infant will require to be carried in arms is a question which should be easily answered in view of certain facts brought forward by members of the Association. The silk industry is now exceedingly prosperous, some departments having increased in production during last year no less than forty per cent. of the entire increase of the past twenty-five years. To our own knowledge, one large company of over thirty years' standing did more business in the month of April last than in any previous month of its history. The price of raw silk during 1874–5 ruled lower than at any time for the previous twenty years. The wages of operatives have been lessened, and the people have bought more largely of American silks than ever before. In view of these facts, and of the added facts that revenue frauds in silk goods have for years been notorious, and

that Government has recently lost through the operations of one man over a million dollars in two years, one might have supposed that these manufacturers would have discussed the amount of reduction in the tariff on silk goods which could be made with safety to themselves, with profit to the Government, and with great saving to the pockets of the general public. On the contrary, however, the speeches of the President, of Mr. Carey, of Judge Kelley, and nearly all the other speeches (with the exception of the witty speech of Mr. S. S. Cox) were in simple laudation of the benefits of protection. With one expressed sentiment of the President, however, we desire most heartily to concur, namely, that in which he "hoped the time is not far distant when American trade-marks and the English language will replace foreign terms and imperial and royal crowns, which have hitherto been almost necessary to give to American products a respectable passport even to public consideration." Some curious results have followed this use of deceptive labels and trade-marks. As we mentioned some time ago, when speaking of the names of New England towns, the village of Florence in Massachusetts received its name in order that its silk company might shave the truth more closely in announcing that its sewing-silk was manufactured in Florence, the name of the place being followed by the abbreviation Mass. in almost undistinguishable letters, and the label being printed in Italian.

---

The taking of testimony in the Beecher trial ended last week, and as we go to press the argument for the defence begins. In the meantime, a question which Mr. Beecher's congregation seems never to have troubled itself about has been raised in another quarter, and settled to the general satisfaction of the public. We refer to the withdrawal of the Rev. Geo. B. Bacon from the Board of Trustees of the American Congregational Union because that body insisted on retaining Mr. Henry C. Bowen as one of his colleagues. Dr. Bacon, when pushed for an explanation, said frankly, in effect, that he didn't think Mr. Bowen's Congregationalism of a kind which was entitled to a share in the management of the Union, while as for his religious connection, the publisher of the *Independent* was certainly no representative of Plymouth Church. Mr. Henry W. Sage, whom Dr. Bacon wished substituted for Mr. Bowen on the Board, no doubt unites all the desirable qualities for the office. At the annual sale of pews, however, it would puzzle an outsider to decide, as between two such high bidders for front seats, which of them was more devoted to the church. We believe Mr. Bowen makes a distinction between Plymouth Church and its pastor, and that he holds on to his pew and his membership by a sort of squatter sovereignty through every vicissitude in his relations to Mr. Beecher. Apparently, this is entirely satisfactory to the church, or has been hitherto; and as Mr. Bowen has long been known to be the bitter enemy of Mr. Beecher, we do not expect to see any movement made to drop his name from the rolls on account of the part he has taken in the trial. But will it not then occur to Dr. Bacon that he has been over-fastidious as to the company he keeps, and that the Christian fellowship of Plymouth Church and the tripartite covenant is not incompatible with "personal self-respect" when extended to the American Congregational Union?

---

A Catholic priest, Father Gerdemann, has just been acquitted in Philadelphia of a charge of embezzlement, though, as only a fellow-Catholic and a colored man stood out for him, he had a narrow escape. The facts elicited showed the extent to which the Catholic clergy are made bankers of the funds of their parishioners. With the loans and deposits averaging several hundred thousand dollars for successive years, Father Gerdemann built one of the handsomest churches in the city, and only after his marriage with a Protestant, the organist of his church, did the credit he had enjoyed fall to pieces. He seems to have been a very poor man of business, who kept his books in a slovenly way, and, although he was in constant communication with the Bishop, who is the great banker and tax-gatherer, there was no system of supervision and accountability. Apparently there was no intention to defraud either the church or the depositors, but the exposure must shake the confidence hitherto felt by the faithful who have deposited their savings, amounting in the aggregate to vast sums, with their priests. The proceeds of these build the great Catholic churches, seminaries, and other establishments; but as soon as income falls off, as it does in times like the present, the capital often beomes difficult to find. A case of undoubted fraud in a secular corporation has also come to light in Philadelphia, a prominent Democratic politician named Fry having been detected in the overissue of stock of a horse-railway company, of which he was president. The capital was ten thousand shares, and he increased it by forty or fifty thousand more, on which he borrowed three or four hundred thousand dollars. Mr. Fry was not a priest, but he was a church-member in good standing, and doubtless his credit was the better for it. The cheapening of iron brought ruin upon a furnace in the Lehigh Valley in which he was interested, and led, as a means of bolstering up the company's notes and his own, to the desperate expedient just described.

---

Erie has been dragged to the front during the week, and its unsound spots laid bare before the public. The Company has $578,000 interest on bonds to meet June 1, and $202,000 more July 1. It had been reported that the Company would be unable to pay these amounts without pawning some of its assets, the most valuable part of which consists of coal-lands. The directors very properly resolved that the true condition of the Company should be made known to the shareholders, and appointed a committee, consisting of the President, Mr. Jewett, and two Directors, Messrs. John Taylor Johnston and E. D. Morgan, to prepare a statement. This statement appeared on Saturday. It makes no mention of the floating debt, reported to be from $1,800,000 to $3,500,000, nor does it give a list of the assets of the Company. But it does show a most deplorable condition of affairs, both in regard to past management and present railway traffic. The bonded debt has been raised to $54,394,100, and a considerable part of the late issues yielded the Company less than one-half its face value. The net earnings during the first quarter of the year were much below the interest on the bonded debt, and rates were then higher for through business than they are now. The war between the trunk-lines which was begun by the Baltimore and Ohio and the Pennsylvania has injured all the roads, but none more than Erie, which is the least able to bear the losses of such a struggle. The statement, which gives a good deal of almost startling information in regard to the relations of the Erie with the Atlantic and Great Western, and with Mr. James McHenry and his London bankers, concludes by expressing the opinion that if aid is extended to the Company it may work out of its embarrassments, and in time become a solid property. The Company, it is known, has the offer of a loan from the Delaware and Hudson and the Delaware, Lackawanna and Western Companies, although no mention of this is made in the statement. These companies covet the coal-lands of the Erie, and make their offer of aid contingent on control of them. The speculation in Erie has been large both here and in England; the stock declined early in the week, more in this market than in London, and accordingly, large amounts, estimated at as high a figure as 50,000 shares, were sent across the water. The effect of these shipments was to make enough exchange to reduce materially the exports of coin for the week, and further, to have a very important influence on the foreign exchange market, which has since fallen to rates which preclude the export of coin at a profit. But this was not wholly due to Erie; another gold clique has been formed, and stands as a menace over the gold and foreign exchange markets. Bankers are anxious to sell bills, and buyers hold off, hoping to lend their gold at profitable rates each day. The banks continue to gain in currency, the legal-tender average being up to $59,300,000, and the surplus reserve being nearly $12,000,000. General trade during the week has been dull. At the Stock Exchange all classes of shares have declined. Mr. Bristow has called in $5,000,000 more 5-20's, interest to cease August 15, in response to a request of the syndicate, who have sold an equal amount of 5-20's in Europe.

## THE MORAL OF THE WHISKEY FRAUDS.

IT is certainly not because we put a low estimate on the conduct of the Treasury in the late raid on the whiskey manufacturers that we regret extremely the effect which it appears to be producing on the public mind. Nothing could be more creditable than the way in which the blow was both planned and executed by Mr. Bristow, and we may add that no other course was open to him under the circumstances. But the way in which a large portion of the press has received the matter leads us to fear that it may create or strengthen an impression that this is the proper way to prevent fraud and ensure the honest collection of the public revenue. The secresy and suddenness and completeness of the performance are things for which the people have had a strong taste ever since the beginning of the war, because they have been associated in their minds with many happy bits of service to the Government at very trying times. Mr. Stanton made his political fortune by this sort of *coup de main*, and so on a smaller scale did Ben Butler. It brings the Government out before the public eye in a sort of tremendous majesty, which during the dark days of the war carried comfort to many a fainting heart. How strong the hankering after it still continues to be in many quarters, even when it presents itself without a semblance of legality, without even the flimsy disguise of "the war power," was well shown in the indulgence with which some people regarded General Sheridan's late plan for the pacification of Louisiana. We do not say all this, we repeat, by way of condemning Mr. Bristow, or in even the smallest degree belittling his work. It is good work, the best possible work under the circumstances; but the circumstances are both dangerous and unfortunate. They are such, in fact, as to make it very likely that the catching of all these "whiskey thieves," far from putting an end to "whiskey rings" and other fraudulent combinations of a similar character, will probably ensure their revival and perpetuation.

Consider for one moment what has happened. The Secretary of the Treasury discovers, by means of outside informers, that a very large number of manufacturers in various parts of the country are engaged in the commission of systematic frauds on the Government on an enormous scale. Far from giving instructions, however, to the officers of the Government specially charged with the collection of the revenue to put the law in force against the delinquents, he carefully conceals from them all knowledge of his discovery, and indeed treats them throughout as accomplices in the fraud, and employs new and unofficial agents to bring his plans to maturity. The officers of the Government, too, on getting an inkling of what is going on, far from hastening to the support of their chief, at once place themselves at the disposal of the criminals, and render them every assistance in their power by information and otherwise, so that to outwit its own servants the Government is actually obliged to invent a new cipher. We speak soberly when we say that we know of no modern country in Christendom in which a parallel or anything approaching a parallel for this state of things could be found. We believe it would indeed be necessary to go further east than Turkey, possibly as far as Central Asia, to find anything like it. Things like it occurred in France under the old régime, but, we venture to say, neither there nor anywhere else in the Western world since the French Revolution. As we tell the story above, and we have told it without adornments, it reads like a huge joke, got up for a Presidential campaign; but the fact is that it is told by the Government organs themselves with pride and rejoicing, as if a great commercial country was to be congratulated on having its revenue collected in the nineteenth century by somewhat the same processes as those by which the kings of the Merovingian dynasty would have collected theirs, if they had had any.

Now, the cause of all this is very simple. There is nothing mysterious about either the "Whiskey Ring" or the connivance of the Government officers at its operations. There is nothing either about them at all peculiar to this country or this age. Both one and the other are natural products of human nature. If a tax is put on the manufacture of a commodity, dishonest manufacturers will evade it if they can; and if the system of inspection is lax, the manufacture will gradually fall into the hands of dishonest men in any country. If in any country, too, no pains is taken to secure honest and capable men for the work of inspection; if officers are appointed without reference either to character or capacity, paid small salaries, and made dependent for the retention of their places on favoritism and not on desert, they will either steal themselves or connive at stealing by others, or do both. This is not a law of politics simply, it is a law of business, which has been known ever since men began to pay other men for rendering them service; as a law of business, it is as familiar as his alphabet to every American above the age of ten. That the community should not be shocked by seeing the business of the Government taken away from its operation, is a striking illustration of the way in which use will reconcile the most intelligent communities to the most flagrant abuses and absurdities. For it must be remembered that the work of raising the public revenue is *business* in the strictest as well as largest sense of the term. It consists in collecting from some people what they owe, keeping the money safely, and paying it out to other people to whom it is due, under a proper system of accounts. In other words, it differs only in detail from the business of a banking-house. The Treasury, in fact, is a banking-house, carrying on business, not for private gain, but for public benefit, and the people of the United States guarantee it against the ordinary consequences of fraud and mismanagement, or, in other words, say to the managers, "Steal and waste as you may, we will honor your drafts and see that you do not become bankrupt."

Now, fancy a private banker filling his counting-room with clerks and porters at very low wages on the recommendation of persons who only knew them as active politicians, without exacting any guarantees of character and competency. Fancy his becoming aware that they were in league with outside forgers and gamblers, and were in the habit of assisting these persons in robbing the bank and falsifying the accounts; and suppose he were then to pass his nights with his private friends hiding under the counter in order to catch them, and, having caught them, were simply to dismiss them, and ask the gentlemen who had recommended them to nominate others of the same sort for the vacant places. Of course, such a banker would be set down as insane, and would very speedily disappear from business. Nevertheless, this is very much the way in which the banking business of the Government is at this moment being done. As far as our observation has gone, people are much more occupied with the vast extent of the whiskey frauds, and with the fact that the seizures will bring in a million of money or thereabouts to the Treasury, than with the condition of the civil service which has made these frauds possible; and yet the one is a very trifling matter, and the other all-important. The most violent remedy we have yet seen suggested for the corruption of the service is that "the guilty officers must be retired," which is no remedy at all, because after they have been "retired" the persons who recommended them will be requested or allowed to supply others of precisely the same sort for the vacancies, who will be employed on precisely the same terms; and the "whiskey thieves" will begin once more, after a safe interval, to weave a new web of fraud, and the revenue officers, mindful of the shortness of their tenure and of the uncertainty of life, will once more go into partnership with them, and so on *da capo*.

There is no real remedy except in a change of system. The collection and disbursement of Government money must be performed by the same kind of persons and under the same guarantees as to accountability and integrity as the money of individuals or corporations. Money is money, no matter to whom it belongs, and rouses just the same passions, creates just the same temptations, and has to be protected by just the same barriers. That the honest people of the United States should allow the politicians to treat the public funds as mere stakes in a game of chance is a most disheartening phenomenon. A private individual who threw temptations in the way of his employés and filled his business with premiums on

knavery and discouragements for integrity, would be justly reprobated, even if swift punishment did not come on him in the loss of credit. How much stronger should be the reprobation visited on a system which makes the public taxes an instrument of wholesale demoralization of the community! When one reads the wretched fashion in which the Government organ glories in the shame of a revelation which shows the civil service to be rotten to the core, one's amusement is apt to lead him to forget the amount of corruption of character and destruction of morals which lies behind these whiskey frauds. Probably not a barrel of whiskey escapes taxation without destroying in hundreds of men all sense of duty to the state, as well as shaking their confidence either in the existence of honesty or in its value.

## THE FUTURE OF LEGISLATURES.

IT is much to be feared that the public at large throughout the United States do not give to the proceedings of the remarkable body which is now in session at Albany the attention they deserve. The present Legislature is, we believe, admitted to be a fair specimen of a New York legislature, and it is engaged in solving one of the most difficult problems that can present itself to the people of a powerful and wealthy State like New York—how to preserve for the State the public works on which its prosperity depends, and at the same time to free them from a corrupt method of operation which has become almost a vital part of the system itself. No one, of course, would expect such an important matter as this to be finally disposed of by any respectable legislature without a great deal of debate, the examination of many witnesses, and much deliberation in committee, but it is a curious fact that in the present case the very reverse of this is true; and what the public strongly desire, and loudly demand, is that the Legislature shall neither debate, discuss, nor trouble itself about committees, but simply adopt the recommendations of Governor Tilden—put the whole thing in his hands, and go home. The reason of this public impatience on the subject is not far to seek. The public have no confidence that the debates will be real, that the motives of the speakers will be those assigned by the speakers themselves, that the committees appointed will be appointed in the interest of a fair investigation, that their report will be honest, or, in short, that the Legislature—a fair average, ordinary Legislature—will not improve the occasion given by the time necessarily occupied in debate to "sell out."

That the public is quite right in its suspicions there is no need to prove, for the suspicion is not of recent growth, but the product of public observation of the proceedings of New York legislatures extending over a series of years—the result of which is a conviction that the legislature is representative in the main only of private and personal interests, the exact nature and extent of which can only be vaguely guessed at, and cannot in any way be calculated upon; that it has lost most of the best traditions of parliamentary work; and in any struggle between public and private interests the best thing it can be expected to do is to allow some other body, the executive here, or a commission there, to undertake the work. If any proof were needed that this is a generally correct view, we might point for corroboration to the extraordinary proceedings of the Speaker of the Assembly at the present session. Mr. Maguire is, according to his own professions, a reformer, and in his first appearance in that character made a ferocious and unsuccessful attack upon the reputation of Mr. Ezra Cornell and the college founded by him. From a person so zealous in the cause of morality, we should of course have expected a rigid and dignified administration of the responsible office he now fills. But it is quite evident that the old-fashioned idea of a Speaker as an impartial presiding officer, though it still lingers on at Washington, has quite died out at Albany. The idea of the office there obviously is that it is one which gives a member of the Assembly so much the more power and influence, because the possession of it enables him not merely to take part in the debates, but alternately to make stirring speeches backing up his friends or attacking his enemies, and then to appear suddenly in the character of presiding officer with absolute power to "rule" in any way he pleases. The right of a Speaker of a parliamentary body to call some member to the chair has never been questioned, but it is one of the most dangerous rights he possesses, and the use made of it by this statesman is very like the use made by partisan legislatures of the right to be judges of the qualifications of their own members. We say all this without meaning to impute corrupt motives, for the most remarkable thing about the proceedings at Albany this year, to our mind, has been, not that an active, pushing politician like Maguire should, having got possession of the Speaker's chair, have become, as his fellow-politicians genially say, "irrepressible," but that the Legislature itself should apparently be so totally lost to a sense of the traditions of legislation as not to know, or at any rate give no signs of knowing, that this sort of Speaker would inevitably in a short time turn the "halls of debate" into a bear-garden.

Legislation, in the old sense, has almost ceased to exist in New York. Look, for instance, at the question of municipal government. Mr. Tilden has recently sent a message to the Legislature on this subject, with the object not, as would have formerly been the case, of inviting the attention of that body to the consideration of the subject, but of inviting that body to refrain from having anything to do with it, namely, by putting it in the hands of a commission. Governor Tilden's action receives the most deserved approval, and when his commission has reported there will in all probability be a strongly expressed popular demand that the Legislature shall perform its duty by shutting its eyes and adopting the report. The only intelligent discussion of the wasteful and oppressive tax system of the State has come, not from the Legislature at all, but from two commissions, one appointed for the purpose by the Governor, and the other the Tax Commission of the City of New York. As to the railroads, which were a few years ago a constant subject of legislative discussion, the last vestige of an expectation in the popular mind of anything in the way of intelligent supervision was dissipated by the disclosures which came not long after the passage of the Erie Classification Bill. The present state of the case at Albany is that the approach by the Legislature of any subject in which many rights and vested interests are involved is viewed with alarm, and beyond a hope that the Legislature may give the Governor power to appoint a commission to investigate frauds or consider municipal government, and that it will let other things alone, very little is hoped or expected of it. Its debates are treated with contempt or not listened to; its members' names are frequently printed in the newspapers as those of thieves, and its traditions as a parliamentary body are laughed at. A public body reduced to this condition of imbecility and in this general contempt cannot but suggest many speculations of a painful kind. Are these decaying bodies to die out and disappear, and leave not a wreck of popular institutions behind them? Are we doomed in our generation to see the old vicious circle of politics renew itself—freedom resolving itself into anarchy, and anarchy in turn bringing in force? It must certainly be admitted that the public odium into which the Legislature has year by year brought itself has become so great, that if the power of dissolving a legislative assembly had been retained by our system in the hands of the executive, there can be little doubt that it would have been exercised several times within the last few years, or, if not actually exercised, would have been held *in terrorem* over the heads of the members, to the great comfort of a majority of the inhabitants of the State. To a very large number of the inhabitants of this city it would probably have been with a sense of profound relief that they would have heard of a Legislature, when on the point of proceeding to the consideration of the charter question in some one of its many forms, being turned out of doors by some popular Governor. A year or two since, when Mr. Green was more popular than he is now, if it had been a question of either sending the Legislature about their business or retaining Mr. Green in office, there can be little doubt how it would have been settled.

The important question, to what the present condition of legis-

lative bodies—we may almost say their degraded condition—points, is one which is generally answered in a variety of ways, depending rather upon the temperament of the questioner and his political associations than upon any process of reasoning. If he is an ardent believer in "our institutions," he generally thinks that we are merely in a "transition period," or, as he sometimes puts it, a "phase"—an answer which may or may not be true, but adds nothing to the solution of the problem. If he is of a sceptical turn, has travelled a good deal abroad, or has lived long in New York, he is generally ready to settle the question off-hand, with an amused smile at the simplicity of any one who can ask it, with a few well-known formulas, to the effect that we are going through the experience which old nations have gone through before us; that democratic institutions do very well for a thinly-settled, new, and fundamentally democratic society, but are out of place in a wealthy and populous state; that what we need in this country is a "strong government," and that we may be sure it will come sooner or later. This answer is hardly more satisfactory than the first, for the only indication, in this State at least, of the appearance of a "strong government" was that given by the Ring, or, in other words, a government of thieves and murderers.

Most sensible persons, however, who are neither sceptics as to "institutions" nor enthusiastic devotees of them, would probably say that the chances are a thousand to one that for an indefinite period of time—certainly as long as the present generation are on the stage—the legislative problem will still remain unsolved. That is to say, legislatures will continue to be elected, assemble, pass a certain number of bills, exhibit a vast amount of ignorance and a good deal of corruption, be abused in the newspapers and denounced upon the stump with good reason, and they will neither become pure and intelligent, nor will they be sent about their business by any man of destiny with an army at his back. There will continue to be the same elective machinery as at present, and the same corrupting influences will be at work as are in operation now. In considering, therefore, what is to be done with legislatures, we must take these things into account. What is the moral, then, of the situation? Simply this, and it is a moral which the proceedings of many constitutional conventions show is becoming well understood: that the legislatures are bodies which need to be hedged in and fenced about with every sort of restraint and prohibition that can be devised, that they constitute a part of the Government which we can best afford to abridge in its prerogative without at the same time having much fear that in doing so we are striking at the root of popular liberty. In all probability the world has already passed through the heyday of legislation; the era of brilliant schemes of reform, of gigantic extensions of the suffrage, and of parliamentary oratory, is gone; and the legislatures of the future will be humdrum bodies, whose greatest need will be a close attention to business, and whose greatest danger will be the possession of prerogatives handed down from a time when there were real parliaments.

## ART AND ADVERTISING.

BALZAC, discerning in advertisements as agents for the rapid acquisition of wealth an element of surprise and romance, made use of them in *César Birotteau*. The custom which he thus graced with an unlooked-for literary association has since then so expanded as to call for a more solid and systematic treatment; and we have now a 'History of Advertising,' recently published, which applies antiquarian research to the subject. Advertising, however, on the scale and in many of the forms by which we know it, is essentially a modern habit, and its history before the beginning of this century is meagre. No attempt has been made in the compilation just mentioned to give the larger relations of the theme; but a short discussion of some ethical and æsthetic bearings of the practice would not have been amiss in a history. To most persons, no doubt, there would be something laughable in the first suggestion of associating advertising with a matter that has called for so much profound and subtle thinking as the relation of art and morals. But on a closer inspection the absurdity diminishes. For we must admit that the moment the simplest typographical form of advertisement is departed from, effects of line, proportion, light, and shade begin to be introduced and something having a decorative character is tacitly sought for. In many advertisements outside of those in newspapers and other periodical products of the press, solid form and color are called upon to enrich the result. Thus we see at once that the elements of decorative design are all employed, though crudely.

The primary intention in advertising is simply to furnish notice or record of various opportunities or transactions in which a large number of people may be expected to take an interest. The force of competition entering in, this first purpose undergoes more or less modification, according as different advertisers are able to pay for unusual modes of announcement. It is evident, then, that the decorative or artistic character is a clear gain commercially to the advertiser. To this fact we owe that variety of ingenious device the observation of which has in these days become really a curious and amusing study. We have long been familiar with notices printed in large letters, each one of which is made up of the same character in a smaller size many times multiplied, on the principle of the East Indian symplegmas; but the variety and vivaciousness of advertisements have greatly increased in the last ten years, and this is but a simple-minded invention compared with others of an almost diabolical cast which have more lately come into use. The preparation and placing of advertisements of all sorts have assumed the proportions of a business by itself, to which the entire time and thought of a number of men are devoted. Some of these are hired to display themselves in outlandish trappings or encased in a canvas armor adorned with painted letters. The possible extensions of this system are hinted in an incident we remember reading of, a year or two since. A merchant in an English country-town employed a farmer to carry on his back a placard respecting the sale of some manures, and paid him five pounds for two hours' service. When it was discovered by other farmers that this strange addition to his costume was due to a lucrative bargain, there were numerous applicants for similar employment, some alleging that their backs were broader and more elevated, and therefore better adapted for "advertising purposes" than his. Still stranger than this was the case of a judge in one of the remote counties of New York, who once consented to dance breakdowns within a small enclosure at a fair which had been opened to benefit a church; the spectacle of a sedate and venerable lawyer parting with his dignity being held by public opinion in that section to be worth twenty-five cents (the amount fixed as an admission-fee to the judge's entertainment).

These stories are in point as showing up the singular artificial values created by the spread of advertising. Mountains, trees, curb-stones, railings, fences, and dead walls have acquired a new interest for speculators. Even air-space has become marketable. To tell a thing from the house-tops has, in fact, come to be a common business operation. There appears nightly upon the roof of a building on Broadway a large circular spot of greenish light thrown on a screen, and looking like a disabled moon that has drifted too low and got caught among the chimneys, upon the luminous disc of which appear alternately pictures of a simple kind, adapted to the gaze of a mixed crowd, and advertisements of various desirable goods for sale by various people. It was genuine cleverness which called mirrors into the service of advertisers, for in the moments of *ennui* unavoidable in railroad waiting-rooms all men and women are apt to refresh themselves with a glance into the glass and so be entrapped. The occasion is a good one for accident-insurances in especial. But these instances illustrate rather the artfulness of advertising than its connection with art. Among examples of the latter, however, may be mentioned the circulars of a few insurance companies and the almanacs of some publishers. The system of panel-advertising also, though still undeveloped, contains possibilities of fair decorative effect. The broadsides and posters in common use are for the most part negative examples, for the contrasts of color in them are generally ill-judged, though a little knowledge will suffice to make them otherwise. A manager in London got an Academician some time ago to design a poster; the artist confined himself to black and white, and, recognizing the necessity for simplicity, drew his figure in bold outline. It was that of a woman issuing stealthily from a doorway into the night; a black field behind her, filled with large, white conventional stars, suggested this and supplied a profound echo, as it were, of her attitude and gesture. The effect was very impressive; but the manager must needs follow it up with a small and inferior copy which had no effect at all. Here we find intimated the telling influence of genuine artistic feeling in this office of commerce, and in the manager's action we detect the average ignorance and want of appreciation of advertisers. Not understanding the value of artistic principles, their present indiscriminate and boisterous endeavor is merely a heightening of the general scale without corresponding advantages to the individual.

The strain and stress of self-recommendation now in vogue resemble the shouting of hackmen at a railroad station; and the man who can keep up the outcry longest or invent the most peculiar howl, stands of course the best chance of gaining his end. But there is room for a doubt whether the achievement is an equivalent for the effort made. In reality, the whole system betrays at this point a weakness; for so soon as exertion in any case begins to exceed its due proportion to the effect, we may argue that disaster impends. The practice may, then, in time defeat itself. And meanwhile it seems worth considering whether it be advisable to go beyond the more orderly and subdued methods of straightforward announcement usual in the columns of respectable journals.

But if advertising is to be carried beyond this, one would be thankful for some intervention against what now threatens to become an extremely exacting and unavoidable tyranny of traders. To hope for legislative restrictions in this direction is not wholly chimerical; some of the States have already interposed on behalf of mountain-sides and boulders as against certain pertinacious bitters and rare ointments. Let us observe how Lessing sets forth the philosophy of governmental control over the aims of art as exercised in Greece. "Undeniably," says he, "the law must never assume a control of the sciences, for the aim of the sciences is truth. Truth is necessary to the soul; and it becomes tyranny to put the least restraint upon the pacification of this its essential need. The aim of the arts, on the other hand, is pleasure, and pleasure we can forego. By all means, then, let it depend upon the lawgiver what sort of pleasure he will allow and in what measure of each sort." Accepting this as in the main reasonable, we shall find good ground for curbing the tendency toward universal and obstreperous bill-sticking. For this has neither pleasure for its end nor always truth. The aim is almost purely selfish—a result of the desire for acquisition. Now, the wish of one trader to appear at better advantage than his rival has gradually led from statements based on really superior foresight, energy, or resources to very equivocal announcements and the setting afloat of appearances not true to fact. We recall the case of an illustrated paper published in Rhode Island, which, to secure the favor of the public, offered a chromo-lithographic copy of one of Eastman Johnson's paintings as a gift to every subscriber; and, in making this offer, the proprietor demurely quoted as applying to their lithograph some laudatory sentences from Mr. Whittier, called out by Prang's lithograph of the same work. The inference clearly intended was, that they were about to present their subscribers with copies of precisely equal merit to that which had elicited Mr. Whittier's praise. But the chromo supplied turned out to be a different and entirely inferior one. A second flagrant example of dishonesty is that set by a young man who, in order to increase the sale of Webster's 'Dictionary,' for which he was agent in the Southern States, issued an anonymous circular containing extracts from the rival lexicographer Dr. Worcester's 'General History,' from which it appeared that that scholar had alluded to the Confederates as "rebels." But he neglected to mention, or at best to discover, that the chapters from which he had quoted were found in a revised edition of the work, and had been written after the Doctor's death and presumably without any "materialized" apparitional intervention on his part.

The atmosphere of suspicion engendered by practices like these has its inconveniences and seems to us to be extremely vulgarizing. Advertising on such principles is not confined to the counting-room; hired silver and liveried servants, supplied by a company on occasional private need for the effect they produce, are a part of its machinery; and overdressing to give a false impression of wealth is another aspect of it. So acute and distrustful has the computation of advertising values grown to be in consequence that it is even unpleasant for a man to defend himself from improper public mention by a reply through the newspaper, because of the imputation to which he lays himself open of wishing to increase or announce his own importance. The trouble with this sophistication is precisely that it can so easily become unjust in its judgments. These judgments have their root in bad taste; and it may safely be said that such bad taste is closely allied to and more or less dependent upon those very defects of literary and artistic judgment to which so many advertising errors are traceable. Many of these are laughably absurd. But from being amusing they pass, by stages which it would be easy to mark in a graded selection of specimens, into the seriously dishonest. We come at last to real indecency, like that of an illustrated advertisement depicting a man in his coffin, sitting bolt upright, with this drastic explanation over his head: "Killed by Catarrh!"

A careful adherence to taste, therefore, may check the insidious tendency toward disreputableness noticeable in some kinds of contemporary advertising. Not that this would be synonymous with the eradication of dishonesty from this pursuit (as neither can it be expected that a noble style of painting or sculpture is going to remodel human nature throughout); but the more thoroughly the principles of art are applied to industrial pursuits, the greater is the chance of ameliorating defects like those we have been describing. In itself, there is of course nothing objectionable about advertising; it is, on the contrary, a token of healthy energy. And the ingenuity used in it may even command admiration, though it can never be the index of any intellectual effort above the level of shrewdness. But when this shrewdness asserts itself at the expense of qualities infinitely superior, it becomes time to reprove and repress it. That all advertisers are not likely to apply canons of critical taste at once to their business is very true. But the application is desirable, nevertheless, for it means simply the economizing of effort; instead of an indiscriminate uproar, we should have the trained utterance of people skilled to speak for the farthest effect with the smallest outlay of exertion. Indiscriminate street-advertising, we should say, ought to be abolished as being unsightly, mentally disturbing, and a decided inconvenience to the eye, which is impelled by means of it to look where it does not want to look. On the other hand, we should consider good advertising papers, printed in color, with significant but consistent and harmonious designs, a gain. Refinements upon the blunt insistence of shop-signs as they at present exist would seem to be quite in order also. We have seen various efforts, more or less successful, made within a few years to give these a correct decorative shaping, but it is easier to point out instances of ambitious buildings quite disfigured by the signs upon them. Théophile Gautier has thrown out the idea that decorative signs may in time give rise to a new order of architecture. We hardly think an order could spring from so slight a source; yet much might come of an effort to develop the better capabilities of signs. In connection with these, different trades might get to expressing themselves in appropriate ways on the faces of the houses used for them; not necessarily by unalterable changes of structure, but by architectural members admitting of entire detachment and removal, for which iron might be found to be an appropriate material. The nearly transparent wire screens sometimes erected at the edges of roofs and bearing gilded letters, which are thus brought into relief against the sky, will assist the imagining of such expedients. But such improvements as are here barely suggested cannot be made without long delay, for they imply conditions of social and political discipline which do not as yet exist among us. It is improbable that we shall succeed in covering the present deformities of the advertising system with any cloak of a decorative texture, or enclosing its various ugliness with the circle of Giotto, while our rural population continues to revere that green-eyed monstrosity in white which is with us the type of a thriving home in the country, and while the national taste in household art sanctions that style of parlor-stoves the chief aim of which seems to be to secure on a small scale pseudo-resemblances to Gothic minsters.

## GETTING A DOCTOR'S DEGREE IN GERMANY.

[The following extracts from a private letter will, we believe, be found to have a general interest.]

HEIDELBERG, March 6, 1875.

. . . I suppose my postal-card reached you a day or two since. I ought to have written you at length before this, but my nerves are rather unstrung after the excitement through which I have passed, and I have been exposed to a perfect flood of invitations from all sides.

Now, as this is going to be a "doctorial" letter, I must give you a little account of how the degree is obtained in Germany and what it denotes. The right to bestow the doctor's degree belongs to all of the twenty-two German universities. The degree of D.D. is honorary, and is bestowed only on eminent theologians. The degrees of M.D., LL.D., and Ph.D. are, however, only gained by passing severe examinations; and with one or two exceptions, the universities guard the honor of the degree very jealously. It is the only door through which one can gain admittance to a professor's chair at the universities. In the philosophical faculty at Heidelberg, there are five grades to the degree, denoted on the diploma respectively by the words, 1°, summa cum laude; 2°, insigni cum laude; 3°, multa cum laude; 4°, cum laude; 5° (without any designation); or in English: 1°, with the highest praise; 2°, with distinguished praise; 3°, with much praise; 4,° with praise; 5°, without any praise to speak of. The first degree is very rarely gained; perhaps one out of ten among the German doctors obtains it, but only after many years of work. Most of the German scientific students are very happy if after several years' residence at the university they can boast of a second degree, and a great many have to be satisfied with a lower rank. The candidates for Ph.D. have to select for their examina-

tion a principal subject in which they are supposed to be thoroughly versed, and two other departments of knowledge in which such an intimate familiarity is not required. An examination in classics must also be passed, as the degree of M.A. is bestowed at the same time. Not long after the commencement of my student-life here, I saw that it would be of great advantage to me in my scientific life to possess such a rank, which has recognized worth in all the world and is not obtained by friendship or favoritism, as is so often the case in America. So I directed my studies in such a manner as would be of the most advantage to me in this project, although it seemed very doubtful whether I could ever reach such a point that I would dare to face an examination in a foreign tongue. (The privilege granted to candidates of performing the examination in Latin is unfortunately not of much use.)

Last November, I made up my mind that the ordeal must be passed before Kirchoff left the university. I did not write of my determination, because I had constantly before my eyes the dread of "falling through," as the Germans term a failure to pass—a fate which more than one of my friends has met with during the past year, and which set one of them nearly crazy. For the same reason I did not tell my most intimate friends here, as I did not wish to have their anxieties aroused any more than yours. My friend H—— set out with the same object in view, and we studied together. My principal subject of course was chemistry, and the secondary subjects were physics and mineralogy, which are themselves so necessary to the chemist. Of the authors I have read, and the amount of knowledge that I managed to cram into a head of unusually small size, I cannot give you much of an idea. Since Christmas I have read between 25,000 and 30,000 pages. By the 1st of February Dr. Brown's document reached me, and you can understand now why I was so anxious for it. I now summoned up my courage and prepared to announce myself as a candidate. I wrote in German an appeal to the faculty that they would permit me to appear as a candidate. Then in the most classical Latin at my command I drew up my autobiography, giving a full account of my education to the time when "I entered the walls of my Alma Mater Heidelberg and enjoyed the opportunities of listening to its eloquent and learned professors." Fortified with these documents, with my pass, my certificate that I was an A.B., and a Hamilton-College catalogue containing the record of my honors and prizes there, I paid a visit to the dean of our faculty, Dr. Weil, professor of Turkish, Arabic, Syriac, etc. He received me very kindly and read my papers with great satisfaction. I told him that I wished to escape the classical examination, as my acquirements in German were confined principally to scientific subjects, and it would be excessively difficult for me to translate from a foreign language into German. My previous classical studies in English had extended, besides, far beyond what was necessary for the examination here. He pulled down some old musty author whom I had never seen before, and let me translate a passage. I rendered it quite easily—although I am a little rusty in Latin—being bothered only by one passage, in which the Professor himself was stuck. He was quite pleased with the result of the test, and told me to come the next day. That evening he laid my papers before the faculty. They granted my petition, and, further, the philologs decided that a classical examination was quite superfluous in my case. About a week later the head-beadle appeared, and announced that the philosophical faculty desired the pleasure of my company at 6 P.M. on the 3d of March. My Sandwich-Island friend H—— went through the same ceremonies and had the 2d assigned as his day of execution. He had passed only two years at Cornell, however, and had not received his degree, so that he was not freed from the classical examination. His father is German, and he has been a year longer here than I, so that it was not so difficult for him. Things now began to look serious. Neither of us had any hope of obtaining a high rank, but we had the greatest fear of failing and the consequent disgrace. I was quite disgusted with myself to find how perfectly the whole affair had taken control of me. I thought I had grown too old to be affected by such things. But there was such a dreadful uncertainty. To be examined by the most renowned chemist and the most renowned physicist in all Europe, and, further, to be examined in a language which I had only practised for a little over a year, altogether made me feel rather shaky. My sleep was disturbed by ugly dreams of coming failure, and often it was utterly impossible for me to concentrate my attention on the book before me. The days and weeks flew by with leaden wings. It seemed as if I could not bear the suspense until my doom was decided. H—— was equally excited, and we counted the days and hours until we could be certain of our fate. At last the day before my examination came. At noon I was to visit the various professors who were to examine me, and give them a formal invitation to the ceremonies. Attired in a regulation suit of black, with swallow-tail, white tie, stove-pipe, and white kids, I paid my visits. I felt just about as comfortable as if I was in a coffin. The professors received me very cordially, and I had pleasant little chats with them. Bunsen rushed out of the laboratory, met me in the hall, and, as is his custom with all candidates, said that as I had other visits to make he would not detain me, and then dodged back again. That evening H—— passed nicely, and that took a load off my mind, especially when it was announced the next morning that he had obtained the highest degree. I thought then that surely I could pass, although a "first" would never be my lot, for he had studied a year longer than I at the university. After the first outburst of joy over his success, I felt jealous for about five minutes, as I thought that we could not win the same rank—something we had both wished for very much. But I soon overcame that feeling. I ate a light dinner, and afterwards did not try to do much studying—following a very earnest injunction of Prof. Kopp.

At three o'clock, C—— and "Dr." H—— took me off for a long walk, keeping up a lively conversation and not allowing my thoughts to run upon the fast approaching ordeal. At five we returned; after a little rest, I got into my costume again. Despite my friends' endeavors, I was in a state of most intense excitement. They escorted me to the Senate Chamber, and, with many a parting word of encouragement, greeted me for the last time as a student.

I was received by the beadle in the prorector's office, a sort of ante-room. One after another the professors dropped in, deposited their coverings, and disappeared in the room beyond. I paced up and down nervously, smoothing the wrinkles out of my gloves. Finally, Bunsen rushed in, gave me a little nod, threw off his large fur mantle, and dodged into the next room. That was the signal for the tortures to commence. The dean appeared at the door and requested me to enter. Before I was directed to a vacant chair, I had time to cast a hasty glance about the Senate Chamber. It is the scene of the faculty deliberations; a comfortable-sized room, tastefully decorated with pictures and busts of eminent personages in the history of the university. In the centre is a long, green table. About this were grouped the professors in luxurious arm-chairs, the dean sitting at the head. By the side of Bunsen was an empty chair—for the victim; and on the table in front lay paper and pencil. I took my seat rather awkwardly, feeling a little scared and lonesome amidst all these grave and dignified professors. Bunsen sat for a minute without uttering a word, while I made a vain endeavor to look happy and unconcerned; then he suddenly turned around and asked me to give the oxygen compounds of arsenic. As soon as the word arsenic left his lips, I forgot my excitement, and was at once cool and collected. He had started on a subject where I was perfectly at home. Then followed question after question, nearly all of which I answered quite correctly. I made two mistakes of a very unimportant character. Bunsen examined me in analytical and inorganic chemistry, and, after I had given an account of a delicate reaction for arsenious acid which he had discovered himself, looked very happy and satisfied, and gave up his seat to Prof. Kopp. His department was theoretical and organic chemistry, and he started off with oxalic acid, from which he branched off into quite a variety of subjects. I wrote down all the formulas he wished, answered his questions promptly and correctly, and when he rose could scarcely believe that the first hour of the examination was past.

A recess of ten minutes now ensued. On a side-table were several bottles of wine and plates of cakes. The dean and Kopp urged me to take a glass of wine with them, but I contented myself with a few sips of water and a macaroon. I now had an opportunity to study the faces of the professors better as they made a more vigorous onslaught on the provisions. There was Stark, the prorector, a little old man with kindly features, one of the most noted archæologists in Europe; Pagenstecher, the professor of anatomy and zoölogy, looking so thin that I concluded he must use himself as a specimen in his lecture-room; Baron Reichlin-Meldegg, noted for his lectures on Faust and for the invariable readiness he shows at doctors' examinations to assist in clearing off the refreshment-table. His reputation in the latter direction, as I can well testify, is based on good foundation. Then there were a number of others famed in this or that branch of science, and last but not least my four examiners, who together form a quartette which no other university in the Fatherland can equal, but which has now lost one of its brightest lights by the departure of Kirchoff. After a little chat with Reichlin-Meldegg, who showed a great interest in the American methods of eating and drinking, and told me of what a good dinner they were going to have next Sunday in honor of Kirchoff's departure, I noticed that the professors had emptied the bottles and were resuming their seats. I noticed also that there was a secretary present, who took down all my answers, to refer to in case of disagreement among the professors at the final decision,

Prof. Blum now sat down by me and questioned me in mineralogy. I was troubled somewhat in my language while trying to answer questions in crystallography, and did not make a particularly brilliant show. Finally came Kirchoff, who ran rapidly through the theories of light and electricity with me, and at eight relinquished his seat. Then the dean requested me to step into the ante-room. I was there but a few seconds when I was summoned back. The faculty were all standing up facing me. At their head was the dean, who delivered a short oration, announcing that they had decided to confer upon me the degrees of M.A. and Ph.D., and that I was to appear the next morning at eleven. The professors bowed low; I bowed lower still and retired, feeling that at last I could breathe freely. I hurried on my overcoat and stepped into the hall, where a crowd of my student friends, representing every quarter of the globe, were waiting to congratulate me. The hand-shaking was scarcely finished before the professors began to appear, showing that it had not required much time to decide on the rank I should assume. We had to scatter, and went at once to see Mrs. H——, who was awaiting in great anxiety the result of the examination. She gave me a comical picture of how her husband acted when he learned that his boy had come through all right. He was so excited that he had to take off his coat and dance around the parlor. I was weary and faint, and sought in vain to sleep after reaching my room. I had made several mistakes in my examination, and had not expressed myself very well, and finally came to the conclusion that either the second or third degree would be assigned to me. It was better than I had hoped, and on that decision I went to sleep.

The next morning at nine I went around to H——'s room. As soon as I entered, he threw his arms around me and exclaimed, "You've got *summa cum laude!*" I would not believe him; but there was the beadle, who had brought his diploma, and he confirmed the news. The announcement seemed to take away my strength, and I had to sit down. It is an honor that no German scientific student for eight months has gained, and, best of all, my friend and I had the same rank, which made us very happy. Then we went to Bunsen's lecture, and at its close I had to receive congratulations from all sides, the American students being specially jubilant, for the traditions give no record of any American having won the first degree before. At eleven, I presented myself again at the Senate Chamber, as before, in evening costume. The dean and secretary in similar dress stood before me, on one side the two beadles with silver maces. The secretary read off a long premise in Latin; at its conclusion the beadles crossed the maces before me, and, resting the first three fingers of my right hand on them, I replied, "Confirmo et polliceor, sic me Deus adjuvet." The dean then read off more Latin and congratulated me very warmly on the honor I had obtained, telling me that the faculty were unanimous in the decision. The beadle brought me my diploma the next morning, with about twenty-five copies on thin paper, which I have used, in the regular German fashion, to inform my friends of the event.

# Correspondence.

## THE ROMAN LAW AND THE GRANGERS.

To the Editor of The Nation:

Sir: The invalidity of Granger legislation may be shown by reasons which lie back of the Constitution of the United States. The provision in that Constitution, that no State shall pass any law impairing the obligation of contracts, introduces no new sanction, being simply a formalization of a cardinal maxim of jurisprudence, viz., that no statute is to be construed to retrospectively affect vested rights. I give on this point a condensation of Savigny's exposition, contained in the eighth volume of his great treatise on Roman law ('System des heutigen römischen Rechts,' Berlin, 1848, Bd. viii., § 392):

"The law which is to be applied to contracts is that which existed at the time when the contract was entered into. This rule is applicable to the capacity of the parties; to the form of the contract; to the conditions of its validity; to the manner and degree in which it is to operate. And by the law thus existing at the time of the execution of the contract are we to determine all questions as to its validity or effect, however these questions may arise.

"The parties to a contract have a right to insist on this rule, irrespective of the interference of any subsequent legislation. This is a vested right, which the legislature cannot impair. . . . Even a positive prohibitory law cannot be construed as preventing the enjoyment of such right."

He gives two illustrations which bear on Granger legislation:

"A person who by the existing law has reached majority makes a contract. By a subsequent statute, this person is declared to be a minor. This does not affect the validity of the contract made under the prior law.

"A person under the old Roman law is made infamous by a statute of attainder, under which he is held deprived of business capacity. Yet, notwithstanding this statute, contracts he made before its passage continue to operate, and his estate to be bound by them; and his business capacity as to such contracts continues.

"Under the old Roman law, women could execute contracts of suretyship (Bürgschaft). By the Sc. Vellejanum their capacity in this respect was restricted. The restriction operated on contracts made subsequent to the statute; prior contracts continued to operate continuously, notwithstanding the statute."

To apply these positions to Granger legislation:

A statute is passed giving a corporation unlimited power to take tolls and to borrow money, the interest of which these tolls are to pay. Money is borrowed in pursuance of this power, the contract being that the tolls are to pay the interest. No subsequent statute restricting the power of the railroad in respect to tolls can affect either its right or its duty to levy such tolls as would best enable it to fulfil its contract. If, to follow the analogies of the Roman law, a bill should be brought against the corporation by the bondholders to compel it to impose adequate tolls, it would be no defence that the legislature had forbidden the tolls to be levied. The statute to this effect, no matter how potent it might be as to the future, could not be construed to affect engagements validly made in the past. And Savigny argues that this rule is one of those fundamental maxims which courts cannot disregard. If a legislature can invalidate a contract valid under a prior law, the foundations of society will be destroyed; for in this way faith would be lost not only in the validity of *contracts*, but in the validity of *laws*.

F. W.

Cambridge, May 14, 1875.

## ENGLISH VOCABULARIES.

To the Editor of The Nation:

Sir: Having read with considerable interest the recent communicated articles in your paper relating to "English Vocabularies," I thought the following figures might prove interesting to some of your readers.

Last year, in carrying out instructions relating to a cipher system for daily telegraphic reports of professional work, I found it very convenient to know the number of words in each column of the Academic edition of Webster's Dictionary, published by J. B. Lippincott & Co., Philadelphia, 1872. With but little additional labor, and as a matter of curiosity, the following table was prepared, giving the number of words under each letter of the alphabet:

| | | | |
|---|---|---|---|
| S | 3,706 | G | 900 |
| C | 3,588 | W | 805 |
| P | 2,807 | O | 757 |
| T | 2,752 | V | 641 |
| D | 2,230 | U | 594 |
| A | 2,129 | N | 563 |
| I | 1,963 | J | 277 |
| B | 1,657 | Q | 178 |
| M | 1,641 | K | 172 |
| R | 1,637 | Y | 72 |
| E | 1,522 | Z | 66 |
| F | 1,348 | X | 12 |
| H | 1,027 | | |
| L | 1,018 | Total | 34,062 |

These words—that is, all words in capitals—were counted twice, and leisurely, so I think the numbers can be relied upon.

In paragraph IV. of the preface to Webster's Unabridged Dictionary, edition of 1873, it is stated that the vocabulary "comprises an aggregate of upwards of 114,000 words." In part explanation of this great difference in the number of words in the two editions, may be quoted the following extract from the preface to the Academic edition: "In the arrangement of words in the dictionary, while a strict alphabetical order is followed, words of the same form, whether etymologically related or not, are not treated in distinct articles, but the definition of one immediately follows that of another in the same paragraph, being separated from it only by a dash. . . . This has been done to save space."

As an example: while "set" in the Academic is printed but once, but defined four times—1st, verb trans.; 2d, verb intrans.; 3d, participial adjective; 4th, noun—in the Unabridged it is given as four distinct words.

—Very respectfully yours,

Chas. E. L. B. Davis,
First Lieutenant of Engineers.

Pass a l'Outre, La., Mouth of the Mississippi, May 7, 1875.

# Notes.

A. WILLIAMS & CO., Boston, publish immediately 'The Names We Bear,' a descriptive compendium of Biblical, classical, and common names; and 'An Open Letter to the Members of the Massachusetts Medical Society' on the true nature of disease, by Dr. E. E. Denniston. They also assume the publication of Mrs. Dall's 'Romance of the Association,' and issue new editions of 'Taxation of Women in Massachusetts,' by William I. Bowditch, and of Sturtevant's 'Dairy Cow.'——D. Van Nostrand warns booksellers against introducing a pirated English reprint of his edition of 'Plattner's Manual of Qualitative and Quantitative Analysis with the Blowpipe.' It has been published in London by Chatto & Windus.——*Old and New* has changed hands again and finally, being absorbed in *Scribner's Monthly*. Mr. Hale's services go with it as a contributor to the latter.——We have received from J. M. Stoddart & Co., Philadelphia, four numbers of their 'Centennial Book of the Signers of the Declaration of Independence.' It consists of numerous lithographic views, portraits, facsimile autographs, etc., and an historical monograph by Wm. Brotherhead, who also furnishes the designs for the shields of the several States. These last are at least a century behind the times, artistically considered, yet have a quaintness which is not unpleasing. The lithography generally seems coarse; the letterpress very good, as is apt to be the case with Philadelphia work.——The eighth annual report of the trustees of the Peabody Museum of American Archæology and Ethnology consists largely of an account of the work done since the death of the lamented Wyman, and the additions to the Museum made since the last report by Mr. F. W. Putnam, the new curator. The Swallow collection of pottery and stone and bone implements, from mounds near New Madrid, Mo., is the most important accession. A number of wood-cuts illustrate the very interesting discussion of these articles.——The Brooklyn *Journal of Education*, of which the second number appeared last month, furnishes abundant reading-matter, but of the mixed quality which, we are sorry to say, we have to expect in similar publications in this country. When shall we see an American educational periodical, not exactly edited by college instructors for college instructors, but challenging the sympathy and support of that class rather than of grammar and primary-school teachers?——The Illinois School and College Association of Natural History will hold a summer meeting for the study of botany and zoölogy at the Museum, Normal, Ill., during the four weeks July 14–August 11. Professors B. G. Wilder, W. S. Barnard, T. J. Burrill, C. Thomas, and S. A. Forbes have been engaged as instructors. Illinois teachers to the number of fifty will be received as students for a nominal tuition fee.——Part 26 of Stieler's Hand-Atlas (New York: L. W. Schmidt) has maps of north-eastern France, the British Isles and adjacent waters, and the western half of Africa north of the Gulf of Guinea. The British map is particularly fine. The fourth supplementary issue of the same Atlas is devoted to three out of nine sheets of a new map of Australia by Dr. A. Petermann.——J. R. Osgood & Co. announce 'The Birds and Seasons of New England,' by Wilson Flagg, illustrated as was the same author's 'Woods and By-Ways of New England.'——'In a Californian Eden,' by Joaquin Miller, and 'Freedom and Fellowship,' by T. W. Higginson, are in the press of Roberts Bros.——F. B. Patterson will publish a compilation consisting of editors' views of journalism, by C. F. Wingate, himself one of the profession in this city.

—We feel compelled to warn our readers against the advertisement of "George Goodwin & Co.," Boston, which appeared in the *Nation* as late as January 14, and which towards the last contained a favorable notice of their enterprise reprinted from our Fine-Arts department. The advertisers promised to send certain copperplate designs by Hans Sebald Beham for a price named. Their advertisement was offered us by a respectable advertising agency, and was inserted before we had seen the engravings in question. When we did see them, we spoke of them as their merits deserved. We have lately had so many complaints from subscribers and readers of the *Nation* who have sent money to "George Goodwin & Co." and received no return or acknowledgment whatever, that we now give the same publicity to this fact that we gave to our opinion of the articles advertised when in our hands and under our inspection.

—A writer in *Home and School*, an educational magazine published in Louisville, has taken a practical way of ascertaining the spread of the Latin pronunciation. "Anxious to test the point, I have blown fifty-odd postal-cards north, south, east, west. From Cape Cod and California, the Lakes and the Gulf of Mexico, they come back with 'ROMAN' upon nearly every one of them. . . . Among the twoscore and ten or more, only two advocates of the English 'straight,' one of these expecting 'to have to accept the Roman as a necessity,' the other smelling the battle afar off, and saying among the trumpets, Ha, ha!" This is all very well as far as it goes, though it seems a little unnecessary to trot in Job's war-horse. But we must not fling our hats in the air yet and hurrah for the millennium. Pronouncing Latin like Gracchus with his piper or like Marcus Tullius himself will not make us a well-trained, classically-educated nation without a thousand other things beside. The very use of the word Roman, which stands in glaring capitals in *Home and School*, shows what a scrappy and superficial thing classical education is in this country yet. It is not quite so bad as the favorite word of ignoramuses, "Continental," but it is bad enough. It is about as absurd as to call English the British language or the London language, or to talk of speaking British or speaking London instead of speaking English. We have looked over the list of places in *Home and School* with some care and interest to see where the Latin pronunciation is adopted. Most of the colleges take to it kindly, except, strange to say, in New England, where only Harvard is named. It is also used in a great many preparatory schools. In general, however, what resistance there is in this country appears to be found in the schools. In England it is just the opposite. While the old use still has its adherents, many of the schools have adopted the Latin; but there is a complaint that the young men are induced to give it up, or at least to suppress it, when they proceed to the universities. It is very conceivable that that typical *Stockphilister*, the old-fashioned English teacher, not dreaming of the progress of the last twenty-five years, should rigidly set his face against a change as a direct aggression on the Church and the throne. But the cause has little to fear there with such champions in the van as Munro and Roby and the Ellises twain—Alexander and Robinson, the two Ajaxes of Phonetic Reform, we should be tempted to call them, except that neither can be called the Less.

—The testimonial vase for Mr. Bryant is now being made by Tiffany & Co. This tribute, the plan for which originated in the Century Club, will be in repoussé silver, thirty inches high. What is singular is that Mr. Bryant will but have a life-interest in the vase, which, after having comforted him so far as it is capable until he dies, will become at his decease a deposit in the Metropolitan Museum. The last number of the *Art Journal* (D. Appleton & Co.) contains fine engravings by Filmer of the accepted design, together with the rejected ones prepared by Mr. Pairpoint for the Gorham Company, by Mr. Osborne for the Whiting Company, by Messrs. Starr & Marcus and Messrs. Black, Starr & Frost. The design from Tiffany's is in very good harmony with the poet's works, being correct, guarded, and safe, but differs from them in not showing the least touch of inspiration. It is a formal composition, of American native growths gathered into a general Greek outline, under whose government are grouped the waterfowl, the bobolink, the cotton-plant, apple-blossom, and gentian, with medallions indicating the most important stations in the poet's and editor's career. As a piece of hammered work, it is intended to be careful and finished in the extreme, and the repoussé relief will be as high as the silver can be made to bear. But it is only necessary to see the design to perceive that art-manufacture, and not plastic art, has been the inspiring afflatus. The other designs are all more ambitious, and all works of real sculpture, as it would appear; there is not one of them that would not have been ornamental and effective. A suspicious look about most of the accessory figures, however, as if they had strayed out of Neo-Grec museums made up from the ruins of Pompeii and Herculaneum, or out of the frescoes of Renaissance artists, condemns them. That sent in by Starr & Marcus is certainly a spirited and striking composition. That by the Gorham Company, if carried out, would have been four feet high, and the makers would have troubled the subscribers for but a small part of the cost.

—There are several articles which make the *International Review* for May worth buying and reading: "The Practical Work of Painting"; Major-General Upton's "Prussian Company Column"; Mr. E. A. Freeman's "Difficulties of Republicanism in Europe," etc. We single out Prof. Newcomb's paper on "Life Insurance" for a number of reasons: it is clearly and strongly written, it is above suspicion of being anything but a purely mathematical and disinterested view of the subject, and it will naturally be read by almost every one who takes up the *Review*. Prof. Newcomb aims to show the injustice of the "absolute and indiscriminate forfeiture" of "rights worth a thousand dollars, beyond all hope of recovery, for a failure to pay ten"; and that even the Massachusetts non-forfeiture law, though an important and salutary step in the right direction, "does not completely satisfy the demands of equity." He also—in view of the fact that "the average annual expenses of all the larger companies in the country generally amount to nearly or quite 20 per cent. of the entire premiums

received, and, in some years, actually exceed the amount paid out for losses by death"—asserts his belief that these expenses can be greatly reduced, and that the costly instrumentality of agents can be wholly dispensed with. We cannot undertake to abridge his argument, nor is it for us to criticise it as a whole. We think we see, however, a number of statements and conclusions which the insurance companies will contest vigorously, as is their wont. We venture a single remark on Prof. Newcomb's plan to substitute for paid agents, working on commission, "a body of agents far more numerous and effective," whose services may be had gratuitously, viz., the company's own members. When he goes on to add that the great "advantage of members themselves as soliciting agents may be judged by the simple reflection that if each of the present members of the larger companies should, on the average, bring in one new recruit in five years, the growth of the company would be sufficient to satisfy the most ambitious," we cannot restrain a smile. For a hundred years, more or less, newspaper editors have been saying the same thing to their readers; but just because they keep on saying it, we infer that the returns do not equal their reasonable expectations. Among the most attached subscribers, the number of those who actively and without hope of discount or other reward help to extend a paper's circulation is extremely small. We suggest, without discussing, the question whether the competition of insurance companies would ever permit such an experiment to be tried; and we will express our fears that, if it were, the public would suffer more from the misrepresentation of philanthropic solicitors, ignorant of the principles of life insurance and incapable of discriminating between the pretensions of rival companies, than it now does from the workings of the present system, which assuredly, on the score of economy, is not more to the minds of the companies than it is to Prof. Newcomb himself.

—A writer in the Milan *Perseveranza* undertakes to show that the idea so successfully carried out in Capt. Boyton's swimming-suit is at least two centuries old. He has found in a rare French dictionary compiled by one Richelet, and printed by Widerhold at Geneva in 1680, in two quarto volumes, the word *Lanquerre*. This was derived from a certain Richard Lanquerre of Amiens, *gentilhomme*, who in 1677, after protracted experiments, invented an impermeable habit (*scafandro*) like Boyton's, by means of which one could keep up a long time in the water, with the privilege of moving his limbs at pleasure. An extremely rare book by the same person was published in Paris in 1675, under the title: 'Le naufrage sans péril, ou Invention d'une machine qui nous fait passer les rivières *tous vestus*, et *estre plusieurs jours sur la mer*, sans aucun péril pour notre vie et sans mouiller nos armes ni nos habits, etc.' A hundred years later another inventor, De la Chapelle, came out with his 'Traité de la construction théorique et pratique du scaphandre, ou de l'*homme-bateau*, ou du bateau de l'homme, etc.' (Paris, 1775), which is mentioned in the Secret Memoirs of the time. In the absence of drawings, it would be impossible to guess the degree of resemblance between these earlier contrivances and Boyton's, but the term *homme-bateau*, or man-boat, applies very well to the American invention. It now remains to be seen whether another century will not pass before the swimming-suit is heard of again. Capt. Boyton's deep-water performances, however admirable, will not of themselves save it from disuse and oblivion; nor will anything, we fear, unless it is capable of being substituted on a large scale for the present inadequate life-preserver. Are ocean steamers likely to provide them even for first-cabin passengers? We cannot judge. One "man-boat" at least might be carried for the exclusive use of the captain. Discipline and honor require that he should be the last to leave his sinking ship; the odds are therefore against his surviving such a catastrophe. Would it be unwise or unfair, as it would be humane, to change the odds to the other side?

—With No. 55, the Berlin Geographical Society's *Zeitschrift* enters upon its tenth volume. The present contents deal mainly with African topics. Under the head of Egypt we are sorry to read of the very low condition of Dr. Nachtigal's health, which is doubtless aggravated by his poverty. He maintained himself in his remarkable exploration of Northern Central Africa only by borrowing money at extortionate rates, and the Government aid he has since received has barely enabled him to pay his debts. His means of future support are therefore entirely precarious. The *Zeitschrift* appeals to the generosity of his countrymen not to neglect one of the most distinguished and meritorious explorers of modern times. The map of this number illustrates the expedition of Emil Odebrecht up the river Itajahy Assú in the province of Santa Catharina, Brazil, near whose mouth is the interesting German Blumenau Colony. In No. 1 (Vol. 2) of the same Society's *Verhandlungen* is a paper by Baron Richthofen in support of the native estimate of the population of China. We may return to this subject again. Among the news items is one of the formation of a new society in Vienna called the Oriental Museum, which has a permanent public exhibition in the Windischgrätz Palace, issues an *Austrian Monthly* "für den Orient," and is zealously devoting itself to scientific and practical acquaintance with the East. The membership is already very large. The *Tijdschrift* of the Geographical Society of Amsterdam shows marked improvement in its fifth number, in which for the first time a systematic attempt is made to note the progress of geographical science in all parts of the world. The most recent journeys in and through Mongolia form the subject of an article which is accompanied by a useful map, and there is another of the island of Flores. In No. 3 of this journal Prof. Veth concluded his survey of the additions to our knowledge of the globe during the year 1873. Speaking of the United States, he said: "American railways excite in us such unpleasant reminiscences that on this topic I shall be permitted to touch but gingerly." He was doubtless addressing some of the Dutch capitalists who are now engaged in patching up a settlement with the St. Paul and Pacific. What a pity he had not at his elbow those jolly Hollanders whom Senator Morton reported so eager to build the double-track, broad-gauge, air-line, steel railway across the continent.

—At the Winckelmann festival of the German Archæological Society in Rome, last December, one of the secretaries, Prof. Helbig, lectured on the bronze razor of very ancient times. Alluding to the absence of such instruments in the older portion of the necropolis of Alba Longa, he declared, as reported in the Augsburg *Allgemeine Zeitung*, that this shows our Indo-European ancestors to have been razorless, however much civilization they can be decked out with in other respects. This view has seemed so unsatisfactory to Benfey, that in a recent meeting of the Anthropological Society of Göttingen, he came to the rescue of our prehistoric relatives. He said a re-examination of the evidence had not led him to change his opinion as to the razor among the Indo-Europeans. The evidence in such matters, it will be remembered, is linguistic; the presence of a common word in many languages of the family leads to the inference that the thing was known before the separation occurred, and the presence of a common word in very few of these languages leads to similar interesting inferences, which must, however, be very cautiously made. Benfey dwelt upon the resemblance of the Sanskrit kshurás. and the Greek ξυρός, and declared the evidence of these independent words to be conclusive. The presence of Sanskrit words for sheep, wool, and weaving implies the knowledge of some instrument for cutting hair, so that the discovery of an instrument which should torture their descendants to the latest generations involved nothing remarkable, even if one do not assume the presence of more civilized neighbors. That no razors have come down to us from the Prisci Latini proves nothing. It may be merely accidental that none has been preserved to excite our curiosity, or this people may have given up their use during their wanderings, before Italy was reached. There is plenty of evidence of important changes which happened during the wanderings of the different branches of the Indo-European family. Thus, the original family was familiar with gold and silver, and had a numerical system in which even various thousands were distinguished, but the Romans had lost the habit of counting thousands, as had indeed most of the branches of the family, and were obliged to find a new word; the Greeks and Romans lost during their travels the original word for gold, as the Germanic and Slavonic branches lost that for silver, and were forced to find a new word when they came to know the forgotten metal again.

—The extent to which Boccaccio has been imitated is surprising, and this imitation has been made the subject of an excellent monograph by Dr. Marcus Landau, entitled 'Beiträge zur Geschichte der Italienischen Novelle' (Vienna, 1875). A proof of Boccaccio's immense popularity is found in the fact that Dr. Landau's work, although intended merely to notice his imitators, has grown into a tolerably complete history of the Italian novel, with notices of Chaucer, the 'Cent Nouvelles Nouvelles,' Marguerite of Navarre, Dryden, and Lafontaine. Boccaccio in turn was himself only an imitator. He drew on the popular stories of the day, some of which were of Oriental origin, others relics of classic days; he used actual events, and levied his contributions on countries which later reversed matters and owe to him some of their most charming narratives. We believe there are only twenty of the hundred novels of the Decamerone the origin of which is unknown, and which, we may therefore presume, were the inventions of the author's brain. The subject of the sources of the Decamerone has been pleasantly and clearly treated, likewise by Dr. Landau, in a work entitled 'Die Quellen des Decamerone' (Vienna, 1869), which will be found of value for the history of mediæval fiction and its Oriental originals.

—There are some countries where Latin is still used for other purposes than college diplomas and physicians' prescriptions. The librarians of the Laurenzian and Imperial Libraries at Florence and St. Petersburg have lately exchanged compliments in Latin epistles, in which there is of course much mention of "urbs Florens, nomine et omen habens—Florentia pulchra—Pieridum Ausoniae," on one side, and on the other, "Haec Catharina fuit Juno, Venus, atque Minerva—sideris Arctoi," etc. A deeper tinge of the Renaissance will be found in the Latin distichs which Prince Giuseppe De Spuches, the distinguished poet and archæologist of Palermo, addressed to Count Giuseppe Rossi in return for the latter's condolences on the occasion of his daughter's death, and which we take from the March number of the *Rivista Europea:*

"Dum mea tabescunt crudeli pectora luctu,
Quis me dignatur carmine dulcis olor?
Rossius est, Orpheu cui fas aequare canendo,
At cur non itidem flectere fata potest?
Si quiret . . . dempta, o mea Lux, mea blandula nata,
Esses semineci mox reditura patri!"

## SCHLIEMANN'S TROY.*

TWO years ago, we suppose that the majority of English and American scholars would have acquiesced in Mr. Grote's words as to Troy and the Trojan War—that "as the possibility of it cannot be denied, so neither can the reality of it be affirmed." Let us see whether this judgment has been materially changed by Dr. Schliemann's discoveries. He is admitted by all to have found remains of great antiquity and interest: are they those of the Homeric Troy? The question resolves itself into two questions: Is the hill of Hissarlik the spot which the writer of the Iliad had in mind? and, granting this, Does it follow that there really existed on this spot a city called Troy (or Ilium), the seat of a powerful empire, captured after a long siege and burnt by the Greeks?

As regards the first point, we do not see that much need be added to Mr. Grote's own words. All the arguments against the site of Hissarlik rest upon the assumption that we are to look at the Iliad as if it were an historical document, and require the locality to correspond as closely to its descriptions as is the case with those of Herodotus and Thucydides—a test which would fail as sadly in the case, for instance, of an historical romance like 'Anne of Geierstein,' written with full access to documents and in the full light of modern criticism. The ancients, it is admitted, down to the third century B.C., unanimously placed Troy on the site of the historical Ilium; and if this passed muster with the community generally, we cannot suppose the author, or authors, to have been more critical. Indeed, Dr. Schliemann seems to have disposed of the chief objection, that of the course of the Scamander, by showing the probability of its having changed its bed; he has found springs which answer to the description of the poet quite as well as those of Burnabashi; and as to the mathematical arguments, from the size of the plain and the distance of Hissarlik from the shore, if they did not trouble Alexander the Great and Lysimachus, we think they need not trouble us.

This is the line of argument that convinced Mr. Grote, and its force has certainly not been diminished since Dr. Schliemann's discoveries. In considering the second question—whether the ruins found by Dr. Schliemann are those of an historical Ilium which was the basis of the legendary Iliad—we must premise that his excavations have *proved* nothing on this head; all arguments built upon them have solely the force of creating or strengthening probabilities. What is needed is inscriptions; barely two or three, which have been shown to be in the Cypriot alphabet, and which are believed to be in a dialect of Greek, make up the whole amount. If scholars succeed in deciphering them, it may determine the question; at present they give us no light, and the other monuments are far from affording any absolute evidence, one way or another. Apart from these discoveries, the argument stands thus: our sole evidence of the existence of an historical Troy is derived from the Homeric poems, supported by the unanimous belief of antiquity. Now, it is certain that, according to the present canons of evidence, this cannot be received as proof; so far, all will agree with Mr. Grote. But it will be observed that Mr. Grote allows no middle ground between "possibility" and "reality"; he refuses to tread upon the treacherous ground of "probability." This is in the main a matter of temperament. Mr. Grote's positive and sceptical nature found no satisfaction except in definite belief or non-belief; for ourselves, we have always felt more sympathy with Curtius's point of view. A real Ilium, a real siege and destruction, have always appeared to us not certain, but probable. As M. Lenormant puts it (*Academy*, March 21, 1874): "Perhaps there is not in the sublime songs which bear Homer's name one single word more of positive history than in the rude and grandiose 'Geste de Théroulde,' but we should no more have the 'Iliad' if there had been no siege and no destruction of Troy by the Greeks, than we should have the 'Chanson de Roland' if that disaster had not happened to Charlemagne's rearguard in the Pyrenees."

We start here with an antecedent probability of the existence of Troy and its destruction, and this probability is enhanced by the Egyptian monuments, which appear to speak of Dardanians and afterwards Teucrians of Iluna as a powerful nation of Asia Minor in the period assigned by tradition for the Trojan empire. M. Lenormant gives this as an undisputed fact; but as another eminent scholar, Mr. Sayce (*Academy*, May 30, 1874), questions the reading of the Egyptian monuments, we are only entitled to set it down as enhancing the probability, not as turning it into a certainty. Now, this original probability that the Homeric poems relate dimly to a real event, thus strengthened by arguments from Egyptian documents, is, we cannot but think, still further strengthened by Dr. Schliemann's discoveries. Here, upon the spot which the ancients believed to have been the scene of the Homeric poems, and where we have found good reason to believe that a great city really existed and was destroyed by fire in very early times, Dr. Schliemann has proved that a city of considerable wealth and extent and of enormous antiquity actually did exist and was destroyed by fire. He has not proved that this city was called Troy, but this lack of a name is the only link wanting in the chain of evidence.

It must be said that there are two real difficulties in the way: first, the small extent of the plateau of Hissarlik, which would be large enough for an acropolis, but which appears to have contained the entire city; second, the objection made by M. Lenormant that the remains are too archaic, and display too low a stage of civilization for the Troy of the twelfth century B.C. But does he not really mean, not the Troy of history, but the Troy of Homer? Is he not ascribing to this distant age the more advanced civilization of the age of its poet? Of course Homer depicts the manners and institutions of his own time, transferring them to the distant period of which he wrote, just as Shakspere transfers the usages and ceremonies of the reign of Elizabeth to that of the early Scotch king Macbeth. Archaism of manner does not prove any absolute date, but only a relative antiquity, just as it is notorious that the Stone, Bronze, and Iron ages exist contemporaneously. Again, what is true of the culture is true of the size of the city. We take our notions from the descriptions of Homer, and apply them to a city which, in his day, had long perished. We must say that we find further strengthening of the probability in the owl-faced figures. Mr. Sayce (*Academy*, Mar. 7, 1874) says that these are "nothing more than the rude attempt of early art to delineate the human face." We cannot agree with him; it seems to us that the owl-face would strike any person who should see it casually, and that Dr. Schliemann's interpretation of γλαυκῶπις is very felicitous. Taken in connection with the contemporary art of Egypt and Assyria—the ram-headed Ammon and the man-headed bull—it belongs to a stage of religious development which was but little beyond the fetich: the deity immanent in the sacred owl, then the owl's head put upon a human body. At a later stage, the owl became a mere emblem or accompaniment of the goddess, but we have no question that all the sacred animals of the Greeks are remnants of an outgrown fetichism. Prof. Max Müller, to be sure (*Academy*, Jan. 10, 1874), asserts that "whatever goddess may be assigned to the Trojans in the Homeric poems, the real deities of that country were not Zeus or Athene, but the Kabeiroi, the Idæan Daktyloi, and the Mother of the Gods." But surely it is not incredible that the people of this city had their special owl-headed goddess besides the group of deities worshipped in the region. At any rate, if Homer proves anything, he proves a peculiar importance of the worship of Athene in Ilium. We believe then that Dr. Schliemann has made out a very strong case in favor of his pretensions to have found the remains of Troy upon the hill of Hissarlik. But when we say Troy, we mean not the Troy that Homer described, but the Troy that actually existed, and which Homer knew only by tradition. When Dr. Schliemann goes further, and attempts to identify the Scæan Gate, the palace of Priam, and the treasures of Priam, we no longer credit him with *probability*, but fall back upon the safe ground of *possibility*.

The volume is published in sumptuous style, is full of plans and illustrations, and is provided with a good index.

* 'Troy and its Remains: a Narrative of Researches and Discoveries made on the Site of Ilium and in the Trojan Plain. By Dr. Henry Schliemann. Translated with the author's sanction. Edited by Philip Smith, B.A. author of 'The History of the Ancient World' and of the 'Student's Ancient History of the East.' With map, plans, views, and cuts, representing five hundred objects of antiquity discovered on the site.' London: John Murray; New York: Scribner, Welford & Armstrong. 1875. 8vo, pp. 392.

## MOHAMMED AND MOHAMMEDANISM.*

THE origin and development of a religious system which rapidly became the ruling religion of millions of men, which has very extensively influenced the political and spiritual history of mankind, and which with great tenacity still maintains itself after twelve centuries, and is a living power amongst numerous nations, are certainly a phenomenon on the study of which too much learning and ingenuity cannot be bestowed. If in Asia and Africa forty generations, and countless thousands at the present day, have renounced fetichism and have shouted and still shout enthusiastically, *Allahu Akbar*—God is great—to what is the world indebted if not to the redeeming power of Mohammedanism? Mr. Smith has attempted to give within the bounds of four lectures a short yet complete exposition of the main points in the history of the rise of this religion and of its chief characteristics. It is true, as the author confesses in his preface, that his work has been mainly derived from secondary sources, from the study of books in the European languages, and that he has drawn but little directly from the fountain-head—from the Koran and other old Arabic writings. To a certain extent, he has succeeded in his attempt. The historical material has been carefully studied and sifted, and the points have been placed in their proper light or proper shadow; judgment on the life and character of the Arabian prophet has been rendered with considerable psychological insight; and (what deserves particular acknowledgment) the author has written as a fair and impartial critic who divests himself as much as possible of prejudices and foregone conclusions. For not only in past ages has Mohammed been designated by partisans as "the false prophet," "a wicked impostor," "a devil incarnate," "the little horn" of which Daniel prophesied, etc., etc. Even in our time most of those who approach the subject do so in a polemical spirit, and are incapable of expressing an impartial and unbiassed opinion.

The title of this book leads one to expect that Islamism will be exhibited in its essence as well as in its historical development. But such is not the case. Whoever looks to it for an exposition of the Mohammedan conception of the Godhead, or of prophecy, or of the Mohammedan idea of state and government, or for information in regard to the great dogmatic and ritualistic differences between the confessors of Islam in Constantinople and Smyrna on the one hand, and those of Teheran and Delhi on the other—between Soonnees and Sheeahs—will seek in vain. Still more will he be disappointed who reads these lectures in the hope of becoming familiar with Islamism in its historical aspects. If a cultivated Persian should desire to get acquainted with Christianity, it would certainly not be sufficient for him to read the Bible alone. The Bible is the foundation only, while historical Christianity is the superstructure. Just so it is with Islam. This system, in its rise, its progress, and its decadence, cannot be understood by the Koran alone. Here, too, we have to distinguish between foundation and superstructure, to examine the various historical periods—the patriarchal period, the period of the Caliphate, and the period of the Sultanate—to consider what particular changes Mohammedanism underwent in the Arabic, the Arabico-Persian, and the Persian-Turkish epochs, and what particular forms it assumed under the rule of the Abbasides in Asia and of the Ommyïades in Damascus and in Spain, and so forth.

Besides these faults of omission, we must point out some of the statements and conclusions of Mr. Smith with which we are unable to agree. He seems in his endeavor to be fair and impartial to have painted the character of Mohammed in too favorable a light, at least so far as it manifested itself after his flight from Mecca. As to the period before the hegira, we are in full accord with Mr. Smith's views concerning the Prophet's sincerity and honesty. In the earlier half of his life, Mohammed does not appear like a man who wilfully lies and deceives. His eminent biographer, Mr. Sprenger, is too severe and too one-sided in his judgment of the character of "the epileptic Prophet" (as he calls him), at least when he refers to his sayings and doings while in Mecca. He is more justified in his verdict on the later life of Mohammed—although here too we must abate something—when he says that the Prophet, after he had attained power in Medina, was nothing more than "ein wollüstiger Theokrat, ein blutdürstiger Tyrann, ein Pabst und König" (a lustful theocrat, a bloodthirsty tyrant, a pope and king). This language is too harsh, and implies an unjust undervaluation of a character which retained much of its moral greatness even amid the temptations of success and of a vast popularity. But there cannot be the least doubt that Mohammed experienced a great change after the hegira. Mr. Smith, however, errs more than Mr. Sprenger did when he undertakes to whitewash unduly the later acts and words of Mohammed. His is a strained apology, a forced justification, and not much better than the so-called *Rettungen* which German historians have attempted.

On page 43, we find the substance of a sermon by Mohammed on charity (preserved by an early Arabic author), in proof of the sublime ethical views and precepts of the founder of Islam. The sublimity of a very large part of his moral teachings cannot be denied. As to this particular instance, however, Mr. Smith was not aware that Mohammed almost literally repeated the sermon of a Jewish rabbi delivered several centuries previously. In support of this assertion, we need but refer to the Talmud, *Baba Bathra*, fol. 10, *a*. The sermon is indeed one proof of the fact, which is now generally admitted, that Judaism is one of the main component elements of Islam. What Mr. Smith says concerning fatalism is generally correct. Some peculiarities in the character of the Orientals should rather be ascribed to climatic and other influences than to theological views and principles. In the theology of the Koran and the Soonna, the doctrine of fatalism has no more support than it has in our orthodox Christian theology. The free-will theories of Pelagius and Arminius did not prevail, but were condemned as heresies by the orthodox church, while the dogma of predestination (another name for fatalism) as taught by Augustine and Calvin took deep root in the Christian system of belief. So Buckle, and historians and philosophers of his manner of thinking, must be classed with the fatalists even more decidedly than the Moslems of the East. As to the propagation of Islam by fire and sword, it must be conceded that this is in accordance with the practice and precepts of the Prophet, and that in this respect Mohammedanism is in diametrical opposition to the teachings of the founder of the Christian religion. But, historically speaking, the contrast between the practice of Christians and Mohammedans has not been so sharp as is generally supposed. This is well illustrated by Mr. Smith.

This work, then, will not meet the wants of the student who desires a thorough acquaintance with the subject; but the general reader, who does not ask to have every point verified by reference to the first sources, and who does not care to enter extensively into the minutiæ of the history, will find these lectures very acceptable and instructive, all the more because the American publishers have added as an appendix Emanuel Deutsch's brilliant essay on "Islam."

* 'Mohammed and Mohammedanism: Lectures delivered at the Royal Institution of Great Britain in February and March, 1874. By R. Bosworth Smith. With an Appendix, containing Emanuel Deutsch's Article on "Islam."' New York: Harper & Brothers. 1875.

## RECENT WORKS ON ASTRONOMY.*

LIEUTENANT-COLONEL DRAYSON'S book belongs to a class which is of more interest to the psychologist than to the astronomer. A writer of more or less intelligence concerning subjects of everyday life conceives an intense hatred against some astronomical fact or theory, and spends all his energy, and perhaps a great deal of money, in violent assaults upon it. Commonly, it is the theory of gravitation which produces this extraordinary cerebral excitement, but in a recent well-known case in England it was the rotundity of the earth. In our author's case it is something which, we should suppose, would never trouble any one but a profound astronomer—namely, the motion of the pole of the earth; or, rather, the slow change in the direction of the earth's axis which is known to be continually occurring. This change was detected by Hipparchus before the Christian era, and its cause was pointed out by Newton, who showed it to be due to the attraction of the sun and moon on the slight excess of matter at the earth's equator. The cause once known, the effect admits of exact calculation, only, not knowing exactly how the matter composing the earth is distributed in its interior, there is an uncertainty: the exact amount of the motion cannot be computed from theory. But its direction and law of change admit of accurate calculation, while its amount can be determined from observation; so that by combining theory and observation all the circumstances of the motion are determined with great precision, and are laid down in all works on theoretical astronomy.

Instead of studying the subject in these works, Mr. Drayson refers to popular writings of Herschel, Airy, and others, where he finds it stated that the pole of the earth revolves in a circle, round the pole of the ecliptic as a centre, once in 26,000 years. Now, as the latter pole itself changes its position slightly, he wants to know how it can do so and still remain the centre of the circle. Irritated by such a geometrical absurdity, he makes sarcastic flings at it throughout his book, and, indeed, we believe this is

* 'The Cause of the Supposed Proper Motion of the Fixed Stars, and an Explanation of the Apparent Acceleration of the Moon's Mean Motion, with other Geometrical Problems in Astronomy hitherto unsolved. By Lieut.-Col. Drayson, R.A., F.R.A.S.' London, 1874.

'Astronomy. By J. Rambosson, Laureate of the Institute of France (Académie Française and Académie des Sciences). Translated by C. B. Pitman.' London, 1875.

'Outlines of Astronomy. By Arthur Searle, A.M., Assistant at Harvard College Observatory.' Boston: Ginn Brothers.

the second book he has devoted to its refutation. Of course, he gets up a pet theory of his own, which he attempts to prove by observation, and that is, that the pole describes a circle round another centre. It is characteristic and amusing to see him using nautical-almanac data, computed by the astronomers from their own theory, as observations on which to base his conclusions.

The explanation of the whole difficulty is that the actual motion, though it admits of precise definition, is too complicated to be made fully clear to a non-mathematical reader. But it comes so near a circle round the average position of the pole of the ecliptic that a sufficient idea of it can thus be given to one who only wishes to understand its general nature, and hence it is so described in popular works. A similar mistake is made when it is said that the earth is spherical in form, and a case quite parallel to the present would be that of a writer who, finding this statement in an astronomical work, and knowing that the earth was flattened at the poles, should write several books to prove the absurdity of supposing a sphere several miles shorter in one diameter than in another.

Whether viewed from a grammatical, rhetorical, or scientific point of view, Rambosson's work is about the worst we remember to have seen. The author, translator, and proof-reader must all have been careless and indifferent in the extreme. There is hardly a chapter without inaccurate statements or unintelligible sentences, and hardly a page that is not open to criticism on some score. Not to deal unfairly, by giving single detached statements as specimens, we quote in full the description of the long polar night-winter :

"In mid-winter, the only substitute for the sun is a faint twilight, emanating from the reflection of the rays which it lets fall upon the lofty mountains and the thick mists that compose the atmosphere of the glacial zone.

"The nights are never so dark at the poles as in other regions, for the moon and the stars seem to possess twice as much light and scintillation, while their rays, reflected by the snow and ice with which the ground is covered, shed so bright a glow that one can see one's way, or even read, without the aid of a candle.

"During the sun's disappearance, the moon is nearly always effulgent in these regions, and, in addition to it, there is a continuous light in the north, the varied shade sand play of which are among the strangest phenomena of nature."

A critical reader might ask such questions as why are those lofty mountains not described more fully by travellers? To receive the sun's rays they must be sixty miles high. How could the extraordinary brilliancy described in the second sentence occur in an atmosphere composed of thick mists (not to say lofty mountains)? What is the strange light described at the close—is it the aurora? As a matter of fact, the moon is above the horizon only half the time during the polar night, so that she cannot be "nearly always effulgent." How such a production as this could have found its way into print we are unable to explain.

We have seldom seen a book whose name and preface more truly and modestly characterized it than the 'Outlines of Astronomy.' It is full without being heavy, precise without being pedantic, and explanatory without being diffuse. It nowhere disappoints, and least of all by any enthusiastic ascribing of pre-eminence to its own subject-matter. Concerning the study of astronomy in schools the preface says :

"The knowledge of any natural science, obtained only from a text-book, is scarcely valuable enough to warrant the consumption of much time in committing the book to memory, although its statements may be made with all the precision attainable by the use of mathematics. The student may derive from it some real knowledge of mathematics, but little or none of the science which he has professedly been studying. . . . For most students, then, the study of astronomy merely means the acquisition of such an amount of general information about that science as may serve to add to the rational interests and pleasures of their lives. The present work is accordingly intended rather to be read than to be learned by heart."

We would gladly quote more from this sensible preface, did space permit. As regards the body of the work we have not detected an error of statement in any part of it, which is a good deal to say, or would be of any author but an astronomer. That a parabola is defined as "an ellipse so eccentric that its length is *out of all proportion* to its width," and "as none of the numerous comets moving in parabolas or hyperbolas *are likely* (!) to have been seen before," we may consider evidences of a desire to avoid excessive precision rather than as errors. Of theorizing there is beautifully little, though that little is occasionally faulty. For instance, a doubtful hypothesis concerning the origin of the trade-winds is assumed as fact ; and in discussing the influence of the moon upon the earth's climate an apparent slip is committed. It has been said of the stars : "The heat we receive from them is in many cases enough to be measured ; and it is likely that, if no heat came to us except from the sun, the temperature of the earth *would be much lower than it is*. . . . The heat reaching us from a bright star is more easily perceived and measured than the very small amount which we receive from the moon." Whereas of the moon the author says : "The chief effect of the heat sent out by the moon towards the earth is to clear off clouds in the earth's atmosphere. . . . When it takes place, the rocks and soil of the earth can send out their heat without having it reflected back to them by the clouds, and so grow cooler rather more quickly than they do on cloudy nights. Hence the heat sent us by the moon is *more apt to make us cool than to warm us*." Why, we might ask Mr. Searle, does the heat of the moon cool us, while the heat of the stars warms us ? and why would not the earth's heat melt the clouds which imprison it, just as quickly as heat coming down from the moon ? and why, in fine, should an access of heat from any source produce a loss ? There seems a little lack of scepticism or of good sense in stating, without any attempt at defence, a doctrine so almost paradoxical.

To the most common and idle topics of astronomical speculation, such as that of the inhabitants of other worlds, Mr. Searle devotes only three pages, whose curtness and sense make them well worth quoting entire. But we can only add here a single description, to show the style of the work :

"There are certainly millions of little solid bodies moving about in our own part of the universe. These little bodies are often of irregular form, like the stones and dust of the earth ; and they are so plenty that, if we had not the air to keep them off, they would make the earth a very unsafe place for us. As it is, they sometimes force their way through the air and fall to the ground, although the air is a much more effective defence against these *aerolites*, as they are called, than would at first be supposed. For, a body moving many miles a second, through even the thinnest air, is very soon burned up if it can be set on fire ; and if not, then crumbled to dust by the heat produced in it by the resistance of the air to its progress."

The clearest and most interesting part of the book is its description of the sun. The final chapter, "Notes," contains some new features ; for instance, a list of evenings in 1874–5 when the variable star Algol is changing. On the whole, we heartily recommend this as the most readable treatise upon astronomy that we have ever seen.

---

*Spain.* Art Remains and Art Realities : Painters, Priests, and Princes, etc. By H. Willis Baxley, M.D. (New York : D. Appleton & Co. 1875.)—The remark one first feels obliged to make about this singular book is that it is, after all, not so bad as it seems. We confess that we had left it lying on our table for many weeks, with no expectation of ever bestowing a second glance upon it. The first had been sufficient ; it seemed to us that the presumption was wholly against a couple of stout volumes written in a style so bristling with barbarisms. But we were recommended to take it up again, and we have been, to a certain extent, fairly thankful for the advice. Dr. Baxley puts his worst foot foremost and does himself elaborate injustice. His book is, in form and manner, as we have said, simply barbarous. If Mr. Matthew Arnold could be put into possession of it, we are sure he would consider it of great value to his famous plea in behalf of the literary influence of academies. The matter of Dr. Baxley's shapeless and ponderous production is not of the first merit, but it is quite good enough to be better presented. It is hard to imagine how a man of so much general vivacity of mind, and who appears to have read and observed to such good purpose, should have remained so exempt from the civilizing influences of culture. He lately spent three years in Spain, apparently for his health, and he seems to have kept copious journals and memoranda of his travels and observations. These he has worked over into a narrative of the most intolerable clumsiness and diffuseness, shovelling into it as he goes interminable digressions and disquisitions on everything that comes into his head, especially on what he calls "religionism." Though he is an inveterate theologian and confronts us with Scripture texts at every turn, the venerable word religion seems unknown to him, and to the best of our knowledge the adjective belonging to it never once occurs throughout the work. Its place is invariably occupied by the singular term "religionist." His digressions are in all cases very tedious and in extremely bad taste, and his reflections on Spanish social phenomena of all kinds are evidently founded on very superficial observation. But as regards architecture and painting he is much more satisfactory, and he offers us a good deal of interesting information as to churches and museums. Architecture is his strong point ; here he apparently knows and discriminates. As regards painting, he has more zeal than knowledge, but he pleads the cause of Murillo with almost fanatical ardor, and treats us, catalogue in hand, to interminable descriptions of his innumerable pictures. To Velasquez he is much less liberal, and a critic who fails to recognize this great painter's magic can hardly be

considered trustworthy. He falls foul of Mr. Ruskin, whom one is sorry to see attacked save by thoroughly competent persons. Dr. Baxley has much to say about Spanish climates, and in this particular we imagine his remarks are judicious and valuable. He seems to think that the absence of indoor comfort quite defeats the advantages of a mild winter temperature. But this is an old story. In spite of his diffuseness, his dogmatism, his theology in season and out, his pretentious, tumid style, Dr. Baxley wins our esteem by a certain manly frankness and by having in all cases the courage of his opinions. His book contains a good deal of information which many travellers would doubtless find acceptable; but in its present form this is absolutely unavailable, and no traveller would dream of carrying about such a ponderous mass of grossly irrelevant matter for the sake of a moderate dose of fair guidance. We are afraid that the author will have an opportunity to meditate upon the fatal consequences of producing misshapen books; but if through any rare chance he should some day put forth a second edition, let him compress it into a single volume, strike out all the theology, half the history, and a good third of what he calls the "art realities." After this an occasional tourist with a large literary appetite and a robust palate may find his work of some use. As it stands, it seems to us of almost none.

---

*Elementary Lessons in Historical English Grammar*, containing Accidence and Word-formation. *Literature Primers: English Grammar.* By the Rev. Richard Morris, LL.D. (London and New York: Macmillan & Co. 1875.)—Dr. Morris's 'Elementary Lessons in English Grammar' has a very modest title. It goes fairly over the whole matter of inflection and derivation in a manner well suited to advanced classes in our high-schools, and really contains in its 250 pages the marrow of his 'Historical Outlines of English Accidence,' and somewhat more. It is no abridgment, however. He has rewritten it and gathered new illustrations, so that it has all the freshness and completeness of a new work. It is everywhere clear, accurate, and methodical, and exhibits great wealth of illustrative examples, and tact in the selection and arrangement of them; so that altogether it leaves little to be desired for a text-book of the kind.

If it has a weak point, it is phonology. Some matters of this kind are overlabored—Grimm's law, for example. There are three sets of letters, surd, sonant, and aspirate—or, as Dr. Morris calls them, little graphically, aspirates, flats, and sharps. The law is, that surds change to aspirates, aspirates to sonants, sonants to surds. There is no criss-cross movement, no "swapping," since, while causes are operating to change all *b*'s into *p*'s, the *p*'s cannot get to be *b*'s; and if this be once noticed, it is impossible to mistake and hard to forget any part of the law. But Dr. Morris has pages of tables and statements and mnemonic catch-words, until one begins to get confused about the whole matter.

In his classification of the strong verbs, he makes his first division to consist of verbs in which we can trace the past tense in an earlier reduplicated form—a wholly unscientific and unsteady principle of division, since all the forms come from earlier reduplicated ones, and whether we can trace them or not is a matter of individual skill. As a matter of fact, no attempt is made here by Dr. Morris to trace them. He does not even make a division of those which are found with the reduplication in Gothic or other Teutonic tongues, but follows the lists of Rask, perhaps, or some other old grammarian, and dismembers the class of verbs having roots in *a* between his two divisions, on no obvious ground unless it may be the superficial euphonic variations. In the history of the ending of verbs in the second person singular, § 202, inaccuracies arise from not distinguishing the past tense from the present. The historical discussion of *will* is obscured by misprints, apparently.

The new illustrations give the book a special value for the advanced scholar and explorer. It is perhaps worth notice that the quality which makes them most attractive to the explorer renders them, to a certain extent, unfit for a common-school book. We mean their novelty—the fact that they come from rare books or manuscripts which Dr. Morris has been working over for the Early English Text Society. Taken from unknown connections, and presented in their old spelling, they are often quite unintelligible to the uninitiated. Even when they are translated, as they often are, their exact meaning and their real form must be taken on trust. It is in the nature of a historical grammar to compel more or less of such illustration, but the less of it, the better. The old staple examples from the familiar authors, commonplace as they are to scholars, are the best material after all for the school-room. We want them to continue to be commonplaces with the next generation. Extracts from Milton, the Bible, Shakspere, or Chaucer may well pique the curiosity if they are strange, or challenge a permanent place in the memory of all who speak the English language; but the 'De Regimine Principum' and the four different manuscripts of the 'Cursor Mundi' are quite another matter.

About forty pages are given to the affixes of derivation. This part is not to be compared in thoroughness with some of our American text-books—with Professor Gibbs's 'Teutonic Etymology,' for example, or Haldeman's 'Affixes'—but it is a great advance on the common-school books published in England. Dr. Morris promises by-and-by an 'Historical Syntax,' which will complete his grammar work.

The 'English Grammar' which Dr. Morris has made for Macmillan's series of Literature Primers is a brief statement of the outlines of grammar made in the author's happiest style. It would be hard to improve it without adding to its bulk. Grimm's law is not here; the conjugations of the verb are all right; the illustrations are happy and clear; there is a neat outline of syntax—all in about 100 duodecimo pages. It has not the lessons of practice which our teachers know to be essential to the teaching of grammar; but they may be taken from another book. Perhaps the most notable thing in it is the giving of the paradigm of the passive progressive form, *I am being praised, I was being praised*, without note or comment. This is in a primer of the President of the Philological Society of England. American grammar-makers and verbal critics, take notice.

---

*The History of Democracy;* or, Political Progress, historically illustrated, from the earliest to the latest periods. By Nahum Capen, LL.D., author of 'The Republic of the United States of America; its duties to itself and its responsible relations to other countries,' etc., etc. With portraits of distinguished men. Vol I., 8vo, pp. 677. (Hartford: American Publishing Company. 1874.)—The volume before us appears to be a part of the introduction to a history of the Democratic party. It begins with a dissertation upon Party—in church and state—after which follow sections upon "the Tory party," representing "the Conservative principle," and "the Democratic party," which "represents the great principle of progress." The rest of the volume is made up of whatever facts in the history of the world down to the American Revolution seemed to the author to bear upon his subject. It is evidently the result of a vast deal of industry and very extensive and miscellaneous reading, illustrating the author's definition, at the beginning of the Preface, that "history is the science of knowledge"—that is, it would seem, that pretty much all facts are relevant to it. We do not find anywhere a definition of the term democracy any more precise than that quoted from Senator Allen of Ohio in a note to page 22: "Democracy is a sentiment not to be appalled, corrupted, or compromised. It knows no baseness, it cowers to no danger," etc. There are two or three pages each devoted to the democracies of Athens and Rome; but we have searched in vain for any notice of the really remarkable features of these democracies—those by which, for instance, the "fierce democracy" of Athens put curbs upon its own power and established what came nearer to a scientific system of legislation than perhaps any other nation has ever possessed. The great historian of Athenian democracy performed, we think, no greater service than in his exposition of these features of it. What is true of Athens is true of the historical introduction as a whole. It is democracy in its crude form, as an impelling power, that attracts the sympathies of the author; he has no eye for the checks and balances in which the goodness of a government so largely consists, and without which the democracy that he admires is nothing but a self-consuming fire.

We confess that we cannot fully make out Mr. Capen's train of thought. He has very oddly published this huge volume with no subdivisions at all; none, that is, which rest upon essential subdivisions of his subject. There is a break every few pages, with a heading in quite small capitals, sometimes indicating an important topic, sometimes a mere paragraph; and the order in which these come seems very much a matter of haphazard. Thus "The Democratic Party" is followed by "The Objects of History"; then, "The Mosaic Account of Creation," "Interpretation of Language—Uncertainties of History," "Republics of Greece and Rome"; and further on, "France," "England," "Origin of the American Colonies," "Equality is best Commenced in Poverty," and "The Principle of Integrity"—all on an equal footing. The matter is as ill-digested as arranged. Mr. Capen has no mercy for the hard-worked readers of the present day, but appears to have emptied his note-book into this volume—of course containing many valuable memoranda, but much also that is utterly irrelevant. As a consequence, he only contrives to bring his subject down to the reign of George III., and closes the volume with an announcement that the next volume will commence with the subjects of War and Revolution by way of introduction to the history of the American Revolution.

# Fine Arts.

## FIFTIETH EXHIBITION OF THE ACADEMY OF DESIGN.

IV.

WE welcome with joy unfeigned an exhibition in which landscape art holds a somewhat subordinate rank, instead of that place of supremacy which was formerly the dread of the ordinary visitor, and which in some years reached a point so absolute that walking through the Academy seemed like exiling one's self among wildernesses where the human form was unknown. Yet the landscapes this year, though not ungracefully held in the shadow by the abundance of interesting figure-pieces, include a sufficiency of good works, and show here and there the fresh styles and inventive conceptions of new-comers. Perhaps the best—certainly the highest example of synthesis in landscape treatment—is the large view of Perugia (358), by Inness, in which the different objects, massed together on account of the common support they give each other, collect upon the sight with the grace of a fine group of statuary. This artist is always praiseworthy in the breadth he keeps in his treatment—the suggestion of infinite detail, without any uneasy dwelling upon or running after the individual shapes that would beguile another sort of mind. The connecting element in the present composition is the wind; a breeze that, having set all the shadowy olive-trees to the left in motion, leaves them fluttering, and lapses away in rocking the willows to the right. The two sorts of movement are beautifully discriminated, and the tremulous shudder of a whole orchard of light-leaved trees is understandingly given. The rise and fall of color and the placid contrasts of light are poetically managed over the whole of this intricate and self-consistent composition. Mr. W. T. Richards shows in No. 364 the result of his late infatuation with apple orchards. A collection of wilful and crabbed old trunks is the result; but it is singular to see how promptly his charm escapes when he abandons the one specialty of minute analysis he has learned. These trees, neither detailed nor sketched with spirit, might have been painted by almost any one. In his better-known style he has a beach-picture (229), in which the eye quickly gets entangled among the long, sinuous lines of lifting water, and becomes a bewildered prisoner, overcome with the coldness and unsociableness of the sea. Mr. Bellows shows a "Water By-way" (197), with canal-horses, sluices, and palpitating masses of trees, the whole adhering together, in the manner of this artist, like a fortuitous concourse of jellies. Mr. Dubois has a landscape with willows (334), in which a clear summer sunshine masses and arranges the composition with much breadth, and a calm generalizing intelligence defines the relation of things with sculptural sharpness. In a lesser way, the landscape of Ernest Parton (493), with a pebbly river-bank, reads the same lesson of largeness and serenity. In the opposite style, Mr. Arthur Parton shows the detailed growth of small things accumulated around a mountain brook (328), with plenty of patient and skilful study, but with something arbitrary about the way in which all the young growths expand into similar fan-shaped extremities. Mr. McCord, an artist whose improvement we have watched for several years with increasing pleasure, has a "Glen" (328) filled with leaf-study similar to Mr. Arthur Parton's, and showing less of that determination towards a strong black-and-light effectiveness which has made some of his former works resemble colored woodcuts. The better-known artists of our older school are nearly all represented, though Mr. J. D. Smillie's talent is rather imperfectly exhibited in a small aquarelle of scenery near the White Mountains. His picture shows the infant Saco, that cleanest of waters, bathing the roots of graceful trees, beside a pathway peopled with well-disposed figures. Mr. Whittredge contributes a beautiful sunset in the woods, with the cathedral-like stems grouped in couples, and standing apart to let in the light from the rich horizon (206). Another of Mr. Whittredge's scenes (354) shows the leafy privacy of a trout-brook that is completely lost in foliage—a picture which happens to balance well the "Midsummer Retreat" (342) of Mr. Wyant, wherein we are almost consoled for the loss of Kensett by nature-painting so much in his sweet and healing strain. Mr. McEntee exhibits a small, vaporously-sad expanse of sterile landscape called "Autumn" (417); and a fine subject, with sky in bold impasto and admirably-fitting groups of children, expressive of "Saturday Afternoon" in winter (220). The extreme ability of the artist in giving an intelligible and very deep sentiment to landscape, by the simplest means, is present this year in all its force. Mr. Church does not contribute, though a painfully-finished tropical scene of his, the "Valley of Santa Isabel," is to be seen in a public gallery a few blocks distant from the Exhibition. Mr. Bierstadt has several paintings on view, the repetitions of old stage-tricks learnt long ago and now continued by rote. The good drawing of Mr. Fitch's large composition, "In the Woods" (192), with a hunter and boy breaking their way through some very rough timber, poorly compensates for the cold purplish tone, hardly credible as pertaining to the hunting-season. Mrs. Coman shows some small woodland subjects (130 and 278), a path through an American forest and a perspective down a French lane, painted with a very refined selection of grays and tender greens, and indicating the repose of high-bred art. Mr. George H. Smillie represents sunset on a Florida lagoon (300) in one of those carefully-mingled compositions and broad inundations of color which disrespectful young persons call omelettes and the more credulous style chromatic experiments. We still have among our critics and public a class of observers who call an artist a colorist when he employs a variety of bright paints, whether the results be false in tone or not. Thus, Mr. William Hart displays a florid bouquet of tints in a picture called "Keene Valley" (271), and the spectators exert their memories to recall similar effects from nature which might justify the artist and confirm his repute as a master of color, rather forgetting the fact that sensitiveness to color may be shown in a picture that is almost gray. Mr. J. M. Hart sees landscape somewhat less in the style of window-gardening, and is ambitious of excellence in cattle-painting. His animal study is as yet, however, entirely too weak to let him put cattle into foreground positions with impunity. His two pictures, "Buck and Bright" (274) and "Bouquet River" (350) have both of them prominent groups of animals, relieved against each other and against the scenery in the manner of Voltz of Munich, but deprived of the anatomical knowledge which gives Voltz's cattle their reason for existence. The palm of animal-painting must very clearly be assigned this year to Mr. Peter Moran, who sends a cow and calf admirably modelled and posed amidst a creditable landscape; the tone of the cow's white hide, as well as her drawing, and the expression of ungainly awkwardness in the young calf just getting over a great log, are true to nature, and indicate original study as apart from the conventional. Mr. Edward Moran sends marines, and one good picture of an osprey's nest—"Moonrise at Gull Island"—all of which are meritorious with a sort of scene-painter's merit, and make us think of the time when Roberts and Stanfield were busy with orders for decorating the London stage. Mrs. Greatorex shows a number of her picturesquely-ragged drawings in ink, including an excellent study from Salvator (112). Mr. W. S. Macy's "View near Munich" (244), while good artistically, seems to carry with it the air of that dankness and bad drainage which have given such a bad sanitary repute to the Munich region. A very praiseworthy study of the interior of Saint Mark's, at Venice (295), is by Mr. Dyer; it does not convey that feeling of tender, colored, scintillating, and gold-shot gloom which is the characteristic of the church, but for a study in the manner of a revelation, in which all the sumptuous ornament of St. Mark's is indicated under some exceptionally perfect condition of illumination, it leaves nothing to desire.

Figure-pictures we have not noticed heretofore are Constant Mayer's "Orphans' Morning Hymn" (530)—an academic group in a church, correct and unimpressive—and Lambdin's "Study in June" (366), a statuette-like girl in muslin; by an awkwardness of relief not often seen, the whitest and most illuminated part of the statuette is relieved against some very black grape-leaves, and the darker side against brightness; the opposite kind of relief is well known to associate usually in a better manner with unity of composition and distinction of style. The latter artist shows, besides, a rustic idyl, a young haymaker pausing to coquet with a broad-shouldered and graceless girl: the complete want of art-feeling in the female figure may be contrasted with the character in any one of Mr. Homer's subjects. Mr. Homer's brush may insult his model with a great deal of neglect and the most cavalier treatment, but it always leaves her unimpaired in elegance, purity, simplicity, and a distinguished pose. While alluding to figure-pictures we should speak of Le Clear's excellent male portrait, in less than kit-cat size (465), to Mr. Baker's disgracefully commonplace likeness of Beecher (484), and to Mr. Butler's aristocratic but feebly-forcible interpretation of a magnificent model in the "Portrait of a Lady" (312).

Our prominent sculptors appear to have applied themselves to monumental work during the year, and there is hardly any plastic art on exhibition. A fairly good marble bust of Mr. W. M. Evarts, by Mr. St. Gaudens (513), a rather coarse bronze one of Mr. John Kelly, by Cushing (520), and a decidedly elegant decoration by Mr. Bauer, called a "Sleeping Cherub" (521), are all that require indication.

# The Nation.

*NEW YORK, THURSDAY, MAY 27, 1875.*

## The Week.

IT has been a lively week in Wall Street, attended with a large decline in the prices of speculative stocks. The grasshopper-plague, the continuance of the railroad war, and the uncertainties in regard to Erie, have all contributed to the depression. There have been no new developments in Erie, but a multitude of doubts have been raised, all calculated to unsettle the market and discourage the holders of the Company's bonds and stock. The former fell 3 to 6 "points" early in the week, and the stock has been down to 18 in London and 19 here. Investment securities suffered little by the demoralization of the stock market, the low rates for money keeping the demand for these large. Currency continues to accumulate in the New York banks, the legal-tender notes now exceeding $61,000,000. The dulness of trade is shown by the limited demand for discounts at the banks, and by the extremely low rates at which money lends on demand, as well as by the low rate at which mercantile paper sells. Paper which in a healthy condition of affairs sells at 7 per cent. is now sought by those having money to lend at 4 to 4½ per cent. It will be strange if this low and unhealthy condition of the money market do not breed speculation before the summer is passed. The speculation in Erie, both here and in London, has had the effect of diminishing coin exports; Erie shares have been forced enough lower in this market to make purchases here and sales in London possible at a handsome profit nearly every day during the week. These operations have been carried to the extent of supplying this market with exchange. The gold clique have made little headway either in advancing the premium or in establishing high rates for the use of gold. Until something of a less temporary character than the Erie speculation intervenes, there will be no reason for changing our opinion that the coin exports during the summer will be unusually large.

---

We publish on another page a letter from the New Hampshire Secretary of State, on the subject of the recent Democratic "outrage" in that State. We have not taken any side in the matter, nor do we mean to now, further than to say that, granted the facts and the law as they are stated in Mr. Butterfield's letter, no wrong whatever seems to have been done. As a general thing, the law of elections, particularly as it regards abbreviated names of candidates, is by no means a very lucid branch of the science, chiefly because most election cases are decided by legislative committees, which make use of the law to give color to foregone conclusions, instead of making their conclusions depend on the law. In New Hampshire, however, all question seems to have been avoided by the insertion of a distinct provision in the constitution to the effect that every ballot which does not contain the "full Christian and sirname" of a candidate, "with the initial letter or letters of the middle name," and "the usual abbreviations of junior, second, third, and the like" "shall be regarded as a blank and not counted." This seems to dispose, without possibility of dispute, of the case of "Natt" Head, about which so much has been said, while, as to the Fourth District, the rejection of votes cast for ineligible persons appears also to have been unavoidable. There may be other circumstances which have not been distinctly stated that will account for the uproar that has been made; but this is a question whose decision we must leave to those better informed than ourselves. Considered abstractly, no desperate injustice was done, inasmuch as the candidates declared elected both had a plurality though not a majority of the votes cast.

The Centennial Commission has held a meeting in Philadelphia, and a programme for the opening exercises of the Exhibition has been submitted, which seems to cause much chagrin in Pennsylvania, because in it the poet, the reader of the Declaration, and one of the orators all come from Massachusetts, while not a single Pennsylvanian appears on the list at all. A Philadelphia paper has therefore prepared a list which gives all the offices to Massachusetts except that of Treasurer (this post being retained for a Pennsylvanian), making General Butler Grand Marshal, and General Banks Master of Ceremonies. The *Bulletin* then goes on in the same frivolous vein to suggest that if the Commission differs from it in "concentrating the Centennial programme" on the single State of Massachusetts, its "second choice" would be that one office shall be given to Pennsylvania. It objects to the selection of Mr. Emerson as reader on the ground that though he can unquestionably write "he cannot read," and is therefore the most unsuitable of selections; and it proposes, "if the reading of the Declaration is to be a merely nominal one, not intended to be heard," that the "venerable and honorable Horace Binney" be selected—though, as a Harvard graduate, we should suppose exception might be taken even to him. The *Bulletin* then goes on to declare, in a sentence of somewhat doubtful construction, that "Pennsylvania has at least two native poets who will write a centennial poem more in time and tune with the great occasion than what the poet-laureate of Massachusetts would probably write"—these natives being Mr. George H. Boker and Mr. Bayard Taylor.

---

How these questions will be ultimately settled we do not know, but the Pennsylvanians ought not to forget that there is a strong feeling among our people that the energies of the State have for a long series of years been devoted to the accumulation rather of material than of intellectual strength. The manufacture of pig-iron is no doubt an excellent thing, but, under the peculiar temptations to embark in it afforded by the imposition of a heavy tax on the country at large, the intellectual development of the community could hardly help taking a subordinate direction, in harmony with its material pursuits. In Pennsylvania, therefore, while the advance in protected manufactures has been very great, that in the domain of science, art, and letters has not been very astonishing, and the intellectual development which has been accomplished has been, as it were, mainly incidental or ancillary to pig-iron. If it is really desired to give the centennial a local character, Judge Kelley and Mr. Henry C. Carey, who are almost themselves products of the industrial system they have done so much to foster, should certainly not be omitted; and we would suggest that instead of reading the Declaration of Independence, or immediately after it, a very effective hit might be made by having some of the more stirring and exhilarating thoughts of Mr. Carey read by Judge Kelley, followed perhaps by some original remarks of the latter on the currencies of the world. We can hardly imagine a more startling or effective way of showing the representatives of European thought who may be present, how perfectly compatible is great industrial prosperity with ignorance of economic law and contempt for economic knowledge.

---

The Legislature of Iowa, during its last session, passed what is known as "the Iowa Railroad Tariff Law"—an act to establish reasonable maximum rates of charges for the transportation of freights and passengers on the different railroads of the State. The act classifies the railroads according to their gross annual earnings per mile (at the time the act was passed). By it Class A (railroads earning $4,000 and more per mile) cannot charge more than 90 per cent. of the fixed rate established by the act. Class B (railroads earning $3,000 per mile) cannot charge over 5 per cent.

above the fixed rate. Class C (railroads earning $2,000 per mile) cannot charge over 20 per cent. in addition to the fixed rate. For passengers, Class A cannot charge more than 3 cents per mile; Class B not more than 3½ cents per mile; and Class C not more than 4 cents per mile. In a case under this law decided by the United States District Court, the Chicago, Burlington, and Quincy Railroad Company asked for an injunction to restrain the Attorney-General of Iowa from prosecuting certain suits brought by him against the Company under the provisions of the act—1st, Because the act is in conflict with the Constitution of the United States, in that it impairs the obligation of contracts, and is a regulation of inter-State commerce; 2d, because it is repugnant to the constitution of the State of Iowa, in that it does not affect all railroads alike, and is therefore not of uniform operation; and, 3d, that it conflicts with the Bill of Rights. In the opinion of the Court (Dillon, J.), railway corporations chartered by the State, with the *express or even implied* power "to make contracts," have the power to demand and receive compensation for their services; but this is far short of conferring upon them an *exclusive* power in this respect and one beyond future legislative control; a railroad, in its public character, is an improved highway; its life is due to the exercise of State and national prerogative of eminent domain and taxation; and its public character is not divested by the fact that its ownership is private.

---

The Court was content with holding that the Legislature of Iowa has not "*expressly conferred*" upon any railway corporation therein exclusive power to fix their own charges; that such power cannot be arrived at by implication, and that whatever powers are conferred in this respect are subject to an implied condition that they shall not be exercised oppressively or unreasonably; that they are at the same time subject to the future exercise of police regulations of the State, or of any other power possessed by the State in its nature legislative, which includes the power to regulate consistently with the charter the franchises granted, and to prescribe and limit the amount of charges which it shall be lawful for the railroad to take for transportation. As to the question of inter-State commerce, the Court held that the State could only have legislative control over the roads within its own borders, and, recognizing the fact that our railroad system is made up of parts supplied by several States, the Court expressed a doubt whether a power in a State thus limited to its own local borders and interests could be beneficial in its exercise, and remarked that it was a "legislative problem and not a judicial question." Presiding Justice Miller took no part in the decision, from the fact that all these questions will soon be before him in the United States Supreme Court, and he desires them to come there without any expression of opinion by him. Another case is before the Court, involving the question whether a company can be compelled to operate its road under the rates established by the above act when it would thereby not be able to earn expenses; in other words, can a railroad be compelled to do service without compensation?

---

It seems that we fell into an error in speaking, a week or two ago, of the State of Michigan as having been "for the last twenty years a solitary, or almost solitary, instance of a community constitutionally prohibited from even allowing themselves to say what they would and would not drink"; the fact being that the constitution forbids the passage of a license law, and does not prohibit prohibition. Still, we are unable to see that the case is much less singular. As it is, the community says: We will not prohibit ourselves from prohibiting ourselves to drink whiskey, wine, and ale; we will permit ourselves to prohibit ourselves from drinking; but what nothing shall ever tempt us to do is to allow ourselves to permit ourselves to decide that we will drink under certain restrictions. For a community solemnly to declare that they are willing to have prohibition or "free rum," but nothing between, is, to our mind, even more singular than the provision as we originally gave it. The clause in the Michigan constitution relating to this subject is as follows: "The legislature shall not pass any act authorizing the grant of license for the sale of ardent spirits or other intoxicating liquors." The legislature having now passed a law imposing a tax on the liquor-dealers, the question is whether this tax is or is not substantially a license law. We should like to see this question discussed by the Grangers. The proper way of settling the difficulty would be, it strikes us, to impose and collect the tax, and then pass a prohibitory law confiscating all the liquor in the State. In this way a large sum of money might be got by the State, and an odious traffic would receive its death-blow.

---

Newspaper calculations as to the chances of a Presidential election a year in advance of the nominations are not apt to be very valuable, and this year, owing to the unexpected and bewildering Democratic victories of last autumn, are even less valuable than usual. The manner in which the calculations are made on the two sides is this. The Democrats say: in the first place, the whole number of electoral votes is 369; 185 being necessary for a choice. The entire South is now Democratic, and casts 138 votes, leaving only 47 necessary to carry the election. New York will throw 35, California 6, and New Jersey 9, or three more than is required. To this the Republicans reply—in the first place, the South is not a unit, for Louisiana, Alabama, Mississippi, and Florida are doubtful, while South Carolina is certainly Republican, and there is no good reason why North Carolina should not vote the Republican ticket, as was done in 1872. To this the Democratic journalist replies that this is very true, because every one knows that North Carolina was carried by fraud in 1872, while in 1876 there is not much reason to anticipate any danger of that sort. Williams is now out of office, and the plan of dragooning the South has been perforce abandoned. Then, besides this, even if a few of the Southern States should be coerced into voting the Radical ticket, all the Northern States which went Democratic last fall will do so again, and, with Massachusetts casting a Democratic vote, what can be expected for the Republicans? This, however, does not satisfy the Republican journalist, for he maintains that last year was an "off-year"; that Northern States have, as in the case of New York, before now gone Democratic in an off-year, and then redeemed themselves at a Presidential election; and that the substitution of Pierrepont for Williams, and the reorganization of the Cabinet now going on, will, so far from having a bad, have an extremely good effect on the fortunes of the party, because it will prove to the people that the grand old party is determined upon reform, and will thus "bring to its side all the reformatory elements of the country." With plenty of paper and ink, we do not see why the discussion should not be carried on from now till this time next year, but it is a gratifying indication of the improved tone of politics that we have so little speculation now as compared with the amount which formerly filled the newspapers. The leading newspapers on both sides seem thoroughly impressed with the vital truth that the important thing for them to do is to discuss the present behavior of the two parties, and not their probable future chances, as they may be affected by what either thinks of the other.

---

The New York Legislature has adjourned without distinguishing itself either for good or evil. What would have been the character of its proceedings had not the Governor given such a decided direction to them by his message on the canals, it is difficult to say, but on the whole the session has been marked by comparatively little predatory legislation. A vigorous assault was made on the charter at the beginning of the session, but, thanks to the firmness of the Governor, it was defeated, without breaking up, as was feared by the timid, the harmony of the Democrats. This failure must have rather taken away the high spirits with which the members came together, and the canal message seems to have finished the work. The Legislature adjourned in a decorous, quiet

manner, without any tomfoolery or horse-play, and, owing to the number of things they refrained from legislating upon, have been "let off" quite easily by the press. The session has been made noticeable, among other things, by the performances of the Speaker of the Assembly, Mr. Jeremiah Maguire, who managed to create some confusion and discord at times by disappearing from the chair, calling some other member to occupy it, and then making a furious harangue on the subject under debate. Toward the end of the session, however, he too became calmer, and at the adjournment made a dignified and sagacious speech on the press, its position and duties in the modern state, its relation to the Government, its great power and influence, and the abuses to which this power is exposed, which was listened to with marked attention by the assembled legislators and reporters. It is said that Mr. Maguire has given the Democrats so much trouble that he will be dropped next year.

---

A bill has been introduced into the House of Lords to regulate the practice of vivisection, which is said to have the support of several eminent naturalists and physiologists, including Messrs. Darwin and Huxley. The main object of the bill is to prevent vivisection from being practised secretly, and for this purpose it proposes to enact that vivisection shall only be performed in places registered for the purpose. It is also provided that an "inspector of anatomy" may at any time visit and inspect these places, and that anæsthetics shall always be used. These provisions, it is supposed, would prevent the practice now so frequently denounced by Bergh and other reformers—if it exists at all—of vivisection carried on by scientific barbarians for the mere devilish satisfaction of their own love of the infliction of pain, and would ensure at least the possibility of the public's always knowing or finding out what the vivisectors were about.

---

The settlement of the Guikwar of Baroda's case by the Indian Government, by the deposition of the Guikwar, does not give the English press any more satisfaction than the extraordinary measures taken for his trial did. The grounds on which he has been deposed are general misgovernment and incorrigibility. But the English critics of the Indian administration say the Guikwar was not tried for these faults, but for an attempt to murder, and as to his guilt the court disagreed. Under these circumstances, the Government might either say that they took the view of those members of the court who voted to find him guilty and punish him for his crime, or they might say that they regarded the disagreement as an ordinary disagreement of a jury, and reinstate him. Instead of this, they have chosen to prosecute him for one offence and punish him for another, and this will not be likely to foster in the native mind that respect for British justice which it was the aim of the trial to stimulate. Meanwhile, Mr. Fitzjames Stephen has written to the *Pall Mall Gazette* a couple of letters, in which he proves to his own satisfaction that the Guikwar was guilty; and upon this Messrs. Lattey & Hart, the defendant's attorneys, have also written to the same paper, complaining of Mr. Stephen's want of candor in his examination of the evidence, and proving pretty conclusively that the prosecution had no case. It is tolerably clear that the Indian Government, in trying the experiment of a mixed commission, made a blunder, but it may be doubted whether the native population has been as much distressed by the somewhat irregular mode of the prince's deposition as the English public have been. Sergeant Ballantine, who went out from England to defend the Guikwar, has come out of the case better than any one else, for he has made a large sum of money, and on his departure from India received also a grand popular ovation from the natives, who looked upon him as a sort of saviour.

---

It is well known that Alfonso's Ministry has wreaked its reactionary spite on the institutions of learning by ordering that the course of instruction established for many years shall be subordinated to Catholic dogma. The full meaning of this subjection is nowhere so well understood as in Spain, and the circular of Señor Orovio was answered by such a prompt and extensive hegira of instructors that resignations were declared analogous to desertion in the face of the enemy, and punishable by imprisonment. Two instances of persecution in this guise are described in a letter by Mr. Arthur Arnold to the London *Times*. One of the victims is Señor Nicholas Salmeron, author of a considerable work on anthropology, and "perhaps the most able, the most influential, and most beloved of the professors of the University of Madrid." He protested manfully against conforming his lectures to the Ministerial circular, which he denounced as unconstitutional and illegal. He had never, he said, mixed his educational functions with the political opinions he held as a citizen, and he would not be guilty of the "stupid error." His refusal thus to degrade his professorate was met by imprisonment in a small town in the north of Spain, away from his family and friends. A still greater hardship was visited upon his colleague, Señor Giner, who at the time of his expulsion from his chair was suffering from an affection of his lungs which kept him to his room, and who was nevertheless transported with heedless exposure to Cadiz, where he has since lain a prisoner in hospital, in default of his ability to endure the voyage to the Philippines—his ultimate place of banishment. The Ultramontane press has indulged in characteristic rejoicing over this benighted policy, directed against men whose lives have been divorced from politics, and whose teachings have simply reflected the liberal spirit of the age. Mr. Arnold regards it as an attack in the rear on Germany, partly on account of the present attitude of that country towards the Papacy, and partly because German philosophy has been directly imported into the University of Madrid by two professors, now deceased, who have left behind them published works and active disciples.

---

The latest China mail brings information of the adoption of a policy looking to a more complete settlement of Formosa. The new special commissioner for the affairs of that island has brought about the abrogation of an old law prohibiting emigration to it from the mainland, and has also had removed certain restrictions on its industry and trade-exports. The Chinese view of protection being, like the mediæval, based on the logical assumption of hostile interests between different parts of the same country as well as between foreign countries, no person in Formosa was permitted to engage in iron-founding without a license from the Treasurer of Fokien, and the iron used had to be brought from Changchow under penalties for the unauthorized extraction of the native ore. The existence of such discriminations was really, in Chinese as in American political economy, proof of close relations between the colony and the Empire, and not the contrary, as Japanese diplomacy was recently inclined to assert. The customs barriers through which trade with the interior of China is taxed, belong in the same mediæval category. No little excitement has been caused in Tientsin by an effort on the part of the customs Taotai to collect the so-called barrier tax immediately upon payment of the customs dues. The result of such a plan of preventing evasions of the tax would have been to ensure the importer but a single pass for his invoice, so that when this came to be divided for distribution to different parts of the interior, all but one lot would be exposed to fresh taxes at the barriers. Remonstrances from the foreign consuls caused the application of the Taotai's decree to be confined to native merchandise, but induced another proclamation reclaiming unpaid barrier taxes on all native goods imported during the previous six months. The native traders thereupon determined to stop doing business altogether, and actually shut up their shops in defiance of the Taotai. This "lock-out" of the Government proved effective, and the Viceroy intervened to restore matters to their *status quo*. The Taotai, who had been carrying out superior orders, resigned.

## THE LAST RUMOR OF WAR.

THE rumors of impending war which have been afloat in Europe for so many weeks, if they have no other value, may serve to give us an idea of what we may probably look for in the way of alarms for many years to come. The late struggle between France and Germany has left behind a stock of mutual hate and suspicion which contains materials enough for several wars, and as long as this exists, and there is as much money to be made out of rumors as may now be made on the Stock Exchange, we shall have, every year or two, fits of uneasiness and anxiety like that through which Europe has just been passing. Moreover, the very readiness for war which such a state of things produces has of course a strong tendency to bring war about. The maintenance of such military systems as both France and Germany now possess is not possible both without giving purely military considerations undue weight with the governments, and without fostering the military temper—or, in other words, the disposition to look for causes of offence—which may be said to lie at the root of military morale. A patient, forgiving army, or an army loth to take offence, and not given to self-assertion, is, as Lecky has somewhere well pointed out, almost a contradiction in terms; and when we make the people and the army identical, we do much to give weight and gravity to small international differences. This consideration may be set off, to a large extent at least, against the enormous industrial disturbance caused by a resort to hostility in our day on the part of a state which not only has a large army, but whose reserves have always to be taken directly from civil life. The German shopkeeper or mechanic or farmer must, like such men in other countries, necessarily have always a strong interest in the preservation of peace; but this interest will be, in all likelihood, diminished by the fact that he has served in the army, and still forms part of it, and takes more or less pride in feeling like a soldier.

We have, we may add, the utmost confidence that, in spite of everything, the weight of German feeling and opinion will in the future as in the past be in favor of peace, because peaceableness is a matter of temperament almost as much as of circumstances, and the German character would have to undergo an enormous change in order to become anything that could fairly be called bellicose. But then, circumstances have changed for the Germans, and circumstances have their weight, and must be allowed for in estimating the chances of peace or war. The great difficulty they have had in securing the national consolidation, and the terrible suffering and humiliation which preceded it, naturally produce more or less fretfulness and even truculence now that they have attained the goal of their desires. They are not yet perfectly sure of the prize, and cannot feel satisfied that their enemies have utterly lost the power as well as the wish to mar their fortunes.

In calculating the probable course of French policy, it will not do to attach too much importance to the influence on the national mind of the loss of Alsace and Lorraine. This was doubtless a cruel blow, and must prove for an indefinite period a source of keen irritation, but to say that, if Alsace and Lorraine had not been taken, the temper of the French would be any more pacific than it is now, would be saying much more than there is any warrant for. Those who are still familiar with the history of the period between 1815 and 1830 must remember that though France had then, through her disasters, lost no territory to which she had the least sentimental attachment, and suffered but little from invasion beyond the exaction of a heavy indemnity, and had only been worsted in a war of her own making, revenge for Waterloo formed during the succeeding twenty years the principal feature in every political programme which had any popularity. Besides this, the Liberals, who were most troubled by the reactionary tendencies of the Restoration, were avowed partisans of Bonapartism; and the most powerful of Béranger's songs, of the influence of which on opinion this generation has but little idea, were devoted to glorification of the Imperialist régime, above all in its military features, and to making peace and non-intervention appear contemptible. In short, if any deduction applicable to the present crisis be permissible from recent French history, it is safe to assume that any exasperation from which Frenchmen are now suffering is rather due to the changed position of France towards the rest of Europe, than to any material losses she has sustained, and that it will undergo no diminution as long as the Government has as little weight as it has now in European councils, and as long as Frenchmen fancy that influence can only be recovered by fighting, just as it has been lost by failure to fight well.

But then, just as the desire to avenge Waterloo died out, partly under the influence of time and of peaceful intercourse, but mainly under experience of the fact that a country containing over thirty millions of men as brave and ingenious and industrious as Frenchmen are does not need to fight in order to secure its legitimate authority in the eyes of other nations, we may be sure that now every year that France refrains from fighting the desire to fight Germany will grow weaker, and that it will finally decline to its normal degree with regard to that as to every other country, because even Frenchmen will see that their recovery from prostration is sufficient to restore their reputation; that the bad management of the war has not permanently diminished French military prestige; and that any nation which exhibits the enormous capacity for accumulation which France possesses would be a formidable element in European politics even if it had only one hundred thousand men under arms.

That the scheme attributed to some German military men of attacking France again now, before she has completed the reorganization of her army, for the purpose of crushing her beyond redemption, has ever been seriously contemplated by German statesmen, we do not believe. Even supposing Bismarck to be equal to anything so diabolical in point of morality as this would be, he is too shrewd a man to think of it as practicable. There is such a thing as presuming too far on the power of mere military strength; and nobody seriously supposes that disregard for what is called the balance of power has reached such a point that the prospect of seeing France reduced to the condition of the Grand-Duchy of Cracovy, would not bring her an ally from among the other great Powers. Every one of them has a strong interest in preserving her as a respectable if not as a domineering part of the European political system; and it has to be remembered that though Germany may be more than a match for her, the total defeat of a tolerably well-organized and decently-led French army is an exploit which would leave neither Germany nor any other European power much strength to spare. With an ally, even a feeble one, France must always be an antagonist which neither Germany nor any other power could engage without anxiety. There is, too, in French fortunes an element of uncertainty which is characteristic of the people, and which must make the most self-confident victor hesitate about pushing her to the wall. She has four or five times in her history been reduced to the lowest depths of exhaustion without apparently touching the springs of her energy and vitality. She has now been for eighty years in a condition bordering, even in the best times, on anarchy, and without a particle of the security as to the future which with other nations is almost necessary to existence, and yet it has not seriously affected either her material prosperity or her industry. She ploughs, and sows, and reaps, and weaves, retains the cunning of her hand and the fertility of her brain, with the full knowledge that she is sitting over a volcano. She does not become great in the highest sense of the word, or free in any sense, but she remains a considerable force in modern civilization, and has an army which no enemy ever yet engaged without at least wishing that the day were well over.

## IMPROVEMENT IN PUBLIC SCHOOLS.

ANYTHING that Mr. Charles W. Eliot has to say on the subject of education is sure to deserve attention. As president of one of the two oldest and best colleges in the country, he is in a position

to study and observe thoroughly not only those questions which immediately relate to the "higher education," but those which are suggested by the condition of the lower strata and their connection with the upper. Both as a writer on education and as a college president, he has been eminently successful in persuading people of the truth of his ideas, and in carrying them into effective operation. His article in the last *Atlantic* on economy in schools is one which ought to be read by every one. What he says with regard to them is substantially this: There is at the present time a strong current of opinion in favor of economy in city and town expenditure. This is a healthy tendency, and it is much to be hoped that it may prove strong enough to bring honesty and economy into the administration of public affairs; but it is of the utmost consequence that behind the eager desire for economy there should be a well-informed and careful judgment concerning the best methods of retrenchment. Particularly is this so as regards the public schools—a department which we see is often selected as that in which economy is to be tried. Every one will agree that nothing should be done merely for the sake of saving money which will make them, in the judgment of competent persons, worse than they now are.

Mr. Eliot then proceeds to examine a few of the common ways of economizing in public schools. The first of these is to build a large school-house, which will contain every child that can possibly be sent by the taxpayers, instead of building several smaller ones. Of course this proceeding saves money, but it impairs the quality of the schools, unless the school is situated in some district in which all the people are of one kind; it brings under one roof a horde of children, good and bad, diseased and healthy, of rich and of poor parents, differing in early associations, in religious and moral training, in taste, in intellectual capacity, and differing also in their probable futures—most of them being destined, as most of mankind have been from the earliest ages, to a life of toil, some few to wealth and ease, others to moderate independence. Now, it is obvious that forcing all this heterogeneous mass into one vast school-house to be educated can only mean one thing—a dull uniformity of training and discipline, which will tend for the time being as much as possible to wipe out all individual differences, to destroy individual ambition, and to produce in the end, as Mr. Eliot says, an "average product," a sort of mental, moral, and physical mean standard, which has been obtained quite as much by stunting what is good in the children educated as by forcing work out of the dull. In fact, the general result is a good deal like the result in an army of a uniform drill. You can obtain out of very indifferent material a good average soldier, who will stand fire, fight with coolness, and obey orders; and so you can in a gigantic school turn out a well-drilled scholar, who will pass an examination creditably, and who will be able to show a good record for industry; but this is not education. What we want in education is the development, not the repression, of individuality at all points.

Again, a favorite way of "economizing" is to reduce the proportionate number of teachers. Mr. Eliot thinks that twenty-five is as great a number of children as can be taught by one person, but it is no uncommon thing to find from forty to sixty children in a single teacher's hands. Or, money is saved by substituting inexperienced teachers for competent and skilled ones, thus giving the untaught instructor the same opportunity of "fitting himself for the duties of citizenship" that Mr. Boutwell used to think the principal duty of the Treasury in the case of another class. Then, a school-committee will sometimes succeed in economizing by employing a second-rate kind of teacher, reinforced by a good superintendent. Another way, and the favorite of all, is to engage female teachers where men ought to be employed. Women, Mr. Eliot maintains, though their employment is very often advisable, can never be expected to make in all cases the best sort of teachers, because they generally take to teaching, not as men do, for a permanent lifelong calling, but as a temporary occupation, terminated as speedily as possible by marriage. After marriage, a woman does not teach; after marriage, a man does; and, when the best kind of teaching is needed, we must go to the sex which is the strongest, the most enduring, and which has the most urgent motives to excel in teaching considered as a profession.

These being instances of what Mr. Eliot calls "unwise economy" in public schools, he next proceeds to give illustrations of what would be wise methods of economizing. Of these, there are two most important. The first is to make the business of teaching an honorable, secure, and independent means of livelihood, by respectable salaries and by secure tenure of office. The second is to save money, by making the parents of the brighter pupils whose education reaches a certain level, pay for a further advance. Of course, in the case of poor children, he would have the same thing done at the public expense. Few of our readers, we suppose, will dispute the value of these suggestions, which are put forward by Mr. Eliot in a guarded and conservative way. Indeed, it seems an almost self-evident proposition that saving money by lowering the quality of the public schools is the very worst use they can be put to. Nevertheless, we suppose that even the most sanguine person would not after reading the article find himself expecting that its recommendations would be adopted at once in many places. We say to ourselves that this may be very true, but it will not be carried out; and the reasons why we think so are two. The first is comprised in one word—politics, and the second is a sentimental regard for a theory of the public schools which is wholly wrong and vicious and yet has a wonderful vitality.

As to the effect of politics on the schools, it is unnecessary to say more than a word. The schools are in a certain sense the natural prey of the practical politician. If the times are times of wasteful extravagance and reckless generosity, the schools may be preyed upon in a variety of ways; if the politicians have been frightened into a fit of economy, the schools suggest themselves at once as the easiest quarter in which to save. If curtailment of the expenses of the police, the construction of public works, or of the roads is suggested, a yell of opposition is raised by a large number of able-bodied voters "inside politics," who are themselves dependent upon salaries from these sources, and who are able to assist one another to blast the future of any one who attempts to reduce their incomes. With the teacher, however, the case is entirely different. The teachers are not, as a rule, a body of strong, muscular, powerfully framed "workers," who will struggle and resist if oppression is practised upon them; they are half of them young women, and the other half men of a sedentary turn of mind, thoughtful, and trained in science or the classics, living on a narrow income given them by the state, with a dislike very often to active life, and practising those virtues of meekness, forbearance, and humility which nowadays—in the "political arena" at least—are so completely out of place. The extent to which "pressure" of all kinds is brought to bear upon these poor creatures is almost incredible; but when we reflect that in many large cities it is necessary for applicants for school positions to "see" active politicians of the lowest stamp to secure their places, we can easily guess how much may be wrung out of them by judicious squeezing. We have ourselves known of a case in which a well-qualified teacher in Boston, trying to get a particular position, found himself obliged in his search for one of the body having the appointing power to go to a low grog-shop owned by him, and there to state his case to the bar-tender, one of the "workers" for the absent statesman, who, after listening with great suavity to the statement of the applicant, made this reply: "Say no more. Tom Finnegan's got to do what I say; you'll have the place"—a prediction, we believe, not at all verified by the event. It is easy to say, "How shocking, to go to a low bar-room and ask for a 'position' as a school-teacher!" It is certainly a shocking illustration of the influence of politics on the schools; but, politics being as they are, of course places in the schools must in some cases be got by going the rounds of the grog-shops. The practical man, bent on making his way, who goes and interviews Tom's factotum, will get the start of the shrinking man who stays away, and in the struggle for existence the practice of interviewing Tom's factotum comes very soon into vogue.

But there is another obstacle which stands in the way of improvement in the public schools, also political in its character, though not created solely by the politicians: we mean the tenacity with which everybody—politicians, public, and all—clings to an antiquated theory of the relation of the schools to the world outside. It is clear, as Mr. Eliot points out, that improvement in the public schools must be effected, not by making education a uniform, blind drill, but by giving it variety, and recognizing among the pupils the existence of variety produced by that gradual developing and differentiating process which we call civilization. But this is exactly what those who have the direction of the educational machinery refuse to recognize. According to the traditional theory, the public schools are a sort of "miniature republic," in which the scholars are equal in rights, duties, and capacities, as citizens are in public life. In them the children of the educated and the uneducated, the rich and the poor, the proud and successful, and the meek and lowly, all come under the beneficent operation of our institutions—all learn how noble a thing a republican government is. It follows from this that they must all in the eye of education be equal, and any attempt to divide them into groups, to discriminate between those who are bright and those who are dull, to separate those who are at once ambitious and able to pay the cost of ambition from those who merely will take as much instruction as may be forced into them, is regarded as an attempt to break up the American school system. Nothing can be more ridiculous. It is true enough that the schools must be an "epitome of life"; but what, in the name of common-sense, is the life of which they are to be an epitome? Is it a life in which every chance is given to the play of individual ambition, talent, and strength of character, in which energy and rivalry in the struggle for power and wealth are encouraged and rewarded, or is it a life paternally superintended by a superior authority, hemmed in with all sorts of barriers and restraints? There is a strong feeling as regards the schools that "all should pay alike," for instance; but this is not a maxim of general American life. The equality which we boast of is not a repressive equality, intended to prevent the exertion and triumph of individual force; it is nothing more than a guarantee on the part of the public that no one shall be hampered in the race of life by any but natural obstacles. When we turn to the schools, however, it becomes a sort of guarantee that no one shall be permitted to have the benefit of his natural advantages. We know what the result has been: the increasing unpopularity of the public schools among the very classes—the rich and intelligent—who ought to give them their best support; the opening in this way of the school-funds to attacks from every sectarian body; and their impoverishment for political objects.

## ENGLAND.—SCOTCH AND IRISH LEGISLATION.

London, May 8, 1875.

A STUDENT of national character might find material for his studies in observing the different manner in which the Scotch and Irish members of Parliament conduct the political business relating to their respective countries in the House of Commons. There are 60 Scotch and 103 Irish in an assembly of 652 members, or, in other words, the Scotchmen number about one-eleventh and the Irishmen one-sixth of the whole House. The Scotch sixty are thus but a drop in the ocean of representation. But somehow the Scotchmen generally succeed in getting what they want from Parliament, while the Irishmen generally fail; and why, you may naturally ask, should this be? The reasons are not far to seek, and any one may find them by looking a very little way below the surface. It is not that the Scotch representatives have special powers of persuasion or special gifts of eloquence. Even if they had, such agencies would not help them much, because nothing affects the voting power in the English House of Commons less than eloquence. The oldest member of the House could in all probability not point to a dozen instances in his experience where a speech turned the fortunes of a division. The Scotch members, however, are without exception but indifferent speakers. For the most part, they are respectable but rather commonplace country gentlemen, or tolerably wealthy manufacturers and mercantile men, whom their native towns have delighted to honor. In point of ability or eloquence, they are below rather than above the average representative. They are, however, all men of integrity, and, with one distinguished exception, they do not number an adventurer in their ranks. They trust each other, and they have full confidence that no one among them is playing for his own hand to the sacrifice of the rest and the interests of their country. They have, further, the good sense to know exactly what they want, and to ask only for what can be reasonably granted. Starting with such excellent moral qualities, which contrast in some respects with those of their colleagues from the sister isle, they make up for possible intellectual deficiencies by management. They arrange their legislation outside the House of Commons, and, by a little unobtrusive manœuvring, they exercise a modified form of the Home-Rule for which the Irishmen are always agitating. A "Scotch Parliament," as it is called, or caucus of Scotch members, is held in the office of the Lord-Advocate, who represents the Government of the day, and there and then they settle among themselves the terms of the measures and the resolutions which Scotland would wish them to carry. Their proposals, therefore, are cut and dried and settled with the representative of Government before they are introduced into the House, and when they are brought in it is merely to ask for the formal recognition by Parliament of what has been arranged outside. In most cases, this system answers perfectly. Scotland wants but little here below from Parliament, because Parliament cannot affect her climate by legislation, and that is her principal obstacle to prosperity, and she is too sensible to cry for the impossible. The measures that are wanted are mainly of a local, not to say parochial, character, and such measures can be arranged under a semi-private system better than in open debate. English and Irish members are so ignorant of and indifferent to Scotch affairs, that they cannot be got to take an interest in legislation dealing with these affairs. Their knowledge of Scotland is confined, for the most part, to an occasional visit in the shooting season to some wealthy English friend who has hired a grouse-shooting or a deer-forest. They know nothing of Scotch land, or Scotch ecclesiastical politics, or Scotch educational questions—all of them differing essentially from their counterparts in England or Ireland. The Scotch members, at the same time, prefer to be left alone, and accept with a condescending acquiescence the apologies with which English or Irish members always preface their speeches when they interpose in a Scotch debate. They keep their questions as far removed as possible from imperial considerations, and would rather get what they want in a corner than make a great display and fail.

The Irish members act upon a different principle. There is quite as great ability, and much greater eloquence, to be found among them than among the Scotchmen. But they do not trust each other as the Scotchmen do, and they could no more settle their measures and resolutions at an "Irish Parliament," or caucus of Irish members, than they could do so at Donnybrook Fair. They have no official to whom they can look for guidance as the Scotchmen do to their Lord-Advocate. They have a Secretary of State for Ireland, who is always a Cabinet Minister and a leading member of the Government, but he is almost invariably an Englishman, and they have an Irish Attorney-General who holds a position at the Irish bar similar to that which the Lord-Advocate holds at the Scotch bar. But the Irish Attorney-General is not entrusted with the same powers of government over his countrymen with which the Scotch Lord-Advocate is entrusted over his. They would not submit to such authority, and no Irish Attorney-General in his senses would undertake the responsibility of restraining and managing five million Irishmen. The Lord-Advocate can and does rule his three million Scotchmen, because they are an orderly and prosperous race. But he would be a bold lawyer who would undertake a like task for Ireland. When, therefore, Irish business comes into the House of Commons, it is as often as not the signal for a free fight all round. No one can guide the erratic councils of the hundred-odd Irish members, and the only sort of consistency which they display is a consistent hostility to every proposal affecting them made by the Government of the day.

The action of the Scotch and Irish representatives during the past fortnight with regard to the business relating to their respective countries may be regarded as a fair specimen of the manner in which Scotch and Irish legislation is conducted. Wednesdays, during all but the two or three weeks at the end of the session, are always reserved for bills introduced by private members, and no Government measures are considered at the Wednesday sitting. A Scotch Wednesday is not invariably a lively day, but as a rule more of the work of law-making is got through on a Scotch Wednesday than on many days reserved for more ambitious work. The Wednesday before last no less than four Scotch bills were introduced by private members, and they were all disposed of after discussion. The Lord-Advocate was in his place on the Treasury bench, and during the greater part of the sitting he

was the solitary representative of the Government. But, thanks to the comfortable arrangement which, as I have said, is made outside the House, he had little difficulty in satisfying the promoters of three of the bills, and the fourth was—*haud invito* the Government—what is technically called "talked out," the rules of the House not allowing any business to be transacted after a quarter to six o'clock on Wednesdays. None of the four bills, it is true, was of first-rate magnitude, though one of them raised important questions relating to appeals in criminal cases, and another dealt with ecclesiastical matters that must very soon become urgent. But such as they were, they were disposed of at a single sitting of five hours' duration, and the Scotchmen were satisfied.

But what have the Irish members been doing during the same fortnight? A short bill of five clauses for the amendment and continuation of certain acts for the preservation of the peace in Ireland has been before them in committee, and they have actually consumed no less than nine protracted sittings on the consideration of this little bill. It was introduced by the Irish Secretary on the 1st of March, and, in the eyes of all but the Irish members, amply discussed on the motion for the first reading. The second reading was taken on the 23d of March, and again discussed at great length for two nights, no less than thirty-one of the Irish members taking part in it. On the 22d of April the discussion was resumed on the question whether the House should go into committee on the bill, and then it was that Mr. Biggar, the member for County Cavan, distinguished himself by talking and reading blue-books about Ireland for five continuous hours, and five valuable days have been given up to this wretched little bill since then in order to get its five clauses through committee. There is no novelty in the bill. It is one of those necessary measures which had their origin in the unsettled state of Ireland in 1847, and which, owing to the existence of Fenian conspiracies, Ribbon societies, and agrarian outrages, it has been found indispensable to continue from time to time The new provisions introduced into it are mainly of a conciliatory character, and are intended to relax some of the more galling restrictions contained in former acts of the kind which are still in force. The Irish members, however, or at least the Home-Rule section, made up their minds that something was expected of them, and they have fastened on this bill as a suitable occasion for a demonstration. A rumor was circulated that the Irishmen had placed forty-one amendments on the notice paper, and that they had resolved to divide on every one of them. As each division occupies on an average about twenty minutes, the prospect of nearly fourteen hours being given up to the mechanical routine of counting heads on forty-one foregone conclusions (the Irishmen were certain to be in minorities on every occasion) was more than the non-Irish members of the House of Commons could tolerate. Pressure was put upon those of the Home-Rulers who were supposed to be amenable to reason, and the threat of forty-one divisions was not carried out. No pressure, however, could be made to influence Mr. Biggar, and as he could not keep dividing he took it out in speaking. They have got nothing by all this The bill has passed committee and will soon become law, and then the Irishmen will find another grievance, and carry on similar tactics. It seems strange that they will not take a lesson from the "canny" Scotchman's book. A minority of an assembly of human beings constituted as the British House of Commons is can never get its way by irritating and vexatious tactics. I have often watched an ambitious man trying to force himself into office by persistently attacking the Government of the day and all the ministerial measures. Sometimes, if he is a strong man—a hard hitter and a skilful opponent—he succeeds. But where one man succeeds by hostility, twenty succeed by conciliation. A minority like the Irish members may force the Government hard at times when parties are equally balanced and the swinging of a few votes from one side to the other may turn the scale. But the present is not one of these times. The Government have a compact majority, and are indifferent to the Irish vote. Vexatious tactics, therefore, are useless just now. They merely waste valuable time and result in nothing. It is obvious to any one who thinks about it that in this Parliament the sagacious adaptability of the Scotch members is likely to produce more legislative fruits for Scotland than the ill-considered hostility of the Irishmen will produce for Ireland.

## A SOUTHERN PARADISE.

MELBOURNE, March, 1875.

I HAVE just returned from a visit to Tasmania. Americans probably know the island better by its old name of Van Diemen's Land, and connect it with traditions of the convict system. It is only natural they should do so; and yet to Australians of this generation the name carries with it hardly any associations except of a genial climate and great natural beauty. Politically, Tasmania is trying no experiments that are of any but the smallest local interest Commercially, the island for years back has been a failure. Even its natural beauty will not bear rigid examination, and has often been over-praised. Its hills will not bear comparison with the Blue Mountains of New South Wales, with the Mount Cook range in New Zealand, or even with the Gipps' Land Alps. It has no scenes of weird, fairy-like beauty such as the northern island of New Zealand boasts in its marble terraces and hot lakes and geysers. Altogether, indeed, it bears to New Zealand the same sort of relation that Devonshire or Kent bears to Switzerland. But precisely in this is its great charm for Australians. We are fanatically English, and Tasmania is not only the most English part of the antipodes, but is England glorified and transfigured—with virgin forests, with English-looking parks, farms, and cottages, with native growths of umbrageous fern-trees and gum-trees that match the mammoth trees of California, with gardens in which every fruit of Europe and every Australian tree will grow, with a summer that knows neither drought nor hot wind, with an autumn that is never laden with mist, with a winter in which snow never lies except on the mountain-tops. So far as my experience goes, there is no part of the antipodes that will match California for fruit; but I do not think California itself can show gardens equal to those of Tasmania. It seems to come midway between England and Australia, so that the plants which in England we have to shelter from the cold, and in Australia to roof-in from the sun, flourish here with rare luxuriance in the open air. Everywhere the eye wanders over bright tints in the distance. Here it is a scarlet hedge of geraniums, there a bower over which fuchsia has been trained, and here, again, English hawthorns growing wild, as gorse grows on the English commons. The plants of the Old World have invaded Tasmania as conquerors, and are rapidly driving out the native flora. In a walk up the spurs of Mount Wellington—the hill that overhangs Hobart Town—I recognized only one native plant, the tea-tree. English hawthorn, bluebell, pimpernel, and wild geranium were a perfect tangle at one's feet. I have said that I think Tasmanian landscapes have been a little over-praised. I must except Hobart Town, the situation of which is more like Bergen than any other place I know. With a background of high hills lying round it like the walls of an amphitheatre, with a splendid river sweeping past it on one side, and with a grand look-out from the spurs on which it is built over a broad bay studded with islands, Hobart Town may fairly claim to rank among cities of exceptional beauty. With a little energy on the part of its people, it would certainly be the queen of Australian watering-places; but Tasmania is the Sleepy Hollow of these latitudes.

If a critic of British colonial administration desired to make a special study of the colony in which its blunders had been most signal and disastrous, he would do well to consider the claims of Tasmania. The very settlement of the island was a mistake. The first founder had been sent to form a colony on what is now Melbourne. We in Melbourne are apt to think our climate and soil reasonably good, and our position above the average. But the British officer in command had been promised £525 compensation if he found it necessary to move, and he soon reported that the district of Port Philip was uninhabitable. This time the move to Tasmania was a final one, as the promise of compensation was not renewed. But Tasmania, like Port Philip, was considered part of New South Wales, and governed from Sydney, then distant at least a week's voyage. Naturally, the Sydney administration was not much troubled by the complaints of a handful of distant colonists, and treated their new dominion as a convenient home for refractory convicts. Under the wisest and best of governors this system could hardly have worked well. But colonial officials in early times were not generally either very wise or very good. O'Connell once told a political opponent that he had been guilty of conduct which must for ever exclude him from the society of gentlemen, and which ought to place him at the bar of a criminal court; "but," he added, "if you will abstain from contesting a seat at the present election, I will promise you an appointment in the colonies." Tasmania had its fair share of drunken, arbitrary, and dishonest men among its first administrators, but even the able and upright were forced to obey their instructions, and govern in the interests of Sydney and London. Accordingly, the fearful mistake of peopling a new country with convicts was nowhere so effectually carried out as in Tasmania. In 1846, out of a population of six thousand, about half were actual convicts, and at least a third of the remainder were old members of the criminal class. Of course, bushranging was an institution; and even in Hobart Town itself outlying houses were freely entered, not once and again, but time after time, by men who levied blackmail or at least helped themselves to drink. But the few desperate convicts at large were comparatively a light scourge The curse of the island was in the system that entrusted coarse and brutal men with almost absolute power over the convict class, and encouraged in-

formations, perjuries, and crimes committed to be imputed to others. Years after the system of transportation had been abolished, the "convict taint" was still rife in every class of society; and servants, depraved by early association, carried suggestions of vice, dishonest ways, and foul language into quiet and respectable households.

Happily for mankind, time and free institutions are wonderful purifiers. One of the worst evils of the convict system—the disproportion of women to men—had at least this qualifying result: but comparatively few convicts founded families. Many escaped to Victoria at the time of the diggings; the remainder have settled down, and are now, in the second generation, mixing freely with the descendants of free immigrants. There is still some recollection of the old times. I have heard a drunken woman boast that she paid her own passage out, but it is no longer thought necessary to add the triumphant legend, "came out free," to epitaphs, and I have noticed that the richer classes are not as careful as in Sydney to avoid all allusion to convict days. In a very short time, a few local names that commemorate famous bushrangers or their exploits will be the chief memorial of the old régime. But the most marvellous of all changes is the transformation of a whole people, so largely tainted with crime, into one that will compare favorably with most for decency and the absence of grave offences. A tourist in Tasmania sees here and there a markedly repulsive face, which he sets down—rightly, no doubt—to descent, at least, from villanous progenitors. But generally he can only say that the Tasmanians are rather shorter, squarer, and chubbier than the Australians of the mainland, and perhaps more stolid and less intelligent-looking—in a word, more British. One may account for this in several ways. There is no doubt that the free emigrants by whom Australia has been mainly peopled are the pick of the British population, and there seems reason to think that our warm climate adds an inch or two to their stature in a generation. In fact, the colonial-born in New South Wales are currently distinguished as "corn-stalks." In manner the Tasmanians have a little more of the old-country deference for superiors than is found in Melbourne or Sydney. The first settlement of the country in more conservative times will account for this. In morals, strange to say, they stand well. There is, indeed, some pauperism; and here, as everywhere else in these parts, there is a class of disorderly boys and young men—"larrikins," as we call them—for whom the want of a sound school system is mainly responsible. But crimes of violence are almost unknown, and other offences not inordinately above the English average. In a word, the country is not yet in the millennium, but life and property are safer there than in many long-established communities. With better schools, which they are now introducing, and a few years' more exemption from disturbing causes, civil war, or gold-fields, the Tasmanians may probably rank high among respectable societies. Such a result seems to me very remarkable. No doubt, many of the prisoners sent out were nothing worse than poachers or political rioters; still, they graduated for freedom in bad companionship and under bad treatment, and no man could much have wondered if the island had been a nest of thieves and ne'er-do-weels to this day.

I was sorry to miss the U. S. frigate *Swatara*, which had brought over the party charged to observe the transit of Venus. Its officers and scientific men, especially Professor Harkness, won golden opinions during their stay from the Tasmanians, and I hope will take back a good report of colonial courtesy and hospitality.

# Correspondence.

## LIFE-INSURANCE COMMISSIONS.

To the Editor of The Nation:

Sir: In your No. 516, pp. 346, 347, you express certain views on the subject of life-insurance agents which do not seem to me so well grounded as your opinions generally are. The case stands thus: Of the moneys paid by the public for life insurance, a certain percentage—I shall probably be below the truth in saying ten per cent.—never reaches the companies at all, being kept by agents as commission, and in consequence, on the average, every one gets ten per cent. less insurance than his premiums would buy him if the company could only get the full amount. That this is a great evil, if not a flagrant abuse, every one except agents, the companies included, agrees. That such an evil is irremediable I should be very sorry to see you maintain. In the article which you do me the honor to call attention to, I remarked that the companies' own members were its natural soliciting agents. At this you smile, likening it to the appeals of a newspaper to its subscribers to increase its circulation.

I might ask in reply to this whether the good opinion of a paper entertained and expressed by its readers is not really the way in which the circulation of good newspapers is most effectively extended. But a very important point which you seem to overlook is that the members are themselves the shareholders of the company and the sole parties interested. To make the case of the newspaper a parallel one, the subscribers appealed to ought to be themselves the shareholders, who had put money into the enterprise, and were interested in having their neighbors do the same.

To the large majority of "practical men" a nearly conclusive argument in favor of my views is that they have been put into practice with entire success. The following English companies have ceased the payments of commissions, and the result has been a diminution of the percentage of expenses to receipts which I wish all your readers would learn by heart and compare with the percentage of the best of our own companies. I took some pains to collect the figures when in London last winter:

| | Ratio of expenses. |
|---|---|
| Equitable, of London | 2.3 per cent. |
| London Life Association | 2.8 " " |
| Clergy Mutual | 3.4 " " |
| Metropolitan | 3.4 " " |
| National Life | 8.6 " " |

I think you misapprehend what it is necessary the members should do to forward the interests of their companies. They need not go from house to house. Thirty years ago it would have been necessary. But the subject of life insurance is now one so widely discussed that the field for solicitors is rapidly diminishing. From what I have seen, I do not think that half those who now insure their lives do so in consequence of the solicitation of an agent. Having made up his mind to insure, a man enquires among such friends as he supposes to be informed about the relative standing of companies. He then visits the agents of those of which he hears the best accounts, gets pamphlets setting forth the dozen or more peculiar and advantageous features of each, and finds that between the three or four leading companies of the country there is very little choice. It seems to me that all that is required is that every member of the company first dispensing with the payment of commission shall be able to say to his neighbor, when his opinion is asked: "My company can give you ten per cent. more insurance for your money than any other company can, because there is no agent between you and it to deplete your premium."

Yours very respectfully, Simon Newcomb.

Washington, May 22, 1875.

## NEW HAMPSHIRE POLITICS.

To the Editor of The Nation:

Sir: As recent transactions in this State are just now the subject of much newspaper comment and discussion all over the country, largely based upon misstatements of facts and ignorance of the laws applicable to them, I venture to ask space in your journal for a brief presentation of the case on the part of the Democrats of New Hampshire. The love of justice and independence of the *Nation* can well afford this, since the vigorous pen of its editor is free to combat our views and action if they do not accord with its sentiments.

Our Constitution provides that the votes cast for senators in the several districts shall be returned to the Secretary of State by the clerks of the several towns, and that in due time the Governor and Council shall examine the returns and issue certificates to those who appear to be elected. Their action in this matter is subject to review by the Senate when organized, under the provisions making that body the "final judges of the elections, returns, and qualifications of their own members." The Constitution also provides that, to be eligible to the Senate, a man must be an inhabitant of the district for which he is chosen, and must have been an inhabitant of the State for seven years immediately preceding his election. An absolute majority of votes is required to elect. We have a statute in relation to elections which reads as follows: "The full Christian and sirname of every person voted for, with the initial letter or letters of the middle name, and the usual abbreviations of junior, second, third, and the like, shall be written or printed upon every ballot, and every ballot not thus prepared and cast shall be regarded as a blank and not counted." These are all the provisions of our Constitution and laws upon the subject; and, keeping these in mind, I ask the reader to give his attention to a brief statement of the facts of the case.

The returns of the votes for senators were duly laid before the Governor and Council, and upon examination they found ten senators whose election was unquestioned, five of each party, while in the other two districts (the

Second and Fourth) the returns were as follows: In the Second District, James Priest (Democrat) had 3,834; Natt Head (Republican) had 3,771; and there were 101 for other persons. In the Fourth District, John Proctor (Democrat) had 3,495; George E. Todd (Republican), 3,457; Arthur Deering and others, 64.

In regard to the Second District, objection was made to counting the votes returned for Natt Head on the ground that the votes were avowedly intended for Nathaniel Head, and as they did not have on them "the full Christian name of the person voted for," they must "be regarded as blanks, and not counted," as provided by the above-quoted statute. It appeared that Head was named and christened Nathaniel; that his name so stands upon the check-list of his town, and he voted upon it last March; that by ballots bearing that name he was chosen moderator of the town-meeting of his town last March, and that by that name he has always been voted for and elected to various offices in his town, and never by any other. Therefore, by the provisions of the law above quoted, the votes cast for him in the name of Natt Head were void, blanks, when they were put into the ballot-box, and their reception and return to the Secretary of State could not give them life and legality—they were void and blanks still, and the Governor and Council had no alternative but to so treat them. Those votes did not bear "the full Christian name" of Nathaniel Head, but an abbreviation—just what the statute was avowedly passed to prevent the use of in voting—and, in strict compliance with the letter, spirit, and purpose of the law, those votes were "regarded as blanks and not counted," and Mr. Priest was declared elected.

In the case of the other (Fourth) District, it was objected that the votes for Mr. Deering and several others, about sixty in all, should be rejected on the ground that those men were ineligible to the office of senator for lack of the qualifications of residence. The ineligibility was undisputed. It was argued that votes for ineligible persons are void, and they are always so regarded in elections by the legislature; and the Governor and Council so regarding them in this case, Mr. Proctor had a majority of legal votes, and was therefore declared elected.

Here is the whole case, the law and the facts in brief. In their decisions the Governor and Council were fortified by the opinions of many of the ablest lawyers of the State, of both parties, including two Republican ex-judges of the Supreme Court, who had fully investigated the grave questions involved.

It is objected that the Governor and Council had no jurisdiction in the matter; but upon this point the opinions of lawyers are quite as emphatic in support of the executive as upon any other, and we regard it as beyond serious doubt. It is said that the decisions, especially in the case of Head, are based upon a mere technicality—that the intention of the voters was evident and should have been regarded. To this we reply, that the statute requires that the intention of the voter shall be manifested in a particular manner, and emphatically declares that if it is not so manifested it shall not be regarded; and it is perfectly evident from the facts of the case which induced the enactment of the statute that such was the intent of the legislature in passing it. In further reply to this objection, we say that the men now declared elected were the choice of the people of their districts, but were placed in a minority at the polls through frauds, and they saw no other way of securing their rights except by a resort to this method.

But it is sufficient to say that the Governor and Council were bound by the plain letter of the law, which they could not ignore or disregard in the face of the facts and opinions before them. And we hold their action to be right, and believe that, in spite of the unparalleled partisan malignity it has evoked, it will be fully sustained by the people of New Hampshire and by the sober second thought of the country.

Yours truly,

WM. BUTTERFIELD,
Secretary of State.

CONCORD, N. H., May 24, 1875.

## GERMAN DIPLOMAS.

TO THE EDITOR OF THE NATION:

SIR: It is very gratifying to those holding German diplomas to read your correspondent's letter on that subject, published in the last issue of the *Nation*. The ordeal at Leipzig is, however, different from that at Heidelberg, and is as follows: The candidate must first present certificates of his whole course of instruction, from the time he learned the alphabet down to the day he presents his application for the doctorate. His technical course is to cover a period of ten semesters. If his character and credentials are acceptable, he is required then to write an original dissertation on any subject (chosen by himself) that may lie within the range of his profession. This is duly deliberated upon by the Faculty, being passed from one to the other until each has read it; this requires from fourteen days to three weeks alone. The dissertation being declined, the matter ends there. If, however, the candidate is so fortunate as to have his work meet the approbation of the Faculty, he is then admitted to a rigorous examination, appointed a week or ten days later, in the following branches (supposing him to be a candidate for the M.D. degree): anatomy, microscopical, comparative, and general; physiology, general and special; general and special pathological anatomy, general and special surgery, general and special medicine, obstetrics, ophthalmic surgery and medicine, diseases of children, diseases of women, materia medica, etc. The physician's examination at the end of the first two and a-half years embraces all the elementary branches, such as botany, chemistry, physic, zoölogy, etc.

It is supposed by Americans to be a very easy thing. One of these gentlemen went to Munich to pass in medicine last year, wrote *acne* "*agne*," and fell through.

Your obedient servant,

GEO. HALSTED BOYLAND, M.A., M.D.,
Laureate Leipzig Medical Faculty; late Surgeon French Army, etc.

BALTIMORE, May 22, 1875.

TO THE EDITOR OF THE NATION:

SIR: The private letter printed in the last number of the *Nation* cannot fail to interest a large circle of readers, especially the *philosophiæ doctores*, past and prospective. These latter it might be well perhaps to inform that the ceremonies in getting a doctorate are not identical, though similar, in all German universities. Some, as for example Berlin and Leipzig, make a printed dissertation on some topic in the *Hauptfach* (principal subject) a *sine quâ non* in obtaining the Ph.D., and more stress is laid upon this than upon the examination proper. This dissertation is permitted but not required by the Philosophical Faculty of Heidelberg.

My object in addressing you, however, is to correct the Heidelberg "tradition," of which the author of the letter speaks, that no American hitherto has secured the *summa cum laude*. A most remarkable case occurred some six years ago, when an American, who was entirely deaf, obtained this first degree. He learned his German by reading from the lips of his teachers, and acquired his knowledge of the lectures of Professors Bunsen and Kirchoff in the same manner. PH.D. (Lips.)

ANN ARBOR, May 22, 1875.

[Another case has been reported to us of a graduate of Harvard (1868), who took the degree of Ph.D. *summa cum laude* in the subjects of chemistry, physics, and mineralogy the following year at Heidelberg, and another degree *summa cum laude* in 1871, at Berlin, as mining engineer.—ED. NATION.]

# Notes.

J. SABIN & SONS are about to reproduce in exact facsimile Cruikshank's 'My Sketch-Book.' A few copies will be printed on India paper.——L. W. Schmidt sends us the first number of *Hallberger's Illustrated Magazine* (Stuttgart and Leipzig). It is a large octavo of fifty-six pages, half of which is occupied with Miss Braddon's "Hostages to Fortune." Another story, "Jeanette," is from *Scribner's Monthly*, but, on the whole, the selections suggest an English rather than an American audience.——The *Athenæum* states that the 'Unseen Universe' is the joint production of Professors P. Guthrie Tait and Balfour Stewart, of Edinburgh and Manchester respectively.——The London *Bookseller* for May gives a useful list of literary pseudonyms from the time of Sir Walter Scott. We notice a few errors in the American portion: *Mrs.* L. Redden ("Howard Glyndon") and *Mrs.* Mary Dodge ("Gail Hamilton") instead of Miss; *O.* K. Philander Doesticks for Q. K. "Bret Harte" is set down as the pen-name of an author we never heard of before—C. B. Hart. It is, of course, a real name. The late J. C. Hotten figures prominently in this list, with four pen-names.——One of the economies of the newspaper business is shown in a copy of the *Evening Telegram* of this city for May 8, extra edition of 11.30 A.M. The only news of the day it contains is the wreck of the *Schiller*. This appears on the first page, which is otherwise made up of the despatches of the day previous. The remaining three pages bear date of March 18.——The revival of the University of Pennsylvania begins to have its natural effect on

a rich and public-spirited community. The late John H. Towne, who died suddenly in Paris, bequeathed $10,000 to the Hospital connected with the University, the same sum conditionally to the Academy of Natural Sciences, and $5,000 to the Academy of Fine Arts, and made the University his residuary legatee for an amount estimated now at $300,000, and eventually by reversion at nearly a million. The money is to swell the endowment fund, and the income to be applied solely to the salaries of instructors in the scientific department. Mr. James Lick's numerous gifts to the people of San Francisco appear to have been bettered by his temporary revocation of the trust. The most eccentric one, viz., the monument to the author of the "Star-spangled Banner," has been reduced nearly two-thirds from the original provision ($150,000).——The announcement that the school at Penikese will not be opened this season for want of support will cause general regret. We hope that before another year elapses the several State boards of education will have induced their legislatures to found scholarships, as proposed by the directors, for the benefit of teachers desirous of enjoying opportunities nowhere else obtainable for the trained study of natural history.——*O Novo Mundo* of May 23 prints by arrangement with the *Tribune* one of Arsène Houssaye's letters to that paper in the original.

—We fell into an error last week in saying that Father Gerdemann, on his late trial in Philadelphia, was acquitted by a disagreement of the jury—ten against and two for him. These figures should have been reversed. In other respects, we believe we did him no injustice.

—The prose of the *Atlantic* for June is very readable. Besides a number of minor articles which we have not space to notice, there is a chapter of Mr. James's novel, 'Roderick Hudson,' which is perhaps the best instalment yet of a novel sure to attract a great deal of attention when it appears in full, and which indeed is doing so already. An article on "Wise and Unwise Economy in Schools," by Mr. C. W. Eliot, which we have discussed elsewhere, deals with a subject perhaps the most important of any before the public. Mr. Lowell's "Ode read at the Concord Centennial" is likely to be the most permanent memorial of the day, and to be read a hundred years hence with as fresh an interest as that with which we read it now. Mr. Lowell is a master of poetic form, and shows in this, as in his noble Commemoration Ode, the apt union of art with inspiration. The Ode is a pœan to Freedom, but there is no Fourth-of-July exuberance and conceit in Mr. Lowell's celebration of her. The Freedom that he sings is that which dwells with knowledge and with duty.

> "Freedom, not won by the vain,
> Not to be courted in play,
> Nor to be kept without pain."

The poet becomes the voice of the better spirit of the community, and his imagination presents in concrete forms the vague popular ideals. Such high, inspiring, manly poetry as this is a permanent addition to the spiritual treasures of the nation. The *Atlantic* opens as well as closes with an ode. Mr. Aldrich calls his piece "Spring in New England," and he shows himself in this, as in much of his previous work, an excellent artificer in verse. He has skill and knack, and there are some pretty touches in this ode, which is not, as its name might imply, merely pastoral, but is in effect an elegy on the graves of our dead in the South. But what is the meaning of

> "On obelisk and urn
> Shall the myrtle's *azure burn*"?

Mrs. Thaxter and Mrs. Moulton have each a contribution of the sort appropriate to the magazine, and Mr. Edgar Fawcett prints a morbid copy of verses on "Waste," which is by no means up to the level of his exquisite little poem called "Immortelles" in the last number. Mr. Fawcett ought to be a more severe critic of his own verse. The most noticeable poem in the magazines for June, after Mr. Lowell's, is a long piece called "The Symphony," by Sidney Lanier, which appears in *Lippincott*. It is fluent, fanciful, and sweet, not over-sensible, and hurt by mannerisms both of expression and sentiment, some of which seem to be original and some caught in Mr. Morris's school. But it is better than most magazine verse, and is worth reading for the sake of the fancy it displays. In *Harper*, Mr. Aldrich reappears with a clever little sketch in verse, called "In an Atelier." It is bright but crude, and the absence of delicacy, both of touch and of sentiment, spoils the effect of what might have been a pleasant piece of liveliness. The other verses in *Harper* for this month are, we may say, for those who do not read poetry or do not care to read it. The editor of *Scribner* exhibits a kindly consideration for its readers by affixing to the titles of the contributions in verse in the contents the word "Poem." There are six such pieces in the June number; none of them is of great importance.

—In his Concord Ode, Mr. Lowell, speaking of the presence of Freedom in the "low village of the plain," says:

> "She loves yon pine-bemurmured ridge
> Where now our broad-browed poet sleeps,
> Dear to both Englands; near him he
> Who wore the ring of Canacë."

All his readers may not at once recognize that in these words Mr. Lowell calls up the memory of Hawthorne and Thoreau; nor will all understand the reference to the ring of Canacë. In Chaucer's 'Squyere's Tale' we are told how the King of Araby and Ind sent marvellous gifts to King Cambynskan on his birthday, and with them a ring for my lady Canacë, his excellent daughter:

> "The vertu of this ryng, if ye wol heere,
> Is this, that whoso lust it for to were
> Upon hir thomb, or in hir purs to bere,
> There is no foul that fleeth under the heven
> That sche ne schal understonden his steven,
> And know his menyng openly and pleyn,
> And answer him in his langage again;
> And every gras that groweth upon roote
> Sche schal eek know, to whom it wol do boote,
> Al be his woundes never so deep and wyde."

In a familiar passage in the 'Penseroso' Milton refers to the ring:

> "Or call up him that left half told
> The story of Cambuscan bold,
> Of Camball and of Algarsife,
> And who had Canacë to wife,
> That own'd the virtuous ring of glas;
> And of the wondrous horse of bras
> On which the Tartar king did ride."

—We spoke some weeks since in these columns of the successful and, in some respects, brilliant revival of "Henry V." at Booth's Theatre, and of the merits of Mr. George Rignold in the only part in the play which admitted of much acting. The management having found that Shakspere could be made to pay, and having Mr. Rignold still in hand, have lately been offering "Macbeth"—by no means with the same splendor as the other play, but with some pretensions to care and completeness. Is it to be accounted an additional resource that they have also had the services of Miss Clara Morris? From an at all exacting point of view, we think not. It is one thing to make a great hit with Shakspere in a case where much spectacle will carry off little acting, and another thing to succeed where, whether the spectacle be much or little, the acting must not in decency fall below a certain level. Mr. Rignold had immense good fortune with the part of Henry V, which seemed to give him a chance to do all he could, and to ask of him nothing that he could not. With Macbeth he stands on different ground, and he stands much less firmly. He has great good-will, and good looks and good taste, such as prevent him from ever being disagreeable; he is what is called "sympathetic"; one rather likes him, even in his weaker moments, and one has a sort of sense of friendly relief in witnessing his stronger ones. But the part is too large for him, and he does not in the least fill it out; he occupies at best, now here, now there, an outlying corner of it. He desires to be natural and real—a most laudable ambition; but there is reality and reality. When you have Shakspere's speeches to utter, your reality must be a sort of imaginative compromise; you must wind your whole conception up to a certain exalted pitch, and there, at that impressive altitude, you may keep among the levels. Mr. Rignold is best when he has a chance for movement and violence, as in the scene with Banquo's ghost at the banquet. In passages of pure declamation he is ineffective; he gave such speeches as the "Duncan is in his grave," etc., quite without richness or resonance. He is an actor who probably can do certain parts so very well that it is a pity to see him doing certain others but half well. It is to be supposed that there are some things that Miss Clara Morris can also do well; but the utterance of the tremendous speeches of Lady Macbeth is not one of them; to speak frankly (this is a case for it), the disparity between the actress and the part was simply ludicrous. Miss Morris's meagre voice, her vulgar intonation, her trivial conception of her opportunities, are all fatal disqualifications. Every speech seemed to us distinctly missed, and the actress's facial play and the introduced business of her own invention struck us as an insufficient compensation. This is not harsh criticism. Miss Morris, it seems to us, has a large reserve of good fortune to draw upon in finding it so easy to display her incompetence on an eminent stage. The truth is, no artist need expect to play parts demanding style and elevation in this familiar juxtaposition and alternation with the "realistic" drama of the period. Realism is a very good thing, but it is like baking a pudding in a porcelain dish; your pudding may be excellent but your dish gets cracked. An actor who attempts to play Shakspere must establish for himself a certain Shaksperian tradition; he must make sacrifices. We are afraid that as things are going, most actors find it easier to sacrifice Shakspere than to sacrifice to him.

—The regular spring exhibition of the Brooklyn Art-Association contains the interesting painting of "Corinne," by Miss Gardiner, intended for and catalogued with the exhibition of the Academy of this city, but delayed in Paris until too late to be hung.; it is an elegant, chilly bit of classicism. Other noticeable pictures are Yewell's richly-colored representation of the Senate Chamber in Venice (180), the Gothic Mountains (73) by A. Parton, the "Golden Hour" (325), by William Hart, a "Landscape at Queens, L. I." (296), by C. H. Miller, a "French Village" (197), by Mrs. Coman, and some attractive foreign paintings lent by their owners, such as Julius Breton's "Peasant Girl" (347), Merle's "Nursery Tales" (1), and Guillaumet's "African Landscape" (302).

—A pleasant notice in the London *Times* on 'International Playing-Cards' published by De la Rue & Co., affords several curious particulars which may bear repeating. These cards were recently devised by "Felix Summerly" (Sir Henry Cole, K.C.B.) and elaborated with the aid of Mr. Reuben Townroe, an artist whose designs for the ornamented terra-cotta work on the exterior of the Royal Albert Hall and many decorative works at South Kensington Museum are of a high and original character. The cards have the appearance of the modern stereotyped form, adopted from the French cards made at Chartres in 1702, but on closer inspection we find the Prince of Wales doing duty as the King of Diamonds, the King of the Belgians as the King of Hearts, the Crown Prince of Prussia as the King of Spades, and the King of Italy as the King of Clubs. The aces in this new issue are allotted to the greatest potentates; thus, Her Majesty, as Empress of India and Queen of the United Kingdom, appears as the Ace of Hearts, the President of the United States as the Ace of Spades, the Emperor of Russia as the Ace of Diamonds, and the German Emperor as the Ace of Clubs. By an irreproachable compliment the high office of Queen of Hearts has been allotted to the Princess of Wales, while to the Crown Princess of Germany is assigned the dignity of the Queen of Clubs; the Queen of Greece appears as Queen of Diamonds, and the Empress of Austria as Queen of Spades. The four knaves have a more original character about them than the other Court cards. A Scotch piper with distended cheeks, vigorously blowing his pipe, and with the utmost determination of purpose in his features, is presented as the Knave of Hearts; an officious and splendid functionary, obviously a gendarme, is the Knave of Spades; a yellow-bearded Swiss guide, with his rope over his shoulder, and clenching a spiked staff, is the Knave of Clubs; while Spain is represented by a keen-eyed and carefully-coiffed matador as Knave of Diamonds. The portraits of the principal personages are pronounced successful.

—Cards have not been the vehicles for portraiture only. In England, during Charles II.'s reign, a pack of cards was issued by Randal Taylor, near Stationers' Hall, which was purchasable from most booksellers at one shilling per pack, "forming a history of all the Popish plots that have been in England, beginning with those in Queen Elizabeth's time, and ending with the last damnable plot against His Majesty Charles II., with the manner of Sir Edward Godfrey's murder." Other cards relating to heraldry, geography, history, politics, grammar, sciences, etc., were also published, but, except for the insertion of the well-known heart, spade, club, or diamond, the designs might have been merely little pictures. On the cards, of an earlier date, in 'Ottley's Etchings by Early Masters,' the usual symbols are supplanted by swords, goblets, fruits, trees, etc. In Germany, hearts, bells, leaves, and acorns were generally adopted; in Spain, swords, cups, batons, and coins prevailed as devices for cards. Besides cards printed from etched steel and copper plates, wood-blocks, and by lithography at South Kensington Museum is a pack of silk-embroidered cards. A pack of white-metal engraved cards was also shown at the Museum. The date of the first use of cards is not to be exactly ascertained. Poupart, the Treasurer of Charles VI. of France (close of the fourteenth century), made an entry in his accounts of certain "*jeux de cartes*." In 1387, an ordinance is said to have been issued by John I., King of Spain, against card-playing; while in 1379 the gambling which arose from cards in Italy is recorded by Feliciano Bussi, in his 'History of Viterbo,' as having caused much distress; the game, it is said, "comes from the country of the Saracens, and is with them called *Naib*." M. Boilleau d'Ambly quotes Court de Gébelin, an antiquary of note in the last century, to support his opinion that cards were first imported into Europe by the wandering tribes who migrated from Mongolia and settled in large numbers in Bohemia. As early as 1120 the Chinese had a certain kind of cards for gambling purposes. Breitkopf, who has written on the subject of cards in a masterly manner, considered that there was a self-evident affinity between chess and cards. Chess is of Oriental origin. The game of the four kings or Chaturagi or Chartur Nawaub is similar to chess. The employment of the four kings with other minor elements of this game suggests cards; and it may be a question if the word "card" be not in its technical sense derived from *chartur*, the Hindu word for four. In its ordinary sense, its etymology from *carta* or *charta* is obvious. But there are other considerations which to a great degree may be held to support the theory of the Hindu etymology.

—F. W. Christern sends us, in four superb quarto volumes (nominally two), the complete 'Dictionnaire de la Langue Française' of M. Littré. No scholar is ignorant of the merits of this remarkable work, which is of the same order of genius as that of Sainte-Pelaye, and which has been eleven years in passing through the press. We shall seek an early occasion not to praise it, but to give some idea of the plan and execution of it. While no public library should be without it, and no student of French who aims at something more than a superficial acquaintance with the language can well dispense with it, its costliness puts it beyond the reach of many. We are glad to meet, therefore, the announcement of Hachette et Cie. that an abridgment of Littré is already well advanced, and has begun to appear in weekly parts. There will be twenty-five in all, selling in France at fifty centimes each, which ensures a moderate price for the entire work (1,300 pages 8vo). The editor is Prof. Beaujean, who was M. Littré's invaluable colaborer in preparing the great dictionary for publication, and who is pre-eminently qualified for the task of making an abridgment with knowledge and discretion. The smaller work will still contain 8,500 words more than the Academy's dictionary (the words not found in the latter being marked with an asterisk); it will indicate the pronunciation in difficult cases and the etymology always, but without discussing it; the definitions will follow the order of natural development observed in the larger work, but examples will be cited only by way of helping out the definition, or to support a questionable signification with respectable authority. Finally, the old Gallicisms, figurative expressions, and proverbs, which so abound in the larger work, will all be retained in the abridgment.

—Another work also just begun by Hachette et Cie. is noticeable for its magnitude as well as for its intrinsic worth. We refer to the 'Nouvelle Géographie Universelle—La Terre et les Hommes' of M. Élisée Reclus, who has been happily spared to science. The author describes it in his prospectus as a sort of specialization of his general survey published some years ago under the title of 'La Terre.' It will deal with the several countries of the earth in such a way that one may purchase separately the volume which particularly interests him. Its five hundred parts, selling at fifty centimes each, will make ten or twelve volumes of the best French workmanship, illustrated by more than 600 wood-engravings, and containing in the text some two thousand maps, of a kind not found in atlases. Volume I. will embrace Mediterranean Europe. For the special student of geography we may mention here an African bibliography which has lately appeared in France. The full title, as given in *Polybiblion*, is: 'Bibliographie des ouvrages relatifs à l'Afrique et à l'Arabie; Catalogue méthodique de tous les ouvrages en langues étrangères traitant de la géographie, de l'histoire, du commerce, des lettres et des arts de l'Afrique et de l'Arabie'; the compiler, Jean Gay. In 312 pages octavo, 3,696 titles are recorded, and there are frequent notes of authors and works which are as readable as they are instructive.

—Baron von Richthofen had been misunderstood by the Abbé Armand David, the eminent French naturalist and traveller in China, to hold the opinion that the population of that country did not exceed one hundred millions. He took pains, therefore, at the January meeting of the Berlin Geographical Society, to disclaim this opinion and to set forth in some detail his reasons for maintaining the credibility of the general results of the Chinese census. He began by explaining the causes which tended towards an under-enumeration—an evil fully recognized in the penal laws, while the opposite contingency is not contemplated. When the known objects of the census were the imposition of a poll-tax and the conscription of the male population for socage and military service, there was every inducement for the people to avoid being fully numbered, and for the officials to reap the reward of connivance in the fraud. In passing through the several grades of these gentry, the population and tax receipts fell off *pari passu*, with the effect of enriching the officers at every stage by the exact difference between the figures reported to them by their subordinates and those reported by them to their superiors. This state of things prevailed till 1711, when the Emperor Kanghi converted the poll-tax into a ground-tax, and gave out as the special aim of the census the equal distribution of the state's benefactions in case of famine or scarcity. For the first time the people had a motive for being counted to the full, and an over-count might have ensued but for the continuance of the conscription already mentioned. That the latter consideration (perhaps added to a lack of con-

fidence in the sincerity of the charitable pretext) outweighed the former, and that the total of 28,605,716 obtained by this census was too small, is to be inferred from the progressive increase of subsequent censuses, beginning with 177 millions in 1749—an impossible increase over the former figure, and yet in harmony with the results of subsequent censuses, viz., 284 millions in 1783, 362 in 1812 (especially trustworthy, says Richthofen), and 415 in 1842. The density of population is on the average 5,500 to the square mile, or very nearly the same as that of Great Britain, but very much more unevenly distributed; in places it amounts to upwards of 30,000 to the square mile, exceeding even that of the Ganges delta. The year 1842 marks the close of a long period of peace and the beginning of a marked increase in the use of opium. These causes have prevented the normal increase of the population to some 500 millions, as may be estimated in the absence of any published census since 1842. The frightful intestine wars reduced the inhabitants by millions—the Tae-ping rebellion alone destroying no less than 30. That such destructiveness is not incredible is apparent to any traveller through the now deserted, once thickly-populated regions, in which whole cities were put to the sword, as, to take the latest example, at Tali-fu in the province of Yunnan, the seat of the Mohammedan rebellion. As regards opium, Baron Richthofen makes the suggestive remark, that if the effect of this drug in diminishing the reproductiveness of the Chinese were ascertainable, we could determine the surplus available for the populating of other parts of the world—a surplus which, if there had been neither wars nor opium, would already have become an almost irresistible flood. He concludes that a safe estimate of the present population of China is 420 millions. The total assigned it in Behm and Wagner's 'Bevölkerung der Erde,' just come to hand (*Ergänzungsheft* No. 41 of Petermann's *Mittheilungen;* New York: L. W. Schmidt), is 404,950,000.

## MR. GREG AND HIS WARNINGS.*

WHY is Mr. Greg doomed to perform the part of Cassandra? He has many gifts which ought, it would seem, to make him not only an impressive but a successful teacher. He has devoted his life to speculation. He combines the experience of a man of the world with the training of a thinker. He can express his thoughts in a forcible style, and his thoughts are always worth attention. On the subjects, moreover, of which he writes he is full of information, and hence avoids that special failing of so-called thoughtful writers which consists in the attempt to make ingenious speculation do the work of accurate knowledge. But in spite of all these, and of some other excellent qualities, Mr. Greg is, by his own admission, a prophet whose warnings pass unheeded by a perverse generation, who buy and read his works, and then live on without one serious thought of the "rocks ahead" on which (if the man at the mast-head is to be believed) not England alone, but every civilized community may make shipwreck. What makes Mr. Greg's failure the more remarkable is, that few will care to dispute that the dangers pointed out in "the warnings of Cassandra" are, whatever their extent, real perils. No one acquainted with the municipal government of this city, for instance, will deny that universal suffrage is compatible with gross misgovernment. No one who observes the present condition of France will question that a divorce between intellect and religion is both a possibility and, when it takes place, a grave national calamity. What, then, is the weak point in Mr. Greg's teaching which deprives it of at least half its effect?

No amount of general reflection could suggest so easily the reply to this enquiry as do the following sentences from a letter in which the author of 'Rocks Ahead' replied to an opponent who advocated in moderate terms the possible utility of trades-unions. "I believe," wrote Mr. Greg, "it may be stated as a rule, almost if not quite without exception, especially in the great industries, such as coal, iron, cotton, etc., that *whenever disputes between masters and men culminate in a 'strike,' the workmen must be in the wrong*, for the simple reason that the inevitable loss to the masters consequent upon a stoppage of their works is so grievous, and in the case of coal mines and blasting furnaces so *enormous*, that no man will face it if he can afford to give way to the demands of his workpeople."† Now, this passage (the italics are Mr. Greg's) is remarkable, not so much for the statement it contains as for the picture which it gives of the writer's turn of mind and mode of reasoning. The main doctrine which it is intended to enforce, namely, that the benefits derived by artisans from strikes and trades-unions are open to grave question, is probably true, and it is characteristic of the best side of Mr. Greg's intellect that he maintains this position with unflinching boldness and in unmistakable terms. It is, however, equally characteristic of his weak side that he cannot for a moment occupy the position of an impartial theorist, and that he obtains a momentary intellectual triumph by the use of a "simple reason" which is quite inadequate to support the conclusion which is founded on it. The one-sided unfairness of a writer who can honestly assert that the "workmen are always in the wrong" hardly calls for observation. Such assertions are simply a vehement mode of contradicting the equally absurd dogma that "workmen are always in the right." The inadequacy of the "simple reason" is a much more noticeable matter. It assumes, in the face of the best-known facts both of experience and of human nature, that men can be relied upon to act solely on the view of their immediate material interests. The impossibility of conceding to an unreasonable demand, the calculation that concession to-day will lead to encroachment to-morrow, the dislike to dictation, class feeling, or the mere combativeness engendered by opposition—a hundred other motives, good, bad, and indifferent, lead either capitalists or laborers to rush into one of those industrial battles which are known as strikes. To say that such a strike must, like any other combat, necessarily involve loss to both sides, and ought, whenever it is possible, to be avoided, is to assert an obvious truism. To point out that workingmen are specially liable to misunderstand the conditions of the conflict, to overestimate the possible gain and underestimate the certain loss, is to reiterate the truth constantly in danger of being forgotten; but the assertion that either one side or the other must of necessity be "always in the wrong," is to make just one of those fallacious statements which, from being the exaggeration of a limited truth, are at once irritating and unconvincing, and exhibit a narrowness of mind on the part of writers who, like Mr. Greg, try to solve complicated problems by the lucid exposition of some utterly inadequate "simple reason."

The belief in "simple reasons" is indeed a feature of Mr. Greg and of the school of political economists to which he belongs. The greater writers on political economy never forget that the object of that science is to trace what are the results which ensue *in so far* as men act on motives of obvious self-interest. The inferior exponents of economical doctrines fall insensibly into the belief that men do invariably act on principles of immediate self-interest. From this error Mr. Greg is certainly not free, and he combines with it (not unnaturally) a tendency to believe that what is needed to carry conviction to opponents is simply the vigorous statement of obvious truisms. Hence the habit of confusing strength of assertion with force of argument, and of constant indulgence in the rather offensive dogmatism of assured common-sense. In none of his later works are Mr. Greg's weaknesses more visible than in 'Rocks Ahead.'

His first rock is the danger of modern and especially of English society from the political supremacy of numbers. He proves, what scarcely needed proof, that the majority of every community must necessarily be ignorant and uninstructed. He further proves, what also may easily be admitted, that the English artisan, though he has his virtues, has certainly his glaring faults. He proceeds to show that since the last Reform Bill the majority of the electors have been and are artisans, or persons of no better education than artisans. He then lifts up a voice of warning against the danger which awaits society whenever the majority of electors see fit, under the instigation of want and ignorance, to attack the fundamental arrangement of society, and especially the institution of property. Now, the curious point in this line of argument is that almost every sensible person will admit most of the premises, while hardly any sane man really shares the conclusion. The paradox is explained by the fact, which every one feels, that Mr. Greg, writing under a tremendous bias in favor of what may be termed the capitalist point of view, overlooks various considerations which immensely affect the practical force of his inferences. It is not true, in the first place, that to give a mass of men votes is necessarily to give them supreme power. For years the English electorate has been a comparatively poor and by no means very enlightened class. The £10-householders, on whose rule Mr. Greg looks with satisfaction, might easily, on his views, have governed with the narrowest attention to their own immediate interests. They might have oppressed at once the rich and the poor. As a matter of fact, they did not do so, not so much because they were not selfish as because they had not in reality the power which their numerical supremacy appeared to give them. Exactly the same thing is true of the householders who are now with great exaggeration described as the governing body in England. In effect, their theoretical sovereignty is limited at every turn. If universal suffrage were to-morrow established in England, no one really believes that the mass of the people would have despotic power. The electors would be as now a king who reigned but did not govern. Nor does experience show that a popular government involves insecurity of property.

* 'Rocks Ahead; or, The Warnings of Cassandra. By W. R. Greg.' London: Trübner & Co.

† *Spectator* for February 6, 1875.

Mr. Greg alludes constantly to Switzerland, though he gives occasional signs that his knowledge of Swiss history is not precise. He would do well to enquire whether, on the whole, the one genuine European republic has not solved the social and political problems of the day with at least as much success as any state in Europe.

The third rock with which Mr. Greg deals is the gradual divorce observable in every civilized country between the intellect and the religion of the nation. This is a point on which he may well be expected to write impressively. It is one which seems far removed from the questions in answering which a man may be biassed by his political or economical theories. Moreover, the author of the 'Enigmas of Life' has shown singular power of applying to the consideration of theology the rare gifts of honesty and common sense. Nor is the reader's expectation altogether disappointed. In much that Mr. Greg says as to the moral and intellectual evil which is the certain fruit of a condition of society in which religious feeling is at war with intellectual conviction, every man will agree who values either religious belief or intellectual sincerity. Unfortunately, Mr. Greg suddenly turns from the religious and moral evils likely to afflict an age which is at once sceptical and credulous, to speculate on the results which may ensue from the weakening of the "police influence" of Christianity. The result of his speculations, shortly summed up, appears to be that the poor have hitherto been content to acquiesce in the inequalities of life through hopes of the rewards of heaven, but that if anything should lessen the belief in future compensations for a life of misery, there is every reason to fear an attack on those who possess all the good things of this life. To put the matter plainly, an indigent man will, on Mr. Greg's view, begin to sack the jewellers' shops if once convinced "that there is no wealth of gold and jewels awaiting him in the spiritual kingdom."

Of all the delusions into which a man of marked ability ever fell, the belief that Christianity has been, or can be, or ought to be, the great policeman of the universe, is the strangest. In societies where Christianity was unknown, property has been at least as safe as in London or in Paris. The ostentatious alliance of kings and priests has again and again failed either to strengthen the monarch or to support religion. To suppose that the fear of hell or the hope of heaven has been the influence which has directly kept men from picking and stealing is in one sense to overrate, and in another sense to degrade, the real power of religious belief. Few men are really influenced by the thought of remote future and uncertain misery or happiness; and to suppose that the masses of men, who have been in many cases ignorant of the very elements of religion, have been kept in order by religious fears, is to display an ignorance at once of history and of human nature. We fully believe with Mr. Greg that any general disbelief in Christian doctrine might effect grave social results, but it is for the poor and weak and not for the rich and powerful that we should dread the fall of a creed which has fostered if it has not created humanity and charity. The strange thing, however, is that Mr. Greg fails to see that the policeman view of religion is one which spiritual feeling inevitably repudiates. Moreover, his teaching has been long ago anticipated by a far more vigorous writer than even the author of Cassandra's warnings. Swift's "argument to prove that the abolition of Christianity in England may, as things at present stand, be attended with some inconveniences," etc., sums up all the arguments which can be used in favor of the thesis that the poor must be credulous in order that the rich may be safe, and renders such arguments, it might be thought, at once superfluous and useless. Could Mr. Greg state his case better than in the following words: "Whatever some may think of the great advantages to trade by this favorite scheme, I do very much apprehend that in six months after the act has passed for the extirpation of the Gospel, the Bank and East India stock may fall at least one per cent., and since that is fifty times more than ever the wisdom of our age thought fit to venture for the preservation of Christianity, there is no reason why we should be at so great a loss merely for the sake of destroying it"?

## ART REMAINS OF SOUTHERN ITALY.*

THE time of the singing of birds is come, and the yearly exodus to Europe has fairly begun. And this reminds us that we have never noticed two very important archæological books, which no lover of ancient art, whether he proposes to loiter away spring and summer on classic ground, or to stay at home, can afford to leave unread. The one deals with the sculpture of a very important part of the oldest period of art, the other, with the painting of an equally important part of later art. Both are by eminent scholars, and both are specimens of the best German method.

The letterpress and the illustrations of Otto Benndorf's 'Metopes of Selinus' are beautifully got up. Nevertheless, sit is not an expensive book. But we have failed to find it, on enquiry, at some of the great public libraries, and think it only proper therefore to comment on it somewhat in detail. The Introduction gives a history of Selinus, now Castel Veterano, in the southwestern part of Sicily, where a mass of gigantic ruins marks the places where once eight temples stood. We say eight temples. Benndorf mentions only seven. But since his book was printed one more has been added to the list (in March, 1874) by Cavallari, whom many an old Göttingen student in this country will remember from the pleasant days when he was engaged with Baron Sartorius on his great 'Ætna.'

Selinus was founded in the year 628 B.C., and enjoyed an extraordinary prosperity for nearly two centuries, rivalling the proudest cities of Magna Græcia and Greece proper in art, opulence, population, and splendor. Then came the terrible catastrophe of 409 B.C.; the Carthaginian "came down like a wolf on the fold," and took the city after an heroic resistance of nine days. Untold horrors followed: burning, killing, destruction in every hideous shape. Selinus never recovered; and during the First Punic War in 249 B.C., it was taken by the Carthaginians a second time, and the population was deported to Lilybæum. Here endeth the brief story of Selinus: from that day to this it has been nothing but a ruin. It is obvious, however, from the most casual inspection that the destruction never can have proceeded from the hand of man; gigantic masses of column lie flung a hundred feet apart. Nothing short of an earthquake can account for the havoc. The impressive remains would of themselves inspire an interest if no chronicler had recorded the story of the city and no lingering tradition told of its doom: their demonstrable antiquity and the precision of the dates give them in the eyes of the archæologist a tenfold interest and importance.

These eight temples then, by the side of which the ruins of a theatre and of the city walls, gates and all, shrink into insignificance, stood in imposing grandeur on two hills a hundred feet high or so. The hills put out to the sea, enclosing a valley, the higher part of which may very likely have been the market-place, while the southern or lower part touches the waters of the great harbor: dams belonging to this harbor have been found under water at some distance out. A second harbor was constructed at the mouth of the river Selinus, 'Parsley River' (σέλινον, σελινόεις, Σελινοῦς), from which the town takes its name. The city had two large burial-places, which have furnished a great number of interesting vases.

The oldest temple is the one on the Acropolis designated by long-standing usage, even in the guide-books, by the letter "C." It was built at the very founding of the city and dedicated to Apollo, the principal divinity of the town of Megara, from which the settlers of Selinus came. From its irregularities of construction it must be set before the establishment of the Doric canon. It was decorated with the famous archaic metopes in relief, which with the Lion Gate of Mycenæ lead off the grand array of Greek sculpture. Three of the metopes are preserved, and these are characterized by great crudity of style. The faces are all turned towards you, with monotonous and hideous features; but the feet are all seen from the side, just as a child might draw a picture on a slate, to dodge the difficulties of foreshortening. The flesh is puffy and lumpy, the hair a succession of tight curls, the pose stiff and ungainly, helped out in many places with the painter's brush where the rough chisel felt itself inadequate to the task and gave it up in despair. And yet, withal, there is just a trace, just an inkling, of the Greek feeling for art. Such is the impression made by these remarkable reliefs, executed in the very childhood of Greek sculpture, almost two centuries before Phidias set up the colossal Athene on the Acropolis of Athens, or put together his Olympian Zeus with cunning workmanship of ivory and gold.

Plate I. shows Perseus composedly cutting off the oversized head of Medusa. The Gorgon is indeed a monster of most frightful mien, with a long and lolling tongue and an enormous mouth, garnished with the tusks of a swine:

> "All set with yron teeth in raunges twaine,
> Appearing like the mouth of Orcus grisly grim."

A row of corkscrew-ringlets on each shoulder attests her tender sex; while the hair of the other two figures is what is called by ladies "banged," that on the forehead of Medusa looks like rosettes. On the left stands a sister of the unhappy victim, without a ray of interest, simpering in stony apathy. Poor little Pegasus, in Medusa's arm, is touch-

* 'Die Metopen von Selinunt: mit Untersuchungen über die Geschichte, die Topographie und die Tempel von Selinunt: veröffentlicht von Otto Benndorf.' [The Metopes of Selinus. With investigations on the History, Topography, and Temples of Selinus.] Berlin: F. Guttentag, 1873 (dedicated to Frederic Ritschl).
'Untersuchungen über die campanische Wandmalerei: von Wolfgang Helbig.' [Studies of Campanian Mural Painting.] Leipzig: Breitkopf und Härtel, 1873 (dedicated to Ernest Curtius).

ingly helpless ; he has all the wooden look of a Noah's-Ark horse or a student in an Ulster coat. Plate II. represents Hercules carrying the two Cercopes hanging from a yoke across his neck. The thievish gnomes hang down in the queerest, most impossible way. Plate III. is a stiff chariot-and-four, seen *en face*, the horses fairly done ; Phœbus Apollo and the Sun-chariot. Plate IV. gives fragments, including two heads, of which one is exceptionally in profile.

The other metopes (Plates V.–XI.) belong to later epochs. They are not from the region of the Acropolis, but from two temples of the eastern hill, designated "E" and "F." The older temple, F, was embellished with a Battle of Giants, spread over ten metopes, of which, unfortunately, only two are preserved. One appears to be a goddess, Athene or Artemis, giving the *coup de grâce* to a giant sprawling on the ground ; the other a god, probably Dionysus, doing the same to his enemy, who has sunk on his knee. The value of these metopes is immensely enhanced by their rarity. We find here in all the details of representation, in the slender, more natural proportions, in the free-and-easy swing of the limbs, an unmistakable advance. And yet there is a lack of harmony in the whole, a want of that naturalness which tells so powerfully in the marbles of Ægina, now in the Munich *Glyptothek*. Still, the mannerism of the hair and the peculiar expression of the mouth do rather remind one of the Ægina group.

These archaic monuments are chiefly interesting in a historic point of view. The metopes of the third temple, the one called "E," are works of real classic beauty, and worthy of the age of Phidias (Plates VII.–XI.) Plate VII., tasteful and clear in composition, represents Hercules overtaking the Queen of the Amazons and forcing her to halt by treading on her foot : she is making a feeble effort to defend herself with her battle-axe ; but Hercules holds her in the firm grip of his left hand, while his right is just going to deal the fatal blow. Plate VIII. is a fit counterpiece to this splendid metope : the meeting of Zeus and Here on Ida (Iliad, xiv. 153–351). Zeus, in a sitting posture, is drawing Here to him ; Here is standing with affected coyness, toying and fumbling with the ample folds of her raiment. Plate IX.: Actæon and Artemis, according to the Sicilian version of the myth. Actæon had been a suitor of Semele, and thereby drawn down upon himself the jealous wrath of Zeus. In order to stop a union with Semele, Zeus sent Artemis, who was to throw a deerskin over Actæon, and have him torn in pieces by his own hounds. This last scene is the subject of Plate IX. Plate X : Athene fighting with the giant Enceladus, who was believed to lie under Etna, and made himself terrible to the Sicilians by his eternal unrest. Plate XI. gives only fragments.

The reliefs of Temple E are made of various materials, somewhat after the analogy of a chryselephantine statue. Mostly they are of tuff, but the female flesh is represented in Parian marble, the accessories—for instance, the crown of Zeus—are in bronze. Great taste is shown in the tinting ; the background is red, and the sharp contrast between the bright marble and the duller tuff is toned down by layers of color. An inscription shows that this temple was dedicated to Here.

The second book—the last thing on Campanian, or, as it is popularly called, Pompeian mural painting, by Wolfgang Helbig, Secretary of the German Archæological Institute in Rome—is a good guide to Pompeii itself, and good reading for such stay-at-homes as are forced to find their Pompeii in the pages of Zahn, Ternite, etc., in the Astor Library. People who have read a former work of this author ('Wandgemälde der vom Vesuv verschütteten Städte Campaniens'; Leipsic, 1868) need not be told that it is well-written and clear, in many parts deeply interesting, and everywhere brimful of the choicest erudition. Apart from all other merits, it is of signal value for the history of art : Helbig proves, and that most convincingly, that most of the Pompeian mural paintings are only reproductions and adaptations from the Hellenistic period. He shows that the Pompeian fresco, in general, is a substitute for the panel-painting (*tabula picta*) which was the rage in the period of the Ptolemies and the Seleucidæ ; that the peculiarities of manner, foreshortening, etc., are found in Pausias and his contemporaries ; and proves, principally from passages in the poets, that the management of the atmosphere, as found in Pompeian and Roman frescoes, goes back to Hellenistic art. There are two other points of resemblance : common to both is an idyllic coquetry and a tender, languid sensuality.

Perhaps the most interesting and original chapter of the book is the last, on "the fundamental difference between ancient and modern landscape." The principal difference between the ancient and modern landscape is in the aerial perspective. Modern art revels in the dim, the vague, the undefined ; the distant hills and mountains melt insensibly into the air. In ancient landscape there is no such mystery, no such sentiment. The outlines are never dim, but sharp and precise. Not only this, but the ancient languages themselves are singularly defective in expression for atmospheric effects. The most dexterous Hellenist or Latinist, says Helbig, would be quite at a loss to find appropriate Greek or Latin words for many of the commonest terms used in modern descriptions of landscape ; and in the bits of scenery found in Dicaearchus, Apollonius Rhodius, Virgil, and other writers after Alexander the Great, in the description of pictures given by the two Philostrati, no account whatever is taken of the air, its effects on the landscape, or the impression it makes on the mind of the beholder.

If this is true of landscape, it is also true of other departments of painting, and we need not be surprised if in the Campanian genre-pictures there is none of that tender and sympathetic handling of the lights which gives to modern pictures, and particularly to those of the Dutch school, their peculiar charm. The realism of the ancients is therefore confined within very narrow bounds. A modern artist may venture to represent common subjects in all the literalness of nature ; he has the means of throwing a poetic halo round lowness and vulgarity by a judicious and appropriate management of the light. To take an extreme instance of modern realism, pictures of Courbet, like "The Funeral at Ornans," or "The Stone-Breakers," are artistic in spite of the vulgarity of the subjects, and artistic through the temper of the atmosphere ; in the first, the air is grey, cloudy, damp ; in "The Stone-Breakers," we have the noonday glare, hot, dry, and charged with particles of sand. Lacking, then, the modern means for glorifying the ugly or the common, ancient art could not "hold the mirror up to nature" and copy real life directly as it lay before the eye. It was forced to cull carefully from the material presented, to purify, and to make new combinations.

We have forgotten to tell how the author traces out the continuity of art. He has an astonishing familiarity with the countless pictures on vases which have come down from ancient times, and this enables him to illustrate any Pompeian subject that turns up by a number of parallels. In this way he often proves conclusively that a given composition was not invented at Pompeii, but goes back to a Hellenistic original—sometimes an original of great reputation.

## THE UNSEEN UNIVERSE.*

IN *Nature*, nine or ten months ago, there appeared a communication signed "West," registering, for the sake of establishing priority of date, a discovery which, in the anagrammatic form the author chose to give it at that moment, ran thus :

$A^6\ C^3\ D\ E^{12}\ F^4\ G\ H^6\ I^6\ L^3\ M^3\ N^6\ O^6\ P\ R^4\ S^5\ T^{14}\ U^6\ V^2\ W\ X\ Y^2$.

These letters placed rightly compose a proposition—"Thought conceived to affect the matter of another universe simultaneously with this may explain a future state"—of which this book is the full elucidation and expansion. It seems probable, therefore, that "West" was one of the two reputed authors of the 'Unseen Universe,' and presumably the senior partner. Of him it may be said that he is at all events no sciolist in physics, and the way in which Biblical texts and the most ruthless of modern scientific hypotheses combine to shape and support his conclusions is, in the year of grace 1875, a phenomenon which really gives one an impression of freshness and originality.

His argument runs somewhat as follows : Modern physics postulates, in addition to the gross matter which we can weigh and feel, another form of material existence called the ether, or medium. Some very transcendental speculations have endeavored to explain how such a characteristic property of the gross matter as gravitation might be derived from the pressure of the ether. Furthermore, the qualitative difference which the gross matter presents to our senses and reagents are explicable by various hypotheses as to its quantitative internal molecular arrangement. The "elements" of chemistry may owe their distinction from each other to the different groupings of the homogeneous primordial atoms of which they are built. Now, primordial atoms themselves are supposed by Sir Wm. Thomson to be vortex rings generated out of a perfect fluid filling all space—in other words, eddies in the medium, or portions of it mechanically differentiated. This conception does not, it is true, account for gravitation ; hence its originator adopts the additional hypothesis of ultramundane corpuscles, which he supposes to be a finer form of vortices. Our present author, who is a determined adherent of development, objects to the hypothesis of the medium being a perfect (frictionless) fluid, because in that case we cannot suppose matter to have been evolved from it, but must needs resort to the hypothesis of creation, which is an appeal

* 'The Unseen Universe ; or, Physical Speculations on a Future State.' New York : Macmillan & Co. 1875.

to the unconditioned always to be avoided ; and moreover, because certain facts connected with the light of the stars suggest the conclusion that the ether is not perfectly transparent, but *absorbs energy*. But with whatever differences of detail, the upshot of all these speculations is that matter and the medium, or the visible and the invisible, are considered materially and dynamically continuous. One arose in time by a coagulation or precipitation occurring in the other, and must needs end in time, if the other be not a perfect (frictionless) fluid, by the undoing of the momentum of rotation it contains. The great law of dissipation of energy, too, which requires us to imagine a constant leakage into the ether of heat vibrations from the visible world—vibrations which will never be restored—leads to the same conclusion. The energy which is leaving our visible world in every direction at the rate of 188,000 miles a second *is not lost*. "It will all be ultimately appropriated by the invisible world, and we may now imagine as a possibility that the separate existence of the visible universe will share the same fate, so that we shall have no huge useless inert mass existing in after ages to remind the passer-by of a form of energy and a species of matter that is long since out of date and functionally effete. Why should not the universe bury its dead out of sight ?"

This bold conclusion is the culmination of the author's scientific argument. The use he makes of the ethereal world thus left upon his hands, with all its stored-up energy, is, if possible, more purely speculative still. In the first place, it has a *history* connected with that of the visible world, since by transfer of energy from the latter it is conditioned in time, direction, amount, etc., by the particulars which are now and here occurring. Every event here, then, is recorded by its traces on the invisible world, and these traces may be organized (it is not attempted to define how) into a memory. A possibility is thus afforded for a continuity of being, both conscious and material, between the two worlds, and our faith or fancy may fill out its details in the way that seems most fitting. The author's aim simply is to explode the notion that science *debars* the supposition of such a continuity. He indulges in some further speculations about superhuman intelligences in that world, and concludes that it must contain an *immanent* intelligent agency which once determined the manner of formation of the visible universe from it, and impressed upon the molecules thereof that uniformity which Clerk-Maxwell calls the stamp of the "manufactured" article. This immanent agency is proved by Scripture to be the Second Person of the Trinity as distinguished from the First, who is transcendent.

The points which strike us most in the whole attempt are, first, the urgency of the author's demand for "continuity," or the principle of explaining one conditioned event by another conditioned event, and "pushing back the Great First Cause as far in time as possible," combined with his hopelessness of "driving the Creator out of the field altogether," and resulting in the compromise by which he gives us the Son as indwelling in the world, and merely determinative, not creative, of its molecular events, whilst the Father stays outside in inscrutable majesty, with apparently no function but to keep up logical appearances. Secondly, we are struck by the way in which he immediately resorts to teleology to determine the particular constitution of that unseen world of whose existence his previous arguments have established the probability. In a word, his tactics are in logical form precisely identical with those of the most primitive, "unscientific," and short-winded natural theologian, the only difference being in the scale of his operations. He shows us the same mechanical determinism in the line of events we clearly and familiarly apprehend, and he bounds the penumbra *a parte ante* in the same way by the Absolute Cause, and defines it *a parte post* by faith, guided by teleological reasoning. It is only the incomparable superiority of the modern scientific imagination on its *quantitative* side that may seem at first to give our author's speculations a different aspect. And truly enough, if vastness of scale be a real character of the universe, both in space and time, those Hindu-like imaginations which are pleased with the contemplation of monstrous lengths, and are able to feel the difference between sums expressed in units of different orders of infinity, would seem the best fitted to divine its secrets. The German and English imaginations are fast being educated up to this spaciousness, whilst the French mind lags behind both in this point and in its feeling for continuity. Our author, therefore, may enjoy the credit of having attacked the problem of natural theology (and solved it in his way) on a scale not unworthy of the grandeur of the theme's dimensions.

But when he professes to have *mediated* between Science and Religion we cannot grant his claim. He simply gratifies the demands of science for an ever-wider scope, and thus throws upon religion a vaster task for her translating and interpreting powers. But his scientific unseen world is by no means identical with the world "behind the veil" of religion. Christian devoutness has never expressed its trust simply in "another," but always in "another *and a better* world." Our author's belief in the "betterness" of that "other" world which he constructs for us demands from him at the end of his mechanical gyrations, be they never so ingenious and rarefied, the same simple act of teleologic trust, the same faith that the end will crown the work, with which the most narrow-minded old woman so quickly envelops her briefly-recited cosmogony. We for our part not only hold that such an act of trust is licit, but we think, furthermore, that any one *to whom it makes a practical difference* (whether of motive to action or of mental peace) is in duty bound to make it. If "scientific" scruples withhold him from making it, this proves his intellect to have been simply sicklied o'er and paralyzed by scientific pursuits. In the physical realm the "subjective method" of finding truth may be the root of all evil. But the affirmation that this physical world has *also* a moral meaning and a moral plan is one that no argument drawn from purely physical truth can either establish or impugn. It is nevertheless an affirmation which either is or is not true, and which if true may, from the very nature of the case, be intended to command from us only that inward, free, or moral assent, or rather consent, in which the subjective method consists. As we have said, the 'Unseen Universe' does not make this consent essentially easier. It establishes no "continuity" whatever between mechanical reasoning about facts at our feet and teleological reasoning about ultimate things. But it widens the data and horizon which teleology receives from science, in accordance with the sentiment of the day ; it will, doubtless, be found suggestive both by men of science and divines ; and it deserves to be widely read.

---

*Brief Biographies of European Public Men.* Edited by Thomas Wentworth Higginson. Vol. I. English Statesmen. Prepared by Thomas Wentworth Higginson. (New York : G. P. Putnam's Sons. 1875. 12mo, pp. 363.)—It is not often that a new publication is so precisely fitted to fill an empty space as this little book of Col. Higginson's. Everybody was wondering, for instance, the other day, who, or rather what, the Marquis of Hartington was, that he should be selected as successor to Mr. Gladstone ; and certainly, of the eighteen names here given, very few are more than a name—many not even that—to the majority of American newspaper readers. Here we find just the information that was needed, and in a very compact and at the same time readable form. The book is divided into three parts : the first containing eminent statesmen—Messrs. Gladstone, Disraeli, and Bright, Earls Russell and Granville, and the Duke of Argyll ; the second, Mr. Disraeli's Ministry ; the third, candidates for the Liberal leadership. It professes to be nothing more than an attempt to condense several books into one, which task has certainly been accomplished with great skill Nearly every paragraph is marked with inverted commas ; but the books thus condensed are at once so graphic and so discerning, and the selections are made with such good judgment, that the whole leaves little to be desired. We notice frequent extracts from the correspondence of the *Nation*. If there is any deficiency, it is in quotations from the statesmen's own words ; there is a long speech by Mr. Forster, and some excellent passages from speeches of Messrs. Gladstone, Disraeli, Bright, etc. ; but the American public would, we think, particularly relish more abundant illustrations of English eloquence. The next volume is to contain "English Radical Leaders," by Col. R. J. Hinton ; a third, "French Statesmen," by Edward King. In neither of these will there be lack of equally good material. Other volumes, which will follow if demanded, may be somewhat more difficult to prepare, but will, we are sure, be equally acceptable and useful.

---

*Alexander the Great in the Punjaub.* From Arrian, Book V. With Notes. By the Rev. C. E. Moberly, M.A., Assistant-Master in Rugby School. (London, Oxford, and Cambridge : Rivingtons. 1875. 16mo, pp. 68.)—Alexander's campaign in India has, to an American boy, only the general interest which attaches to an episode in the name and career of a great warrior, but in an English school it must appeal to the personal sympathies and associations of the pupils in a degree which would be the case with very few of the ancient classics. It is therefore admirably adapted to the use of an English school ; and Mr. Moberly in his edition has taken pains to enhance this immediate interest by continual allusions to and comparisons with the modern campaigns. The work is scholarly, and is suited to American schools or college classes as well as English.

## *Family Record Album*

IN BLANKS CLASSIFIED ON A NEW SYSTEM.

Large quarto, 320 pages, cloth, $5; half-morocco, $8; full Turkey morocco, with clasp, $15; full Levant morocco, with metal rims and lock, $25. (Sold only by Subscription.)

This book has been made because the editor felt the need of it, and supposed that many others felt the same need. The pages are of seven kinds, viz.: Family Pages for the names of the immediate family; Genealogical Pages for the ancestry; Tabular Pages to record with a word or figure, and to ascertain them at a glance, such particulars as parentage, time, and place of birth; weight and height at various times of life; dates of vaccinations, naming, dentition, walking, talking, learning to read, write, swim, etc., going to and leaving schools and college, entrance upon trade or profession, marriage, residences, diseases, accidents, etc., etc.; Biographical Pages, for fuller personal details not otherwise provided for; Heirloom Pages, to keep records of interesting things about the house; Domestic Economy Pages, to record the manner of living, house-rent, expenditure, income, etc.; Miscellaneous Pages, for matters not falling under any of the previous divisions

Sold only by subscription. Orders received by the publishers.

☞ Agents wanted. Persons of character and ability can increase their incomes and do useful work by devoting all or part of their time to disseminating this work. Correspondence invited.

LEE, SHEPARD & DILLINGHAM, New York.

*THE SCHOOL BULLETIN AND* *New York State Educational Journal* for June will contain five hundred examination questions, a full report of the Social Science Association, and the *London Quarterly* article upon "Education in America." The *Bulletin* is now the largest educational journal published. Subscription, $1. Specimen copies, 10 cents. Address *School Bulletin*, Albany, N. Y.

*G. P. PUTNAM'S SONS,*
Fourth Avenue and Twenty-third Street,
NEW YORK,
Have just published:

## *The Keys of the Creeds.*

12mo, cloth extra, $1 25.

"A religious work that will undoubtedly make a sensation."—*Springfield Republican.*

"A remarkable work, that will attract the same class of readers as 'Ecce Homo.'"—*Newark Courier.*

"Promises to attract much attention. . . . The authorship is kept secret, and may become the subject of as many conjectures as that of "Ecce Homo.'"—*N. Y. Tribune.*

"May be said to be the Darwinian theory of development applied to religion. . . . Ably written, reverential, full of novelty, and certain to be widely read."—*Memphis Appeal.*

*PRINTERS' Cabinet, Type, Press, and Boxwood* Depot; Eagle Cabinets; Pattern Letters for Machinists. —VANDERBURGH, WELLS & CO., cor. Fulton and Dutch Sts., New York. N. B.—Engraving—Electrotyping.

## *Starr & Marcus,*

*Jewellers and Silversmiths.*

DIAMONDS AND GEMS.

*Works of Art in Stone Cameos.*

BRONZES, CLOCKS, AND ORNAMENTS.

*22 John Street, New York.*

*F. W. CHRISTERN,*
FOREIGN BOOKSELLER AND IMPORTER,
77 UNIVERSITY PLACE, NEW YORK.

Large assortments of the publications of Charpentier, Didier, Didot, Hachette, Lévy Frères, etc., on hand; also complete lists of Tauchnitz's Collection of British Authors, and Teuner's Greek and Roman Classics. All European periodicals received weekly in parcels.

Complete in Five Parts.

## *Smith's Historical Atlas.*

An Historical Atlas of Ancient Geography, Biblical and Classical. Compiled under the superintendence of Dr. William Smith and Mr. George Grove.

This magnificent and valuable work is now completed in Five Parts. It contains forty-two large and beautiful Maps and complete Indexes.

"The whole work is a splendid specimen of what can be achieved by learned labor and technical skill."—*London Athenæum.*

Price $7 per Part.

LITTLE, BROWN & CO., PUBLISHERS,
BOSTON.

## *SPECIAL NOTICES.*

TERMS: In advance, four weeks, 10 cents per word; one year, $6 24 per line. Letters forwarded.

### *Wants, etc.*

*A GRADUATE of Columbia College desires a* position as resident or visiting tutor during the summer or coming year. Best references given. Address KAPPA, *Nation* office.

*A HARVARD GRADUATE desires an engagement* as travelling or visiting tutor. Address Z, office of *Nation.*

*A LADY, graduated, experienced in teaching,* desires an engagement for fall in family or school. Teaches French and German. Satisfactory references. Address Box N, *Nation* office.

*A LITERARY GENTLEMAN, late Assistant* Editor of a London Journal, is desirous of a similar appointment in the city or immediate neighborhood. Address ENGLISHMAN, *Nation* Office.

## *Art-work in Silver*

*The Gorham Company,*

No. 1 BOND ST., NEW YORK.

The most extensive and brilliant collection of rich

*BRIDAL GIFTS,*
*TESTIMONIAL PIECES,*
*FAMILY SILVER,*

etc., etc., to be found in the city, now offered at retail at the lowest possible prices.

The Gorham Stamp is an evidence of sterling purity and excellence alike to the purchaser and receiver.

## *Buckingham Hotel,*

*Fifth Avenue, cor. Fiftieth St. (opposite the Cathedral).*

Great care has been bestowed on the Steam-Heating, Plumbing, and Ventilation of this elegant House, which will be completed September next.

*"THE READER" discusses on page* iv *a new work on Botany, of the highest importance, just issued by Macmillan & Co.*

*JAMES TOLMAN & CO.,*
FINE CUSTOM TAILORING,
No. 249 WASHINGTON STREET, BOSTON,

Respectfully invite attention to their stock of goods for gentlemen's garments. All orders carefully and promptly executed. Location very central, being midway between School and Court Streets.

*AN AMERICAN BOY, of a good family,* wishes to help out of doors at some gentleman's country residence during the summer. Address C. C., *Nation* office.

*AN EPISCOPAL DIVINITY STUDENT* wishes a position as travelling companion to one or two boys. Travelling expenses only desired. Refers to patrons of last summer. DELTA, *Nation* office.

*A YALE GRADUATE desires pupils to fit* during the summer for fall examination. Refers to the College Faculty. Address M., office of the *Nation.*

*MME. M. DE MALTCHYCE, of Boston,* wishes to take charge of several young ladies, for an educational turn in Europe, during a whole year. For particulars, please apply at her residence, 102 Mt. Vernon Street.

*TWO HARVARD JUNIORS wish pupils* for the summer. Satisfactory references given. Address J., *Nation* office.

*WANTED—A situation as Teacher of the* English branches by a graduate and person of experience. Address J. W. R., Box 1,042, Poughkeepsie, N. Y.

*WANTED—Resident Lady Physician for* Lasell Seminary, Auburndale, Mass. Apply at once.

*AMER. SCHOOL INST., founded* 1855, is a reliable and practical Educational Bureau—
To aid Families and Schools of every grade in need of well-qualified Teachers;
To represent Teachers who seek positions;
To give parents information of good Schools;
To sell, rent, and exchange School Properties.
Twenty years have proved it efficient in securing "the right Teacher for the right place."
J. W. SCHERMERHORN, A.M., Actuary,
14 Bond Street, New York.

*LUCRATIVE SCHOOLS for Teachers of all* Grades. Apply for circulars. "Western School Agency," Chicago, Ill.

# The Nation.

*NEW YORK, THURSDAY, JUNE 3, 1875.*

## The Week.

THE Pennsylvania Republicans appear to have made up their minds thoroughly that a "third-term plank" is now needed in the platform of any party which means to be successful at the polls. The platform adopted at the Convention at Lancaster on Wednesday last accordingly contained one; it may be said that it was the only interesting thing in it. The correspondent of the New York *Times*, who is strongly Republican, reports that the audience cheered vociferously on hearing it, but listened to all the others, including the eulogy on the Administration, in dead silence. For the rest, the resolutions are framed on the plan—which we trust will become popular—of the New York Democratic resolutions of last year; that is, each describes in brief terms an object of desire, and nothing more. But then, one hardly knows after reading them any better than before what desires the Pennsylvania Republicans have which all decent men of every party do not share, except that for protection and paper-money. They seek equality before the law, harmony of National and State Governments, purity and efficiency of administration, reconciliation between labor and capital, cheap transportation for man, beast, and goods. They also demand "free banking and a safe and uniform currency adjusted to the growing wants of the business interests of the country," which is an exact description of coin, but is generally taken to mean unlimited paper, or Kelley's 3-65 scheme. After the usual vigorous round of abuse of the Democratic party, the present Governor was renominated.

---

The President has at last quieted the apprehensions of people who thought he was going to run for a third term, by an explicit letter of denial. He says he took the office the first time unwillingly, is not now, and has not been, a candidate for re-election, but thinks the people ought to have the right to elect a man for a third time if they please, and declares that the reason why he did not sooner announce his withdrawal from the arena was because he thought it "beneath the dignity" of his office to answer any question on the subject until it had been presented "by a body of such dignity as not to make a reply a fair subject of ridicule." The fact is that he has delayed his denial, in spite of the urgent solicitations of prominent men in the party in all parts of the country, until the formal repudiation of him by the Pennsylvania Convention showed that he was likely to be visited with a similar slight by every Republican convention which would meet during the coming year. He has at last spoken, but only when threatened with an unprecedented indignity by his own party. The allusion to the "dignity of his office" he might very well have omitted. Of this no President has shown himself so careless. His sensitiveness about the newspapers, and the extraordinary measures—such as keeping disreputable men in office after exposure—to which he has resorted in order to produce an appearance of indifference to their clamors, to make no mention of the character and social standing of many of his intimate friends, make his talk about "dignity" either meaningless or repulsive.

---

He does not even now say positively that he will under no circumstances consent to another nomination, but he does say that he is not a candidate, and "would not accept a nomination if it were tendered," unless circumstances should make it an "imperative duty"—a "circumstance," as he says, "not likely to arrise." This declaration, although it does not absolutely prevent his taking office again, for practical purposes amounts to a declaration that he is out of the field and does not mean to try to get into the field, and the Republicans are now so thoroughly convinced of the danger to the party which the incubus of the Administration has created that they may be relied upon to give him all the assistance in their power to keep him out of the way of doing them any more harm. The President says, among other things, that he is "surprised" that so many "sensible persons in the 'Republican party'" should permit their "enemy" to force this issue upon them, and declares it to be his conviction that the idea that any man could ever renominate himself as President "is preposterous," and that it is a reflection upon the intelligence and patriotism of the people to suppose such a thing possible. In reading this delicate compliment, it is difficult to believe that it comes from the same man who four years ago was so deeply impressed with the danger to the country from the office-holders, wire-pullers, and politicians generally that he proposed to take all temptations away from them by means of civil-service reform.

---

Decoration Day in the State of New York, though not, we believe, universally throughout the country, is a legal holiday, and on Monday last it was observed, certainly in New York, more generally than has been the custom in previous years. The sentiment of the day is so natural and touching that we should be sorry to see any sign of its observance dying out; but the press has begun to discuss the possibility of keeping it up as the years go on and the memories of the war fade, and this is in itself an indication of uncertainty. We have not been very successful with the holiday which the war of the Revolution bequeathed to us—the exclusively political character given to it in the early days having become rather monotonous as time has gone on and furnished other subjects for reflection than the heroism of the fathers and the tyranny of British rule. Decoration Day has, however, the great advantage in its favor of being a natural holiday, and originally the result of a spontaneous expression of genuine, not merely statutory feeling. It may be said against its continuance that it will be impossible to keep alive the interest in the graves of the men who fell in the rebellion after this generation has passed away, and that it will then become an empty ceremony; but even in that case the holiday will still remain, and holidays with our overworked people are so few that any reasonable addition to their number is a cause for congratulation. The idea that putting flowers on the graves keeps alive the "animosities of the war" is a pure piece of nonsense. In the way of a commemorative observance, there is probably nothing which would so tend to soften them.

---

Before our last issue had come from the press the misfortunes of the Erie Railway had culminated, and the company had been placed in charge of a receiver—Mr. Jewett, the president. The application for a receiver was made by the Attorney-General of the State, and was supported by a complaint making the most damaging charges in regard to the present condition of the company, as well as its management, since the "rescue" of the property from Gould. Among other things, the complaint charges that the dividends which have been declared under the "reform board" were not earned, that the latest issue of bonds (nearly $15,000,000), for which the company received only about 40 cents on the dollar, was fraudulent, that the negotiations and contract with the Atlantic and Great Western were scandalous, and that, in effect, the company has only been kept from declared insolvency for years by questionable "financing." The directors of the company made no opposition to the appointment of a receiver; three of them became bondsmen for Mr. Jewett, to whom the court gave almost absolute power. It is probable, if the Delaware and Hudson and Delaware, Lackawanna and Western Companies (which now practically control the coal market and which were anxious to extend their control to the coal-lands of the Erie) had been satisfied with the security which

the Erie offered for a loan of $500,000, that the failure would have been "bridged over." The turn in Erie affairs promoted speculation not only in its shares but in those of other companies. At the Stock Exchange it has been the most active week of the year, and prices have declined more than in any other six days. Much of this depression was due to purely speculative influence, but the developments in Erie have raised suspicions as to the manner in which other companies, no less respectably officered, are managed. The effect of the railroad war on Erie receipts since January has also raised the question whether the other trunk-lines are not suffering to the extent of impairing their dividends to shareholders. It is not likely, however, that the railroad war will be kept up longer than midsummer, although Mr. Garrett, of the Baltimore and Ohio, has within the week defiantly proclaimed at Chicago that he has no idea of abandoning his present position. It is conceded that he is better equipped for the fight than is either the New York Central or the Pennsylvania, but with the Baltimore and Ohio stock declining (it has fallen about twenty "points" in the past four weeks), and with Baltimore deriving no marked advantage in its trade, it is doubtful if his utterances are more than might be expected of a man of his temperament at this stage of the contest.

---

While what is called general trade has not been so good as was expected, the foreign-trade figures of the port show activity. The foreign imports for the week were $9,357,000, against $8,580,000 last year, and $6,515,000 the year before. The exports of domestic products were $6,050,816, against $5,376,000 last year, and $5,205,000 the year before. The latter have undoubtedly been stimulated by the breaking-up of the speculative clique at Chicago which undertook to control the price of grain not only for this continent but for the European markets as well. The load became too large for the idle resources of the Chicago banks, and liquidation has been forced, with the result of a heavy decline in the price of grain and a general improvement of Chicago credit. It is now tolerably clear that the "grasshopper plague" was exaggerated in the interest of Chicago speculators, staggering under the attempt to carry the grain markets of the country on their shoulders. The prospects of the cotton crop continue good, the best estimates giving a larger acreage and better condition than last year. The Erie speculation here and in London diminished the specie export for the week, which was only $1,598,112, but most of that in the latter part, when the indications were that, Erie bills having been all taken up, the outflow would again be large. Thus far this year we have exported $31,461,000 specie, about $8,000,000 more than last year, and $11,000,000 more than in 1873. The New York banks continue to gain legal-tender notes, and have now $63,371,000. Money is unwholesomely cheap. It is gratifying to know that Mr. Bristow has been able further to reduce the legal-tender circulation by $1,000,000, making a reduction of $5,000,000 since he became Secretary.

---

Two very singular incidents have taken place in Boston. A prominent trust lawyer, after a long career of usefulness, committed heavy defalcations, and disappeared. After two or three weeks he was found in a village in the Adirondacks, making arrangements for a summer's fishing, and on his way to Canada to examine some "blooded stock," after the manner of the Honorable William S. King of Minnesota. On being arrested, too, he expressed great surprise, and, like so many other accused persons of late years, declared that the stories of his troubles were a "newspaper scandal," or, in other words, that he was the victim of a "licentious press." He doubtless asks himself sorrowfully what is going to become of the country if no means can be found to check the growing meddlesomeness of the newspapers. The other affair was the murder of a little girl in a church tower, five minutes after she had left her companion's side, by the sexton. It now appears that the sexton was and is well known to the police as a man of doubtful character, who has been already suspected of complicity in a murder. It would seem from this as if the religious organizations in Boston were beginning to take lessons from "the best civil service on this planet," and were appointing persons to places of trust without any reference to character and antecedents. A sexton, it is true, does not need to be a saint, but he needs to be a man of fair reputation and of peaceable disposition.

---

Senator Anthony recently paid a visit to the South, and in giving an account of the state of things there which he did not find satisfactory, he mentioned, among the bad phenomena, the refusal of Southerners and their wives to associate with officers of the United States army and their wives. Whereupon the New York *Tribune* remarked that, unfortunate as this might be, it did not see what Senator Anthony could do about it, and insinuated that he might like to compel association by law. Mr. Anthony replies to this in his paper, the Providence *Journal*, with an amount of good sense which has of late not been common among Republican politicians, by acknowledging that there is no help for this condition of things, that there is nothing in it to legislate about, and that all talk about it is "tea-table nonsense"; that it is not an evil, but the "expression of an evil"; not a disease, but "the symptom of a disease." We wish sincerely some of his colleagues could have taken this view sooner. Two-thirds of their talk about the condition of the South has been "tea-table nonsense." Most of the Civil-Rights Bill is "tea-table nonsense." The Force Bill is mainly arrant nonsense, inasmuch as it undertakes to remedy things which do not admit of legislative remedy. The theory that people ought to be prosecuted for refusing to love you is, however, an old one. "Sois mon frère ou je te tue" was an old cry of the Jacobins, and it has to be the cry of any party which tries to carry out Sentimentalist theories by the use of brute force.

---

The loss of the *Schiller* continues to undergo a good deal of discussion in the English papers, and, as might have been expected, a good deal of attention is directed to the failure of the captain to sound as he approached the coast. Several nautical men of high standing have written letters asserting positively that if he had sounded, the character of the bottom would have given him his position within sufficient limits. One captain in the navy gainsays this by averring that reference to the chart will show that the character of soundings, even in the channel in which the *Schiller* was lost, is often the same at points twenty-five miles apart; but this simply amounts to saying that sounding in foggy weather is not as satisfactory as an observation in bright weather. That it does not give a navigator his exact position is no reason for not resorting to it at all after several days of reliance on dead-reckoning, as appears to have been the case of the *Schiller*, or as was more notably the case with the *Atlantic*, where the captain ran eight days in fog, never sounded, and went plump on shore on a calm night. The answer of the officers at the subsequent official investigation to the question why they had not sounded was "that they thought it was of no use"—or, in other words, were so stupidly sure of their position that they would not take even a small amount of trouble to ascertain it. It has been suggested in England, and very sensibly as it seems to us, that the taking of soundings under given circumstances should be made imperative by law, as well as the record of the result in the log-book, that its omission should be made a penal offence as regards the officers in case of an accident or the loss of the ship, and should, as far as the owners are concerned, be made to vitiate the insurance, and thus enforce greater care in the choice of officers. It is evident that it is in this direction, rather than in that of life-saving apparatus, that we must look for greater security at sea. In spite of all the improvements in life-boats of late years, and in life-preservers and lowering tackle, lives are hardly ever saved in a serious accident by any of them, because they all need an amount of organization, discipline, presence of mind, and powers of endurance which, in moments of supreme peril, are not to be looked for among a motley crowd.

Mr. Jenkins, the author of 'Ginx's Baby,' seems, as might have been expected, to have been completely thrown off his balance by the success of that thoughtful work and his own subsequent election to the British Parliament. He has just headed an amusing deputation of authors and writers, some known and some totally unknown, to Mr. Disraeli to demand the appointment of a Royal Commission or of a Parliamentary Committee to examine the rights and wrongs of authors, and "the incidents of literary property," whatever that may mean. The deputation complained of all sorts of things in connection with the existing law of copyright, and amongst others of the unauthorized copying by other periodicals of articles from the daily papers. Mr. Moy Thomas, of whom few persons have ever heard until now, was the principal spokesman of the deputation, while Mr. Tom Taylor revealed the wrongs of dramatists; Mr. Sala, those of journalists; and Mr. Charles Reade, those of novelists. Mr. Disraeli "put the question smiling by" by promising entire attention to their statements and grave consideration of what had best be done. Mr. Jenkins, however, as the only member of Parliament in the deputation, was not disposed to let the matter rest in this way, and asked Mr. Disraeli the same evening in the House of Commons whether he was going to issue the Commission or not, and this gentleman replied, amidst the amusement of the House, that he had not had time for deliberation during the day, and must ask for longer delay, which it is to be hoped Mr. Jenkins will give him. It is not everybody who can solve knotty social problems with as much rapidity as this "thinker."

---

The more recent advices from Europe confirm the belief that the late visit of the Emperor of Russia to Berlin, in so far as it had any political significance, was favorable to the preservation of peace, and that if there exists anything in the shape of an alliance or understanding between Germany, Russia, and Austria to-day with regard to the general politics of the Continent, as there probably does, it guarantees the existing situation; that is, while it would oppose any attempt on the part of France to recover her lost provinces, it would also oppose any attempt on the part of Germany to treat the efforts of France to restore her military strength as a *casus belli*, or to crush her utterly as a precaution against future attacks. It is not denied that some such scheme as this has found a lodgment in the brains of some of the Prussian military men, who, as a class, are perhaps now less sensible to purely political considerations, and to the feelings and necessities of civil life, than any similar body of men in the Western world; but there is no pretence that these views were shared or countenanced by any German politician properly so called. Nor is there the least sign that such an atrocious plan would have been tolerated by the rest of Europe. In such a fight as it would entail, France would certainly have the sympathy of the civilized world, and probably the material aid of more than one power.

---

In France, the "scare" has after all produced no great effects, the Government being all along aware that its relations with Germany were perfectly friendly, in form at least, and the people, in so far as they pay any attention to politics, having their thoughts turned to the approaching dissolution of the Assembly. This, it is now conceded on all sides, is close at hand. The Legitimists, who have most to fear from the dissolution, do not pretend that it can be deferred in any event beyond the spring of 1876, while everybody else looks for it by October next. Its importance to the private members may be guessed from the fact, that while this Assembly consists of 750 members, the next will only contain 500, and of course a large proportion of those now sitting have no hope of being returned under any circumstances. A good many of them are therefore naturally going to try for a seat in the Senate, which the present Assembly will probably now elect, as their last chance for public life. One of the curious incidents of French politics is to be found in the denunciation by the Ultramontane papers of a bill providing for the extension of the powers of savings-banks, on the ground that these institutions tend to destroy people's trust in Providence.

---

In the meantime, Bismarck pushes on the war against the Ultramontanes without flinching. The Pope's last letter to the German Bishops, declaring the Falk Laws null and void, has been answered by two bills, which may be said to cap the climax of this rigorous legislation. One gives the Old Catholics the use of the parish church and a share of the church property, proportioned to their numbers, whenever they may choose to form a separate religious organization. The other extinguishes the religious orders, male and female, at one blow, allowing those devoted to charitable work a respite, which must depend on good behavior, but summarily suppressing the purely spiritual and educational ones. The convents are to be shut up to keep the religious from keeping schools; and in order to prevent their carrying on the work in private families, and thus evading the law, the Government is to determine in what part of the country they are to reside, if they do not wish to leave it altogether, as they probably will. Dr. Falk made a speech in support of this bill during the debate, in which he quoted a speech of a leading Ultramontane, Herr von Buss, made at a Catholic religious gathering at Baden in 1851, just after Prussia had succumbed to Austria, in which the Ultramontane plans were foreshadowed, and in which the speaker regretted the pacific settlement of the Austro-Prussian troubles. If Radetski, he said, had forced his way to Berlin, the authority of the Pope would have been restored in Prussia, and all the Protestants of that nation brought back to the bosom of the Church. He then declared that, though this had failed, the Catholic programme must be faithfully carried out. Austria, as a Catholic power, must be strengthened and supported, and the work of propagandism in Prussia through Catholic agents vigorously carried on, so as to wrest from her finally her Catholic provinces, and to build up again the Holy Roman Empire. Dr. Falk maintains that this plan has been faithfully carried out, or would have been if the events of 1866 and 1870 had not arrested it. In 1851, there were only 1,200 monks and nuns in Prussia; there are now more than 9,000, and they have secured a large share in the work of education.

---

The Committee of Thirty of the French Assembly, the Conservative members having resigned in a huff, has been reconstructed, with a two-thirds representation of the Left—a result due, it is said, to divisions in the Conservative ranks. Of the ten Conservative members of it, six owe their places to votes of the Left, and that party in putting them in made a display of magnanimity which, under the circumstances, is something new in French politics, and, small as it is, shows considerable gain in both skill and moderation on the part of the Radicals; but the places have, it is said, been refused. However, the composition of the Committee has lost most of its importance, if not all, since the passage of the Constitutional laws. As to these, the Government has given in its adhesion to them in the fullest manner. The Minister of Justice has given notice by circular to all the judges and law officers that a permanent government has been established and that they must see that it is respected. The Minister of War has made the same announcement to the army in general orders. The Minister of Public Instruction, M. Wallon, has declared in a speech that the Assembly has simply, by its recent legislation, recognized a republic which it found already established, by force of circumstances, on the ruins of the empire. From all sides, in short, except the Bonapartists and the extreme Legitimists, there come expressions of adhesion to the new order of things, and of thankfulness that France had at last obtained a government by means of peaceful discussion. There has occurred in Paris, too, and within two months, a scene such as few Frenchmen have ever witnessed before—a peaceful and chatty interview in a drawing-room between M. Thiers, the late "chef de l'état," and Marshal MacMahon, his successor. For eighty years, the predecessor of the French chief-magistrate for the time being has usually been a refugee in a foreign country. In short, the situation looks more hopeful than ever.

## THE SOUTH AND THE CENTENNIAL.

THERE appears to be every likelihood, owing to the legislative failures of the Administration at the last session of Congress, that the Centennial year will really witness a substantial restoration of good feeling between the North and South. The first step towards this most desirable consummation was taken when Congress refused to carry out the policy of hatred and dissension which a portion of the managers of the Republican party seemed to have decided to be necessary in order to keep it in power. The speeches which they delivered during the last canvass in support of this policy would have been discreditable to their intelligence even if they had been based on carefully-collected facts; based as they were on fictions prepared in the main by the disreputable adventurers who have so largely represented the party at the South, they indicated something worse than want of intelligence. Mr. Dawes, for instance, when he was stumping for Butler last fall, can hardly have believed, as he said he did, that every negro at the South went to bed at night in expectation of having his throat cut before morning. If he had thought so, he could not have gone calmly about his business ever since, leaving so many of his fellow-citizens in this deadly peril. Nor could Mr. Boutwell have rested on his pillow at night had he really believed that we were last winter on the eve of another civil war. Even if the condition of the South had been what they represented, the remedies which some of the party chiefs proposed would have been none the less barbarous and futile. Violence is not cured by violence, nor lawlessness by illegality. The evils from which the South suffers are social diseases, which must be got rid of not by this or that quack remedy, but by the growth of civilization. But the condition of the South not being what they said it was, the country is to be still more warmly congratulated on the failure of Republican plans for its government. The defeat in Connecticut, following on the wild and inflammatory speeches of the prominent orators sent into the State, the failure of the crusade against Louisiana and of the Presidential conspiracy against Arkansas, found the South in just the state of mind to receive the frustrations of such schemes as peace-offerings. They were taken, and rightly taken, as indications that the North was weary of strife, of distrust, of suspicion, of proscription, and was willing to recur again to the old-fashioned American treatment of political diseases, and was fast reaching Burke's conclusion—so aptly quoted by Governor Chamberlain at Lexington—that "a great empire and little minds go ill together," which is simply an epigrammatic way of saying that political maladies are not to be got rid of, as small politicians sometimes suppose, in two days, by taking a blue pill; that time and patience and hopefulness and a generous faith in human nature are the remedies with which the madness or corruption of communities has to be fought; and that a generation or two of politicians has often to pass away before the recovery need be looked for.

That the recovery has set in at the South, we think there can be no question. When even Jefferson Davis preaches not only resignation or acquiescence, but cheerful adhesion to the new régime, we cannot be far wrong in supposing that the South will be ready to make its contribution to the general rejoicing next year. The importance of its contribution can hardly be overestimated. Indeed, it is safe to say that, with the South sullen, or hostile, or defiant, no efforts on the part of artists or manufacturers could have made the celebration of the anniversary anything but a hollow mockery, because with the South in this frame of mind the Union could hardly be called a success. A hundred years of independence of Great Britain is not the only or the principal thing to be rejoiced over next year. Mexico will before long have a hundred years of independence to boast of, and so will Guatemala. It is the results of independence that it is proposed to celebrate; and if the theory of the condition of the South which some of our benevolent friends at the North have been recently urging on our acceptance were correct —viz., that it was inhabited in part by ignorant and helpless Africans, and in the remainder by ferocious white robbers and assassins—the American Union would hardly be a phenomenon for civilized men to be glad over. For such a state of things the abolition of slavery even would be but a flimsy compensation; for the truth must be told that it is no great thing for a Republic which started on its career with the declaration that "all men are created equal," to succeed by the end of one hundred years in putting an end to chattel slavery within its own borders. Some of our anti-slavery friends are so dazzled with it that they can hardly see that we were called on to do more. But boasting of it at the Centennial, with the South in the condition Senator Dawes described, would be somewhat like the rejoicings of a community over the abandonment of piracy and the conversion of its population to the more peaceful pursuits of wrecking and counterfeiting. Of course, it was a great achievement, measured either by its difficulty or by its results, but it was an achievement rather to be rejoiced over at home than exhibited for the admiration of the world, just as a family might very well celebrate privately the reclamation of a drunken or reprobate son, but could hardly call in the neighbors to share in the festivity.

If the Centennial had come five or even three years sooner, it could probably hardly have been made the occasion of this restoration of harmony and this revival of common hopes and memories. The war was still too near, the South still too unused to the new situation, and the North too ignorant of the exact nature of the problem before it, for either to have frankly resolved to let bygones be bygones. As matters stand, if our internal politics had been shaped deliberately, during the past two or three years, in preparation for the Centennial, the work could not have been better done. Everything has apparently fallen out for the best. Even Hester, and Spencer, and Pinchback, and Kellogg, and Parker, and Moses have all contributed their share to the good work, and ought to have a place in the Exhibition as benefactors of the Union.

There is one other reason for rejoicing over the probable restoration of a community of thought and feeling between North and South, which probably many good people at the North will have some difficulty in appreciating, and which it is a little difficult perhaps to explain at the close of an article; but we shall come near an explanation of it when we say that the readmission to our politics of an element which has not taken part in the "advanced thinking" and general rage for social and political experimentation of the last twenty years, will be a great gain for the whole country. The dogged Southern conservatism of the last twenty years was, it is true, due to a bad motive, but it has left behind a temper of considerable political value, which may now serve us all in good stead. Incredulity about the possibility of enormous social improvement through legislation is by itself an evil; but mixed with so much faith in legislation as has crept into Northern politics, it produces one of the main conditions of good government. Nearly all the real representatives of the South, belonging to the more enlightened class, are men who, either by temperament or training, are not only hostile to experiment, but have a strong faith in the traditions of Anglo-Saxon politics. Such men will have their use for many years to come, none the less because there are already numerous signs of the general subsidence of the spirit of vague political aspiration at the North, and of a decided growth of sobriety. All the recently made constitutions recognize, in a tolerably marked way, the difficulty there is in changing human nature rapidly, and the persistence of certain weaknesses in it which earlier legislators perceived and provided for about as well as is possible, as we now begin to see.

## SOME PLAIN TRUTHS ABOUT THE SCANDAL.

THE appearance in the New York *Times* of a full-page "statement" from a son of Mr. Henry C. Bowen with regard to his father's connection with the Brooklyn scandal, coupled with the evident determination of some of the newspapers not to be concluded by the verdict in the case now pending before Judge Neilson, seems to threaten us with what may be called a long appendix to the main charge against Mr. Beecher, in the shape of a body of

very minute, vulgar, and disgusting addenda concerning such portions of his life and manners, and those of his interesting flock, as have not been fully revealed to the long-suffering public. The *Tribune* having carried off the honor of most fully reporting the trial, the *Times* and, we dare say, plenty of other papers are thirsting for the honor of showing, by additional particulars of their own collection, that the whole case was not brought out in court, and that everybody who wanted to know "the true truth," as the French say, would do well to listen to their enterprising and veracious reporters.

Our readers know that we have refrained carefully ever since the case came before the jury from any comment or allusion to it which would betray a leaning either to one side or the other. Whatever we have said about it has been said by way of protest against an appearance of shirking, evasion, or suppression. We have urged in the public interest that the enquiry should be full, that the defence should not be technical, and we are bound to say that, on the whole, the public has not had much to complain of. Evidence has been admitted pretty freely and, our lawyers might and do say, loosely. If the jury cannot make up their minds, it will not be for want of material for the formation of a judgment. As to what their verdict ought to be, we have no more intention of expressing an opinion now than we had a month ago. We have not changed our minds as to the propriety of supplementing the discussion in court by discussion in the newspapers, and we shall reserve what we have to say on the main question until the jury have either agreed or disagreed. We refer to the case now for the purpose of bringing to the notice of all persons who may still be of opinion that they can promote their interests, or satisfy their hates, or feed their passion for notoriety, by fresh contributions to the odious literature of this scandal, the fact (which those most immediately connected with it may not have perceived) that a considerable change has taken place in the public mind with regard to it. They must not, for instance, presume any longer on the popular curiosity which caused the earlier "statements" to be so eagerly read, and which caused their charges and countercharges to be weighed in every household in the country with an anxiety which it is no exaggeration to call painful. *That* has unquestionably died out. There is, no doubt, still an appetite for fresh details, and if Mr. Bowen takes it into his head to supply them, undoubtedly he will find readers in abundance for the kitchen gossip about his wretched quarrels with his pastor and fellow-Christians of which his son gave us a specimen the other day; but it is the appetite to which the *Police Gazette* and the *Sunday Mercury* pander. What we mean to say is, that the desire to hear about the relations of the pastor and brethren of Plymouth Church to each other which marked the earlier stages of this painful investigation, has disappeared amongst all that portion of the American public whose opinion is of any consequence, or which can make or mar the reputation of any man or body of men.

The reason of this change, as we see it, we shall give frankly. It is that the Henry Ward Beecher who is now fighting Tilton in the Brooklyn court-room, and over whose doings Mr. Evarts and Judge Porter are so eloquent and ingenious, is not any longer the Henry Ward Beecher whom Tilton assailed last summer, to the horror and astonishment of so many millions. He may be still pure and pious and much belied, but he is unquestionably not the same man in the eyes of the American people. It is due to them to say this. A decent regard for their public and private reputation requires it to be said. They would not, we venture to affirm, have greatly cared last August whether the Henry Ward Beecher revealed by the evidence on the trial had or had not "invaded the home" of Theodore Tilton, as that has been described on the trial, or how all the Brooklyn busybodies lied to each other, and gossiped about each other, if they had known them all then as they know them now. The person over whose sins that great wave of excitement passed through the country, we now find, did not exist when Tilton began his lamentations. We all thought of Henry Ward Beecher not only as a good man, but as a man of almost unequalled sagacity and experience in dealing with the problems of life, and to whom concealment, or prevarication, or the suggestion to others of things that were not true, or association with men whom he could not respect, would have been abhorrent. We now know, on his own confession, that we were greatly mistaken about him; that his experience of life has brought him little wisdom; that he faced a parcel of conspirators and extortioners with as much cowardice and subterfuge as if he were a silly boy; that he consented to be their partners in a game of concealment which involved falsehood in some degree and in some form at almost every step; that he remained on friendly and even affectionate terms with them after he was satisfied that they were guilty of the lowest baseness; that he had so little sense or discretion as to flatter a silly, uneducated woman into an unlawful passion for him, and had not the moral strength, when he discovered it, to tell her that she was a fool, and he himself another, and that she had better find some other vent for her unholy worship. We are now telling the story as he tells it, and not as his enemies tell it, and we are not adding anything to its coloring. We know, too, that the religious community he has trained up in the five-and-twenty years of his pastorate is not marked by either Christian grace or simplicity; that it somehow has become in a remarkable degree a refuge for the unregenerate; and that its members, when produced in a court of justice, have given to the world a display of perjury which would have shocked the members of the Sicilian *mafia*.

These are hard things to say publicly, but they are things which the best men and women in the country are saying privately, and with great sorrow and disappointment. They are sick of the proceedings in Brooklyn, and have, in their disgust with the state of society which these proceedings reveal, lost all or nearly all their interest in the original question of Mr. Beecher's guilt. *That* the jury may decide pretty much as they please; and, no matter which way they decide it, the place the defendant once held in popular estimation will not be filled again by him. The verdict cannot re-establish him, because he is not the man against whom the public thought the charge was brought; nor do they in truth take any comfort in the theory of a conspiracy against Mr. Beecher which Mr. Tracy set forth so vigorously at the opening of the trial, even if it has been made out, because they cannot shut their eyes to the fact that, if conspiracy there was, Mr. Beecher himself was one of the conspirators. He aided in getting it up and carrying it out, and supplied whatever papers and declarations were necessary. The conspirators needed either to overpower their victim or impose on the public. Indeed, there is to our minds only one more sorrowful hypothesis than this one, and none which makes a more complete wreck of the peculiar kind of reputation Mr. Beecher once had.

Nor can they say to themselves that this was, after all, but the momentary weakness of a brave man at the close of a long and useful career, and find compensation for it in contemplating the results of his labors in the religious culture of his congregation; for assuredly the appearances of the members in this case have not furnished any very strong testimony under this head. Indeed, some of his own definitions and illustrations of "Christian character" in the court-room have been listened to by the community not only with surprise, but with indignation. Of one of the ways in which "Christian character" grows, he offered, while on the stand, Mrs. Tilton as an illustration, just after he had been telling the shameful story of her falsehood and treachery—telling that she had lied with deliberation and circumstance, for one of the basest purposes a woman could entertain. If Mr. Beecher thinks such a person a fair product of Christian culture, there are few who will not rejoice in the reflection that the scandal has destroyed his influence.

## THE TWO AMPÈRES.

PARIS, May 7, 1875.

IT is long since I have read a more interesting book than the two volumes of correspondence, just published, of the two Ampères—André-Marie the father, and Jean-Jacques his son. This correspondence extends from

the year 1805 to the year 1864. Ampère the father is better known to men of science; he made discoveries in the physical sciences which will render his name immortal. He found by instinct the relations between the electric and the magnetic forces, and verified the intuition of his genius by direct experiment. This is enough to place him among such men as Newton and Fresnel and Faraday. The correspondence shows him at the same time to have been the best of men, with the candor of a child, utterly devoid of selfishness, always forgetting the *moi* (which, says Pascal, is hateful), full of enthusiasm for every noble cause, devoted not only to science, but to his son, to his friends, very religious in the best sense of the word. He was very poor, and struggled through the greatest difficulties. It is hard to see a man like him, a soul open to every greatness, constantly borne down by the drudgery of life. Still, we will not pity him too much; for he was blessed with what must be to a man of heart the greatest blessing on earth —a tender and good son, of whom he could be proud. Ampère the son enjoyed in his time more popularity than his father, for he was a literary man and a man of the world; he reaped from his youth the advantages of a good name; the eternal rule, "sic vos non nobis," threw him at once into the most refined society in the world, and even if he had been a man of moderate talent his position would have been enjoyable. But he was himself far above the common level of men; he seems to have been able to imbibe every sort of knowledge, he understood all the sciences, he knew every language, he tried his hand at poetry, he wrote historical works. Indeed, this very facility was his great defect; he was a receiver, not a creator; his works of imagination are very deficient, while those in which his descriptive faculties are used, as well as his encyclopædic knowledge, can still be read with much profit and amusement. He travelled in almost every part of the world, and his impressions were always fresh and interesting. He stayed so long in Rome that he became almost an Italian, and his 'Roman History in Rome' is full of the most valuable knowledge. Still, I doubt if his fame as a writer will live long. There is a certain weakness in all his productions; he wrote too much as people speak, and he was perhaps the best talker of his time; but there is in his literary work something as evanescent as there is in a conversation. I enjoyed his personal acquaintance for many years, but I could see him but rarely, as he had taken a great dislike to Paris after the *coup d'état*, and spent most of his time in Rome and in Italy. His conversation was the best I ever heard—he was what the French call a *causeur;* he allowed, however, others to speak and to suggest new subjects. His wit was not that of many English famous talkers, who tell what are called "stories." Do you know the story about so-and-so?—this way of introducing a *bon-mot* has always seemed to me a little awkward. In dining with a celebrated English wit, it always seemed to me that I saw his "stories" come from too great a distance. The best were always prepared for the end of the dinner. "I hear you coming with your big wooden shoes" is a proverbial French phrase, addressed to people who introduce a subject too clumsily.

Ampère's wit was of a more volatile kind; his *esprit* had a natural flow, it was not cut up in slices; his stories, anecdotes, and *bons-mots* came naturally, without introduction, brought on, as it were, by the torrent of the conversation. He was almost unconscious of his *esprit;* he never tried to be more brilliant at one time than at another. He was extremely learned on a number of points, had an excellent memory, and to these advantages he joined the inestimable merit of having frequented intimately the best society which had survived the French Revolution. The history of his relations with the famous Madame Récamier throws much light on a time which seems already very distant; he was presented to her by Ballanche, his compatriot, in 1820. Madame Récamier was already forty-four years old, having been born in Lyons in 1777. Ampère was a very young man, but Madame Récamier, who had known his father and his family, received him with much kindness. He fell under the charm of the celebrated beauty, who from her youth to her death was always surrounded with adorers, and who gently turned all her lovers into friends—the best of friends herself, a type of purity, of chaste coquetry, and of loveliness. She was married at an early age to a rich banker, who was like a father to her, and she lost in after-life the great fortune which he had brought her. She retired to the Abbaye aux Bois, which is a convent in the Rue de Sèvres, where some apartments were let out. There are no woods any longer in that part of Paris, but it still preserves a quiet and provincial air—that is to say, it did a few years ago. Madame Récamier never went out into the world, but she received every day a chosen number of friends, and it was a great distinction to be admitted to this *cœnaculum*. Young Ampère of course fell in love with the charming woman who looked like one of the Madonnas of Raphael; who gave him the best of advice, helped him in his career, made him acquainted with the most distinguished people of the time. He soon became one of the happy few who always had a place ready for them at the Abbaye aux Bois. He brought her all the literary news of the day and the echo of the enthusiasm which had seized the younger generation under the Restoration. You will see by this extract what his state of mind was in 1821: "My will, Madam, no longer belongs to myself; I have abandoned it wholly to you. I will not claim it back, it is only too delightful for me to feel that something in my destiny can be decided by yourself and to look upon you as my providence." And again: "The more I know you, the more I love you; and the more I love you, the more do I feel the need to do so. My books, my projects, my successes, my annoyances, all are yours; you inspire and console and better me. I live by you."

The principal guest of the Abbaye aux Bois was at first Mathieu de Montmorency, who was Minister of Foreign Affairs till the Congress of Verona. His successor at the Foreign Office was Châteaubriand. The political differences of these two men became one of the troubles of Madame Récamier. Châteaubriand was very irritable and proud, and by degrees he became, I will not say the tyrant of the Abbaye aux Bois, but the gentle nature of Madame Récamier gave way to him. Young Ampère could not help being jealous of the author of 'Atala' and 'René,' for whom Madame Récamier exhausted all the resources of friendship. But how could Madame Récamier, who was no longer very young, be led away by the juvenile ambition of Ampère? She loved and respected in Châteaubriand a man of genius, the man who had dared to resist Napoleon after the assassination of the Duc d'Enghien, who was surrounded by the halo of glory and of misfortune. Driven away from France by the Revolution, he had fought with the *émigrés*, had travelled in America, on the Mississippi; he had known the most dreadful misery in London; and now he was the first orator in the House of Peers, and his haughty language was a match for Canning. Madame Récamier never fell in love during her long life; but if there was one man who ever had a complete empire over her soul, it was Châteaubriand. Ampère had therefore to content himself with holding only a secondary place in the circle of the Abbaye aux Bois. He accepted this rôle, and remained attached to his idol to the end of her life. He once offered to marry her, but she refused him, as she refused Châteaubriand himself, after his wife had died.

In 1823, Madame Récamier goes to Italy; Ampère goes with her and the faithful Ballanche. The correspondence seems to show that at that time the handsome Juliette (she was better known under that name in her circle) was flying from Châteaubriand, who had become too pressing and too dangerous. They stop in all the great cities, visiting the museums together. Madame de Récamier in Rome lived on the Piazza di Spagna, in the company of the Duc de Laval-Montmorency, the painters of the French Academy, Guérin, Schnetz, Léopold Robert. "This journey," wrote Ampère to his father, "will influence my whole life." He became enamored of Rome; he felt very keenly the poetry of its ruins, its solitary grandeur, the elegance and majesty of the country which surrounds it. "The two monuments which strike me most are Saint Peter and the Colosseum. . . . It is something unique this dome always visible, which is seen seven leagues from the city, before you see the city itself; it is the complement of everything in Rome, like the sun in the sky." "The Colosseum is a world of ruins; all the accidents which can be produced by light, vegetation, time, are there." This enthusiasm has been felt by almost everybody in Rome. After the first great impressions came the study of every detail, the first preparation for that book which became really the book of his life, 'Roman History in Rome.'

While the travellers visited Naples, Pompeii, Ampère the father was made professor at the Collége de France. He was already professor at the Polytechnic School. He announces the good news to his son, and tells him that it has been spoiled for him by the announcement made to him by his sister (who kept his house) that he is in debt to the amount of four thousand francs. He had spent too much money in instruments, in experiments. It is painful to think of such a man struggling with such difficulties. Ampère, on his return from Italy, kept house himself for his father, but he was no better fitted than his father for such work. He used to go himself to get the wine in the cellar. These details are not unimportant, as they show how much simplicity there remained in the life of such men as the friends of Madame Récamier, who daily associated in her house with foreign princes, ambassadors, etc. This plain, patriarchal, domestic view of life is not at all incompatible with the highest culture. The worship of money and the habits of luxury of our time were unknown to the families who had lived through the hard times of the Revolution and the Empire. Even now there is much simplicity in French life. The relations of servants and masters are not as friendly as they were in old times, but it is the fault of the servants as much as of the masters.

Ampère had left Madame Récamier in Italy; he writes to her from Paris despairing letters, urging her to return; he cannot live without her; he feels that his life has no object; he works without a purpose. Her answers are not given in the volume published. Judging from the letters of hers I have seen, they must have had the effect of a quiet, soft rain on parched grass. Every time she has written a line he seems a little less uneasy. At last, she comes back; but it is a settled thing he can, he ought to expect nothing from her but a devoted friendship. It is extraordinary to find a woman inspire such passion in the autumn of her life; but Châteaubriand was even more enraptured than Ampère, and the Duc de Laval said once, speaking of Madame Récamier: "Ils n'en mouraient pas tous, mais tous étaient frappés"—a citation from one of La Fontaine's fables. It seems to have been the destiny of Ampère to be the shadow of some adored person whom he could not call his own. When Madame Récamier was dead, he thought for awhile that all was over with him; but after some years he contracted a second moral marriage, if I may so express myself. He became the intimate friend of a young lady who was obliged to spend her winters in Italy, as she was attacked with consumption. This lady had not the beauty of Madame Récamier, but she was agreeable, very refined, and her immense fortune allowed her to be a patron of art in Rome. Ampère spent a few years with her, together with her mother and father, who lived in the hope of rescuing the health of an adored daughter. He became, so to speak, a member of the family. It was at this period that he composed his last great work on Rome, and his 'Cæsar.' He was becoming old; he returned only from time to time to France; he had given his chair in the Collége de France to his friend, M. de Loménie. When Madame G—— died, he remained with her family; and when he died himself, he left to the mother and father of Madame G—— all his manuscripts and notes. The two volumes now published have been edited by Madame C——, the mother of Madame G——. They will be found interesting by all students of modern French literature. They also throw much light on the best side of French society. They will not much improve the reputation of Ampère: his literary life was, on the whole, a failure; he was always attached to a phantom in the world of ideas, as in the world of men.

# Correspondence.

## LIFE INSURANCE COMMISSIONS.

To the Editor of The Nation:

Sir: I should like a few words in reply to Prof. Newcomb's letter in the *Nation* of May 27. His percentage of commissions to premium receipts is altogether too high, the average being a trifle over six per cent., instead of ten per cent. as the Professor puts it, and the Mutual Life Insurance Company of New York even figuring commissions down to two per cent. of the premium. This average percentage might be materially lessened by the older companies undoubtedly if they were content to stop procuring new business, or were only to take such as came to them unsolicited. But if the Mutual Life were to close up its agencies to-morrow it would cost much more than the two per cent. it now does to collect its premiums. An agent may, and often does, collect premiums for much less than it actually costs him, because it brings him into contact with other persons who may become policy-holders, and also gives him the opportunity to urge an increase of insurance already effected.

I had occasion years ago, as an agent and later as an editor, to look into this matter of agents' commissions, and I have been unable to find a similar business in this country where this expense is so small as it is in life insurance. In fire insurance, which is comparatively unsolicited, the agents' commissions are more than double those in life insurance. The Connecticut Report, which lies before me, gives the commissions to premium receipts of over one hundred of the best-managed companies in the country at 15.31 per cent. These are all stock companies, managed in the interests of their shareholders, and it is fair to assume that their business is as economically conducted as it can be.

As to the comparison of the English companies with our own in point of expense, it is very much like comparing the expense of a steam-engine standing still with that of the same engine at full speed, and arguing in favor of the economy of the former condition. The old English companies are at a standstill or rusting out, ours are growing. American life insurance need not fear any fair comparison with the business in England or elsewhere. It has made better returns to the insured than have been made in England or France or Germany. As I have reviewed Prof. Newcomb's paper elsewhere, and do not desire to weary the readers of the *Nation* with this discussion, permit me to conclude by saying that, having been both agent and editor, I know how much easier it is to criticise the agent than to do his work.—Respectfully yours,

H. R. Hayden,
Editor *Insurance Journal*.

Hartford, Ct., May 29, 1875.

## A STRUGGLING "INFANT INDUSTRY."

To the Editor of The Nation:

Sir: Permit me to use your columns to call the attention of the citizens of our common country to the wrong perpetrated upon us by the Congress of the United States. We refer to their iniquitous action in passing a bill to admit *bolognas* free of duty.

We have always been in favor of free trade *as a theory*, but this act strikes such a vital blow at one of our most essential and struggling infant industries, that we feel that when it is thoroughly ventilated there will be such a howl of indignation that the bill will be repealed. What is to become of the vast amounts of capital and labor employed in making the machines for cutting and stuffing bolognas if we cannot have protection against the unprincipled competition of the hordes of starving German artisans? Who will buy the wheat of the farmer or the iron of the miner unless we can make the draw-cut butchers' machines, and sell for what profit we please? For if foreign-chopped bolognas flood our markets, our shops must be closed, and we and our poor handful of dependent artisans and their interesting wives and children must starve. Up to this time, from here in the heart of the country, we have sent our machines to Germany and other foreign countries, thus relieving the balance of trade and the flow of American gold abroad.

But I have written enough; a hundred such arguments will occur to patriotic editors and citizens why this bill *must be repealed*.—Truly yours,

S. R. Bartlett, Sup't.

Murray Iron-works, Burlington, Iowa, May 22, 1875.

# Notes.

Centennial literature continues to multiply itself. Mr. Abner C. Goodell, jr.'s 'Address at the Centennial Anniversary of the Meeting of the Provincial Assembly in Salem, Oct. 5, 1774,' has been published in elegant style by the Essex Institute. It is a very clear and graphic narrative of the events which led to the meeting of the Assembly, and of those which immediately succeeded it. A natural sequel to it is the Rev. Grindall Reynolds's article on the "Concord Fight," reprinted from the *Unitarian Review* and published in pamphlet form by A. Williams & Co., Boston.——The sale of the remarkable library of Mr. Thomas W. Field occupied five days last week, and the sum realized (between $13,000 and $14,000) is so far below the worth of the collection as to be one of the best evidences of the straitness of the times. There is some consolation in low prices for humble collectors and libraries, and we hope this reflection may not be without its comfort to Mr. Field. We may look for a review of the sale from Mr. Sabin (under whose auspices it was conducted) in the next *Bibliopolist*. The catalogue is well worth owning; it appears to be more accurately printed than the 'Essay towards an Indian Bibliography,' from which most of the titles are reproduced.——Bernard Quaritch, Piccadilly, London, invites subscriptions to the third and revised edition of 'Pugin's Glossary of Ecclesiastical Ornament and Costume' (1 vol. imperial 4to), at £5. It will contain seventy-four illuminated plates, and be bound in half-morocco ——'Frondes Agrestes' (readings from Ruskin's 'Modern Painters' selected by a lady among the author's friends) will be published by John Wiley & Son.——D. Van Nostrand announces a 'Practical Treatise on Roads, Streets, and Improvements,' by Gen. Q. A. Gillmore.——'At Capri,' by Carl Detlef, a story of Italian life, is in the press of Porter & Coates.——Roberts Bros. announce, for July, Jean Ingelow's 'Fated to be Free,' a sequel to 'Off the Skelligs.'

—We have received from Mr. John K. Tiffany, of St. Louis, a copy of his privately printed 'Philatelical Library: a Catalogue of Stamp Publications.' He has, as he states, been an ardent stamp collector for fifteen years, and owns most of the works he here catalogues. These number, in the first part, 539 titles, the American taking the lead with 211, the English coming next with 180, the Germans third with 102, and the rest being French,

Dutch, Italian, Spanish, and Danish. In Part II.—price lists—some Russian also are mentioned. Part III. is perhaps the most valuable of all, embracing mention of articles, etc., on stamp collecting, the history of stamps, of postal reform, and of the Post-office itself; and lists of postal periodicals and guides, of postage-stamp games, postage-stamp music (!), and postage-stamp photographs. The first title under this last head is: "Our Bleeding Country's Infernal Revenue Stamps." No less than five published manuals relate to the forgery of stamps, some idea of the extent of which may be gathered from title No. 367: ". . . . descriptions of nearly 700 forgeries, exclusive of essays and chemically changed stamps." The 'Philatelical Library' is printed in their best manner by John Wilson & Son, and is a handsome monument of the compiler's industry and painstaking.

—Some one (we do not quite make out whether it is a man or woman) writes with an easy familiarity on "Concord Books" in the June *Harper's*. The article is biographical as well as bibliographical, and the homes and faces of Concord's literary magnates are freely illustrated by the engraver, whose portraiture is fairly good. Thoreau's, however, is faithful rather to his youth than to his grisly latter years. Least known of all the writers mentioned is John A. Stone, who about 1828 composed the play of "Metamora," which furnished Forrest with a celebrated rôle, he paying five hundred dollars for it, as he afterwards did twice that sum for a second drama by the same author, called "The Ancient Briton." Hawthorne's first romance of "Fanshawe" appeared in 1832, and after that the town began to make its mark in literature, and has not yet left off doing so. Another of the half-dozen illustrated papers which make this number of the magazine peculiarly attractive is one on "Cape Cod, Nantucket, and the Vineyard." It is in Mr. Nordhoff's best vein, and is partly the product of personal observation, partly of some judicious pickings from local histories. Martha's Vineyard is barely mentioned, but of Provincetown and Nantucket we learn much that is worth knowing. These barren spots were once covered with a flourishing vegetation, and when the Pilgrims landed in Cape Cod Harbor, November 11, 1620, they found the present site of Provincetown "covered with large oak and walnut trees, which were used for ship timber and lumber, and pine-trees, which were tapped for turpentine." The colonists too late discovered the consequences of their reckless destruction of this bulwark against shifting sands and encroaching waves. Of the black-fish, often caught in the harbor, Mr. Nordhoff says that a singularly limpid oil is drawn from their jaw-bones, "which is used by watchmakers all over the world to oil the works of watches." Yet the total consumption is "only about two hundred gallons yearly, most of which is produced, or, more correctly, saved on Cape Cod." Provincetown "has a considerable population of Portuguese, who follow the water for a living, and give a foreign air to the town." The first of a series of articles on the "Wit and Wisdom of the Haytians," by Mr. John Bigelow, shares the common failing of collections of proverbs where an attempt is made to avoid a mere catalogue. It is rather needlessly explanatory, and rather solemnly didactic, but there are many apt comparisons of the proverbs of other countries with those of Hayti. None of the latter thus far cited by Mr. Bigelow seems racier than the "Pravette pas jamain gagné raison devant poule"—the cockroach is always wrong when it argues with the chicken. A parallel sentiment Mr. Bigelow finds in the wolf and lamb of Æsop; another, equally classical, is that of the Roman who would not discuss with the master of forty legions.

—In the *Galaxy* for June we have found Dr. T. M. Coan and Mr. R. G. White to be the most readable contributors. The latter, who seems to have lately undertaken the double task of instructing the public in the science of music and of demonstrating to them at the same time that music is an art and not a science, writes in this number an article reviewing Mr. Sedley Taylor's interesting treatise on harmony, which we see has been republished by the Appletons, and a book called 'What is Music?' by Isaac L. Rice, published by the same house. Dr. Coan, in his "complaint of printing," discusses, in a vein which is a little too like the satire of Matthew Arnold to be mistaken for him, a very old subject, the abuses of free printing. It is a dangerous vein to write in, for the manner consists in saying nothing positively of what you undertake to discuss, but of throwing out many evident and extremely pointed hints as to the direction in which you would dogmatize, if you ever should be so brutal and philistine as to dogmatize at all. Irony is, however, not merely a dangerous figure, but to be successful needs a good deal of force behind it in the way of moral indignation or contempt, and it is perhaps in this motive-power that Dr. Coan is lacking. We must confess that when we hear a new essayist beginning to write upon the well-worn theme of the press and its abuses, we have a longing to ask him the extremely vulgar question, "What are you going to do about it?" The press is not a beautiful institution altogether, and it no doubt has talked a great deal of nonsense about itself, has exalted and puffed itself up; though even its own self-laudation could, we believe, be easily matched by what has been said of it by admirers who hoped for its support in politics, in the church, or at the bar. But, in any case, there it is. For some reason or other, the modern world must have its newspaper, and so long as this remains true will the editor continue to have editorial columns, to talk to his audience, to exhort, denounce, praise, and blow his journalistic horn. The only thing that can be done with it is to improve it, and to complain of its existence is very much like complaining of the sewing-machine because sewing-women are sometimes swindled, or of railroads because they carry a howling locomotive through picturesque solitudes. However, we sympathize entirely with Dr. Coan in the main drift of his remarks, which is, that the importance of the press has been very much overestimated; that, in fact, there has been a sort of general conspiracy to make us believe in a salvation by journalism, when it must always be an absurdity to suppose that the world is going to be very much changed for the better or the worse by the fact that everybody can, if he pleases, and can find the money, keep a printing-press going.

—It is well enough known that portraits called life-size are not really of life-size nor anything like it; artists are commonly satisfied to explain their use of such a scale in portraiture by saying that it is a conventionalism. But Mr. Hamerton, in the May *Portfolio* (J. W. Bouton), remarks that the question is exceedingly embarrassing to him. A life-size piece of statuary, he says, he understands to be really such when it measures identically with the proportions of a man; but he tells how, when he was shown a painted portrait which measured similarly with its model, he said and maintained that it was larger than life. The picture-frame may be conceived, he thinks, to represent a frame of plate-glass, upon which an artist has traced the man's head on the scale it would appear to have if set conveniently behind the glass. Now, it is true that this tracing would be in much-diminished perspective as compared with the aperture and width of the picture-frame, if we imagine frame, model, artist, and spectator to be all within arm's length of each other. But suppose the frame is hung where the owner is going to hang it, at some height over the chimney-ornaments, then the imaginary distance of the head behind the frame, by the removal of the whole apparatus of frame and head, would seem to be less, and the perspective not so precipitate; and are we to conceive that the subject himself, looking through his frame as through a window, with his face at its level, would be larger than life? At any rate, Mr. Hamerton, as at present advised, appears to consider that his host's sculptured head, if done to measure, is life-size; but that his host's painted head, if done to measure, is gigantic. Perhaps he will some day succeed in disembarrassing himself, and will tell us the steps of that process; and meantime, we may try to be content with the artist's usual explanation of conventionality. In concluding his article, the critic adroitly points out that if we could look at the moon as we do at objects from a tower, at a distance of 240,000 miles beneath us, we should be much surprised at its apparent smallness. In the same *Portfolio* Mr. Hamerton describes the etchings of M. Lalauze, in a series called "Le Petit Monde," and gives a specimen. The other etching in the number is by Mr. Wise, after Landseer's very-well-known work called the "Sleeping Bloodhound," which it appears is not really sleeping but dead, being a portrait of Mr. Jacob Bell's dog "Countess," after she had killed herself by falling over a balustrade at Wandsworth.

—The discovery of an unsuspected man of genius is always an interesting event, and nowhere perhaps could such an event excite a higher relish than in the æsthetic city of Boston. Many people just now in the New England capital are talking of Mr. Frank Duveneck, and incidentally of Velasquez. Mr. Duveneck is a young painter of great promise, a native (we believe) of Cincinnati, where he is now living, and lately a student of the Munich Art-School. A specimen of his work, not long since, found its way to Boston, and excited extreme interest. He was invited to make himself better known, and he accordingly sent five pictures to the exhibition now open at the rooms of the Boston Art-Club, where we have lately seen them. They are all portraits, and they have strongly confirmed the high opinion formed of the young artist's talent. It is a talent of an interesting order, and though as yet in an immature phase, it is full of vigorous promise. Mr. Duveneck is a painter of the rigidly natural school; unadorned reality is as yet his exclusive theme. These five portraits are indeed singularly real and natural. They are all male portraits—one at least is a head of a

baby, whose sex is not apparent—and they are also thoroughly masculine in execution. Mr. Duveneck's models happen to have been very ill-favored persons, and he has reproduced them without a hint of compromise or arrangement. The most important picture is a full-length of an old man seated, with his hat on, in a sort of Shaker arm-chair, dressed in plain, ill-made dark clothes; another is a half-length of a rather "seedy" young man in a black slouched hat, holding the stump of a cigar; a third is a full-face of a German professor, of an extraordinarily characteristic type. There are no accessories; the handling is of the broadest and freest kind; the color ranges through only two or three variations of black or gray; but the relief, the vigor, the frankness, the comprehensive simplicity, are most striking. Mr. Duveneck, on the exhibition of these works, was, we believe, invited to come to Boston, where a dozen immediate orders for portraits were assured him. After reflection, he declined the invitation, and decided that before producing on this large scale he needed to fortify his foundations. He is now about to return to Europe. This, doubtless, is the wisest course, and it would be a serious pity that he should adopt any but the wisest. We confess that, as things stand with us at present, almost any young artist of promise is likely to do better out of America than in it. We are fatally prone, in such cases, to use the superlative degree when the comparative is abundantly adequate, and to force second-rate power, even against its conscience, into attempting tasks of first-rate magnitude. But wherever Mr. Duveneck may establish himself, we wish him all prosperity. We should be very sorry to fall into the vice we deprecate, and begin to talk out of season in superlatives; but we repeat that these five portraits are, in quality, of signal interest. They lack, certainly, a dozen things—most of which the painter is probably quite conscious of; but they possess the great, the all-important quality—the air of the artist's having the temperament, the natural instinct, of his business; of the whole man infusing himself, without a scruple, into his effort. This is what makes (after years of labor) the work that is supreme in its kind. We learn with pleasure that it is proposed to bring these pictures to New York, and place them temporarily on exhibition. We hope, for the sake of every one concerned, that they will encounter perfectly adequate appreciation, but that it will be remembered that Mr. Duveneck is very young, and that if we praise him too lavishly now we shall have nothing left to say about him twenty years hence.

—Professor James D. Butler writes us from Madison, Wis., as follows: "The London *Academy*, of April 17, in the section of Notes and News, falls into a blunder which deserves exposure, or at least correction. Concerning the prostrate needle of Cleopatra, we there read thus:

"'The different estimates given of its weight are curiously divergent, varying from 700 tons downwards. *The actual weight of the column must be between eighty and ninety tons;* it is sixty-six feet high, seven feet seven inches at the base, cut out of one block of granite.'

Now it seems clearly demonstrated that this mass cannot weigh less than two hundred tons. Every one who has seen an Egyptian obelisk, even in photograph, knows that it tapers very slightly. The obelisk of Luxor, at Paris, according to Galignani, from a base of ninety inches square falls off only to sixty-four inches on a side. The Alexandrian obelisk may be presumed to diminish in the same proportion, like all the thirty-one others of Egyptian origin now erect and engraved by Bonomi in the Transactions of the Royal Society of Literature. If this be so, the Alexandrian obelisk has a width at top of 64.711 inches, its mean size is 77.855 inches square, which is 43.4812 feet, and being 66 feet long its solid content is 2891.75 cubic feet, or 239.78 tons. I am not ignorant that the normal apex of an obelisk is a pyramidion which grows sharp suddenly. But the fallen needle is five feet shorter than its erect sister. Possibly, this difference results from its pyramidion being broken off, as that at Paris is in part. But suppose the Alexandrian pyramidion to remain intact, it hardly extends further from the apex than the width of the base. If such is its size, the cubic feet below the pyramidion will be 2525.53, weighing 209.4 tons. The pyramidion is also a part of the same monolith. Its content is 73.50 cubic feet, and its weight 6 tons. Accordingly, the data furnished by Galignani and the *Academy* require us to believe the weight of the 'needle' to be at least 215 tons, or nearly three times as much as is stated in the *Academy*. The material of the monument in question is red Egyptian granite, which, on the authority of the 'Encyclopædia Britannica,' I have reckoned to weigh 165.875 per cubic foot."

—The vitality of the population of France as compared with that of the Prussian people has been made the subject of a statistical sketch by Freiherr von Firks (Berlin, 1875). According to this writer, the census of 1861 gave 18,491,220 inhabitants to Prussia, and to France (not yet stripped of her Rhine Provinces) 37,472,732; that of 1867, 19,671,841 to the former, and 38,284,470. In the interval, therefore, Prussia had increased her population by 6.99 per cent., France only by 2.37 per cent. In 1869, Prussia, having extended her territory, counted 24,325,405 souls; France, 38,469,282. During the eleven years 1860–1871, Prussia showed on an average 39.762 births (including still-births) to every thousand inhabitants; France, 27.480. More infants proportionally were still-born in France than in Prussia; and though French marriages are more frequent (by three to four per cent.), the ratio of living births to marriages is inferior by one to two per cent. What is specially noteworthy is that in Alsace-Lorraine this ratio of births to marriages, while it falls below the Prussian, exceeds that of France, thus furnishing a measure of the loss sustained by the latter country in reproductive energy. On the average, the excess of births over deaths in Prussia (1861–69) was nearly 12 per thousand; in France, little more than 3. Herr Firks also sets forth the marked extension of clerical instruction in France in connection with some suggestive statistics of illiteracy among the army recruits. In the matter of *analfabeti*, however, France has still something to boast of in comparison with the country which invented the term. If twenty-four Frenchmen in a hundred from 6 to 20 years of age, and thirty-one in a hundred from 6 upwards, do not know how to read, there are, according to the latest official census-reports, sixty-seven and sixty-eight Italians in the same classes respectively who have no use for the alphabet.

—Three numbers of Dr. Martin Waldeck's monthly journal of current politics, *Die Zeitgeschichte*, are now before us, and abundantly confirm the expectations of its utility which we formed on the first announcement of its publication. In plan, it differs from every other political review with which we are acquainted in being a daily record of facts, and not a vehicle of comment, discussion, or prophecy on the part of the editor. Typically, therefore, it stands in contrast with the *chronique* of the *Revue des Deux Mondes*, and with all similar retrospects; indeed, properly speaking, *Die Zeitgeschichte* is not a retrospect at all, but a diary, which is closed not too soon after the end of each month lest some event be omitted on account of the slow travelling of the news of it. Telegraphic despatches are chiefly depended upon for information in regard to distant states; but for Europe the newspaper mails are Mr. Waldeck's main reliance. He gives copious extracts and even whole articles from the German press; very full abstracts of the debates in the Imperial and Prussian assemblies, and occasionally entire speeches of Bismarck and other ministers; and the complete text also of many important pieces, such as, in the three numbers before us, the Emperor's short response to the New-Year congratulations of his generals, MacMahon's message (Jan. 6), Gladstone's letter of retirement to Granville, Grant's abortive message on Arkansas (Feb. 23), etc., etc. After the United States has been recorded, a page or less generally suffices for the rest of the world. German affairs naturally occupy much the largest space, in the proportion of about two-thirds. Such is a general account of Part I. ("Fortlaufende Monats-Chronik der Gegenwart"), though it remains to be stated that not always incidents but sometimes freshly published statistics are admitted to the diary, *e.g.* (p. 148), the number of Catholic orders in the several states of Germany, and (p. 230) the condition of the national debt of Italy. Omissions are repaired at the end of every quarter by means of addenda, and typographical and other errors are corrected in the same issue. (On page 236, by the way, the first errata reference to p. 127 should be to p. 117.) Part II. of the *Zeitgeschichte* is made up of documents which throw light on contemporary diplomatic history. Thus far it has contained only letters of the Berlin correspondent of the London *Times* in 1868, exposing Napoleon's intrigues in the Danubian Provinces at that time with a view to the isolation of Prussia. The value of this periodical to politicians of the better sort and statesmen is obvious, and it is scarcely less to journalists. Especially will it be convenient for the latter to have what the editor promises at the end of the year, viz., comprehensive chronological tables for the course of events, and exhaustive indexes of topics and of names. The *Zeitgeschichte* may be had through L. W. Schmidt, 24 Barclay Street.

—Two recent appointments in the University of Zürich seem to merit notice, as signs of the times. One is that of Professor W. Wundt to the chair of philosophy, the other that of Professor E. Hitzig to the chair of psychology. Wundt has long been occupied at Heidelberg, first as assistant, then as "ordinary" professor of physiology, whilst Hitzig has been a medical practitioner and lecturer on electro-therapeutics in Berlin. So far as we know, the latter has written nothing on purely mental science. His discovery of the irritability of the surface of the brain is his chief title to fame; all that he has written shows erudition, great experimental thoroughness, and conscientiousness in drawing inferences. Wundt is one of the most learned of German investigators. His own special work has lain

most in the line of the senses and the nervous system, the territory common to mind and matter; and all the elements of his training hitherto unite to make him an eminently well-qualified teacher of mental science. Indeed, we doubt not that his long apprenticeship in physiology was accepted by him merely that he might be the better educated for philosophy. In this country such appointments would probably provoke a good deal of orthodox alarm. But in Germany not only is thought more fearless of consequences, but "camps" in opinion are much less clearly defined, and materialistic and spiritualistic tendencies keep house together most amicably in the same professional brains. We cannot help regarding such appointments as these as hopeful tokens of a new era in philosophical studies—an era in which the old jealousy between the subjective and the objective methods shall have disappeared, and in which it shall be admitted that the only hope of reaching *general* truths that all may accept is through the co-operation of all in the minute investigation of special mental processes. We may then see solid philosophical conclusions gradually emerging from the mass of discoveries of detail, just as happens in the sciences more especially recognized as "inductive."

## LORD SHELBURNE.*

LORD SHELBURNE'S character is an enigma. He was known during life by the nickname of "The Jesuit" or "Malagrida." Goldsmith's blundering remark, "I wonder why they call *your lordship* Malagrida, for Malagrida was a very good man," may be stripped of rudeness by a change of emphasis, but remains a permanent record of contemporary opinion. Nor did the judgment of colleagues differ from the estimate of the public men who, agreed in nothing else, agreed in distrust of Lord Shelburne. The causes of this distrust are at first sight not very obvious, for it would be difficult to make out that his lordship's conduct fell much below the then current standard of political morality. The fact, however, remains that politicians who would act with Henry Fox, with Chatham, or with Bedford, felt an unconquerable suspicion of "The Jesuit," and distrusted his truth more than other men's lies. But Lord Shelburne is remembered by posterity rather as a patron of literature and philosophy than as a statesman. He made the acquaintance of Johnson. He introduced Blackstone to the King. He sought out and dragged from obscurity the unacknowledged genius of Bentham. The names of his philosophic friends sufficiently prove his discrimination, and he had qualities rarer in a patron than even the gift to detect unrecognized talent; he certainly inspired affection. The attachment of Bentham was strong and lasting. "He raised me," Bentham used to say, "from the bottomless pit of humiliation, and made me feel I was something," and the days passed at Bowood were the happiest of the philosopher's life. How did it happen that the same man was the tricky politician whom nobody could trust and the enlightened patron of philosophic talent?

To answer this question fully would be to write the life of Lord Shelburne, but the first volume of his biography, and especially the curious autobiographical fragment with which it commences, suggests at any rate a reply to the enquiry which must have often perplexed students of the politic of the last century. The problem cannot be solved by assuming, as apparently does Lord Edward Fitzmaurice, that his ancestor's political career has been misrepresented, and that the patron of philosophy was a virtuous statesman whose reputation was sacrificed to the slanders of Holland House. No idea can be more idle. It is possible that Lord Shelburne was not guilty of the perfidy imputed to him by Fox. The exact history of the so-called "pious fraud" can never now be known, and is not worth the knowing. Fox told one tale, Shelburne told another, and there is no more reason to trust the word of the first Lord Holland than to trust the word of the first Lord Lansdowne. Lord Shelburne is condemned on far stronger evidence than any single assertion of a witness such as Fox. His first step on entering as a young man into public life was to act as a go-between in negotiations the object of which was to induce Fox to sell himself to the Court and undertake to carry through Bute's policy by corrupting the House of Commons. When it is apparent that Lord Shelburne gloried in his success as a negotiator, and aided and abetted transactions which were held infamous even by the lax political morality of an immoral generation; when it appears that he does not ever seem to have felt any regret for the part he played, it is positively futile to hope that by correcting a few dates or putting forward a few extenuating circumstances a biographer can show that the suspicion with which Lord Shelburne was regarded was unfounded. The piety of a descendant or the credulousness of a biographer may hope to whitewash Lord Shelburne's political character, but the calm judgment of history will pronounce that his lordship was a statesman whose moral tone was to say the least rather below the morality of his age, and students curious in the analysis of character will seek some other mode of reconciling the contradictory aspects of his career than the assumption that he has been the victim of slander. Nor will a careful study of the present Life fail to suggest how the reconciliation is to be effected. Lord Shelburne's autobiography gives the key to his character and explains the peculiarities of his career.

He was born, it may be suspected, with few of those qualities which the eighteenth century glorified under the name of a "good heart." His intellectual powers were considerable; his will was strong; and he received the worst education which combined neglect and severity could provide. Till he was fourteen he lived in a wild part of Ireland, and was left almost without intellectual training. One fact sufficiently shows the character of the society in the midst of which his youth was passed. His grateful recollection paints Lady Arabella Denny—the only person whom he loved or who loved him—as a woman endowed with "virtues, talents, temper, taste, true religion, and goodness of every kind." Yet this admirable lady, to protect herself from the outrages of a brutal brother-in-law, trained herself to become a first-rate pistol-shot, and threatened her tormentor with certain death if he did not desist from his insults. A sagacious schoolmaster warned the boy of fourteen that if he did not educate himself he might chance to go without any education at all. The lad had the vigor to act on the advice, and acquired for himself such learning as he ever possessed. When at the age of twenty-one he came into public life, he was, naturally enough, a disbeliever in the virtues of all men, high and low, who was determined to push his own way and not to be deceived by the pretended virtues of men in power. The freedom at once from the principles and from the prejudices of those with whom he associated, and the cynicism often found in youths or professors which arises not from knowledge of the world but from absence of enthusiasm and theoretical disbelief in human virtue, were, to judge from his acts and writings, fundamental traits of Lord Shelburne's genius. The sketches of statesmen which make up the most interesting part of the present volume, show that his lordship thought ill of every leading man with whom he came in contact. Lord Bute, his first patron, was "proud, aristocratical, pompous, imposing, with a great deal of superficial knowledge, a little metaphysics, and a very false taste in everything." "He was insolent, cowardly—the greatest political coward I ever knew; he excelled in managing the interior of a court, and had an abundant share of art and hypocrisy." Chatham, of whom Lord Shelburne became in later life the avowed follower, appears in his disciple's memoirs as a man mainly marked by cunning and affectation. "What took much from his character was that he was always acting, always made up, never natural, incapable of friendship or of any act which tended to it, and constantly upon the watch and never unbent." Chatham's affectations are notorious, but it remained for Lord Shelburne to insinuate that he was not disinterested. "He told me himself that the world was much mistaken in thinking that he did not like patronage, for he was but a little man in 1755 and had to act the part he did, and he proved sufficiently that he did by catching at everything that dropped in almost every department." Of Wolfe alone does Lord Shelburne speak highly, but Wolfe showed him great kindness, and Wolfe died young.

The cynicism of a youth who disbelieved in everything but intellect and success naturally led him to join in an intrigue which the prudence if not the scruples of a hardened statesman would have avoided. It is perhaps equally natural that Lord Shelburne should not have perceived the discreditable character of his first entrance into public life. Neither experience nor philosophy seems to have taught him the moral feelings with which most men are imbued almost unconsciously under the influence of education and sympathy. He used frequently to say to Bentham: "Tell me what is right and proper; tell me what a man of virtue would do in this matter." It is at least something that in later life, at any rate, he sought to acquire from others information perhaps inadequately supplied by his own moral sense; and the habit of learning even in advanced life points to the connection between the worst and the best side of Lord Shelburne's character and career. If he was deficient in some of the better sentiments of his contemporaries, he was also singularly free from their prejudices. His comments on historical characters are extremely striking. He appreciated to the full the capacity of Walpole, and perceived, what was hidden from most men of his time, the statesmanlike genius of Cromwell. He was in other points not only unlike but before his age. He entered into the theories of political economists, and showed an interest in that class of social questions which in modern times have nearly superseded the purely political

* 'Life of William, Earl of Shelburne, afterwards first Marquess of Lansdowne. By Lord Edward Fitzmaurice. Vol. I. 1737-1766.' London and New York: Macmillan.

interests of the last century. His respect for intellect and genius was so fully in keeping with the whole turn of his mind that one can hardly doubt that it was sincere, and in the main disinterested. He no doubt expected that the men whom he patronized would be serviceable to his ambition, but no one can read Bentham's life without seeing that Lord Shelburne had a genuine sympathy with intellectual pursuits and a desire to aid men of talent. Bentham's testimony is the more valuable because gratitude did not blind him to his lordship's defects. "Lord Shelburne," he writes, "had a wildness about him, and conceived groundless suspicions about nothing at all. I remember going to ride out with one of his servants, and being accosted by some man whom I spoke to out of mere civility, and on mentioning it to Lord Shelburne, he seemed to think I was deserving of suspicion." This wildness and suspicion are easily enough explained by his character and education. They may well ally themselves with that kind of caution which runs near to hypocrisy. The diary of Lady Shelburne tells how her husband "came up to me soon after breakfast and read part of a sermon of Abernethy." "Lord Shelburne avoided talking on religious subjects for fear, he hinted, of getting into a scrape, but he avowed to Bentham that his opinions were what is called sceptical." He was not, in short, called "The Jesuit" for nothing, but his merits, no less than his faults, were not those of his contemporaries. If he had lived a century later he might have been eminent and respected as a promoter of social science, and have indulged a taste for casuistry in the appropriate field of theological discussion.

## SPECULATIVE DYNAMICS.*

WHETHER when a body moves it is proper to say that it is *in* motion, or that the motion is *in* it, is a question often suggested by the language of even the most guarded writers on mathematical dynamics,† though the strictly mathematical definitions, formulas, theorems, and problems of the science are free from any ambiguity. With what meaning the preposition "in" is used in these expressions is a further and more pertinent question. If with that meaning which the unmathematical language of these writers seems to authorize, then they have really exposed themselves and their readers to the difficulty involved in Zeno's famous paradox of motion, namely, that since a motion must be either *in* the place of the moving body or *in* some other place, and since the moving body does not move *in* its place, and does not move *in* any other place, motion is really a contradiction, and therefore, according to logic, an impossibility. The solution of the paradox, for which the science of logic had to establish a distinct principle, recognized that in such expressions the preposition "in" is not properly used in a locative sense, but only in the vaguer sense of appertaining to or being predicable of its object. That a body *in* motion has the attribute of motion (that is, the attribute of having a continuously-changing distance from some other body, or from some position which is regarded as at rest, or as not having this attribute); and the other form of the same fact, namely, that the motion *in* the body is an attribute of the body—are equivalent or entirely accordant expressions of what is signified by the preposition "in." Zeno's paradox is logically solved in such terms as these: motion transcends the "sphere" of the locative, or is distinct from both the positive and negative or the contradictory locative meanings of "in." It is neither here nor there as a phenomenon, and yet is not an excluded middle, since the contradiction of this and some other place is a contradiction in relations, both of which are distinct from the nature of motion. Nevertheless, judging by the current language (not mathematical) and the past disputes of mathematicians on the definitions of force and motion—disputes which, having been settled within their own province, they have bequeathed to unmathematical speculators in dynamical philosophy—we should be inclined, at first sight, to allow that such speculators have the warrant of high authority for their attempts at revising the fundamental conceptions of this science. Whether consciously or not, the mathematicians of the seventeenth century and unmathematical sciolists of later times were impelled by this old paradox to a solution of its difficulty by a metaphysical or non-phenomenal conception of the "force of motion," so-called, as something locatively *in* a moving body, constituting the substantive or sustaining cause of motion; seeing that the phenomenon itself of motion, being a continuous change of distance from a fixed position, could no more properly be *in* a body than this very distance could be locatively *in* it.

Newton from the first, and all competent mathematicians of a later time, saw that the mathematical discussion of dynamical problems had no concern with any such metaphysical conception. The supposed cause of the uniformity of motion in a fixed direction which a body has independently of external relations or *vires impressæ*, is not any part of dynamical science. Moreover, the causes of change in the velocities and directions of motion, or these *vires impressæ*, were conceived in a purely phenomenal or descriptive way, and measured by actually visible and tangible quantities. It was not on account of any speculative inability in Newton to conceive a possible ulterior cause of gravity that he excluded from mathematical dynamics the search for it, or remained contented with the descriptive quantitative law of this action, but simply because such a research departed in a direction just the opposite of that which led to rigorously-demonstrated explanations of the observed phenomena of nature. If any of these phenomena could have led, "in a mathematical way," to the law of action in gravitation, Newton's genius would surely not have failed to deduce it from them. He took gravity with its law for an ultimate fact, simply because it did not follow as a consequence from any other observed laws in the same manner of mathematical deduction in which he had shown that Kepler's laws follow from it and from the three laws of motion. But even mathematicians, and especially those of Germany, whose men of science are even to this day more given to metaphysics than those of other nations, were for a long time haunted by the metaphysical spectre of a cause called the "force of motion," and supposed to be needed to keep a body agoing as well as to set it in motion or bring it to rest. The mathematics of this science, however, deals only with the defined or measured quantitative phenomenal conditions of persistence and change in motion; and the metaphysical mathematicians were so far true to their science as to seek for a measure of this metaphysical cause of motion. A fierce dispute accordingly arose in the seventeenth century, and was continued into the eighteenth, in which the most illustrious men took part, as to whether the "force of motion" should be measured or defined by the velocity directly or by the square of the velocity. But after a bitter contention, prolonged by the rivalries of national honor among European scholars, the question was finally seen to resolve itself into whether the name *vis viva*, or "force of motion," ought properly to be given to one or to the other measure. For all mathematical and experimental purposes, these measures were all in all, and were perfectly consistent as measures of different phenomena or relations of motion, if only called by different names. And it was seen that dynamical science could get along perfectly well without any use of the confusing word "force." But the word continues still to have at least four distinct meanings in dynamical science—technical meanings related to the use of the word in mathematical reasonings, which are never, however, confounded by mathematicians. All that is really common to them is a vague reference to the production or persistence of states of motion or rest. The real gists of their meanings are in the qualifying terms annexed to them, as in the *vis impressa* of Newton or the *vis mortua* of Leibnitz, otherwise called *vis acceleratrix*, the *vis insita* or *vis inertiæ*, the *vis viva*, and the *vis motrix*. In place of these names, modern treatises often use, without the substantive word, the terms *acceleration* (retardation being a *minus* or algebraically negative acceleration); secondly, *mass* (the coefficient of velocity, or of its square, in estimating either); thirdly, the *momentum*; or, fourthly, the *energy* of motion. But the term *energy* still has that metaphysical taint of vagueness, even with modern mathematical writers, which so long infected the word "force." It is still spoken of, both with reference to its actual and potential forms, as if it were something locatively *in* the moving body, or *in* a body capable of a defined motion; instead of being only predicably *in* the permanent internal and the special external conditions, which mathematically determine relative movements and their rates of change. It is not surprising that an unmathematical speculator in dynamics should be misled by such expressions as the following from the eminent authors, Professors Thomson and Tait, to which many parallel expressions in other authors might be added, namely, "A raised weight, a bent spring, compressed air, etc., are *stores* of energy which can be made use of at pleasure." A mathematician, knowing in what terms these antecedent conditions of motion are expressed and measured, understands them to refer only to sensible properties in these "stores," together with the restraining causes which also have sensible measures, namely, what makes them "stores," or holds the weight *up*, or the spring *bent*, or the air *compressed*. It is *in* the being held up, or bent, or compressed—*in* these antecedent circumstances, as well as in what is locatively in the bodies, that the storing of energy consists; and this energy is also dependent in the case of the raised weight on an equally sensible and measurable outward relation, namely, distance from the ground.

* 'The Mechanism of the Universe and its Primary Effort-exerting Powers. By Augustus Fendler.' Wilmington, Del.: Printed by the "Commercial Printing Company." 1874.

† We follow Professors Thomson and Tait in using "dynamics" in a wide sense, including Statics, in place of "mechanics," which, though commonly used in this sense, is more properly the theory of machines and mechanical constructions than that of the abstract principles of motion and equilibrium.

The word "force," unqualified, but understood to be limited to the meaning and descriptive measure of "accelerative force," or in a strictly-defined and technical meaning, is still commonly employed in treatises on dynamics. Otherwise it is always qualified, as in the "force of *inertia*." All its uses in mathematical language, or the equivalent terms, acceleration, mass, momentum, and energy, refer to precise, unambiguous definitions in the measures of the phenomena of motion, and do not refer to any other substantive or noumenal existence than the universal inductive fact that the phenomena of all actual movements in nature can be clearly and definitely or intelligently analyzed into phenomena and conditions of phenomena of which these terms denote the measures. In modern dynamics, the mathematical measures of actual phenomena are their real essences, as scientific facts. Even the much-derided Aristotelian doctrine in explanation of the various phenomena of suction—namely, "nature's abhorrence of a vacuum"—might pass muster in science (though not now as an ultimate principle) if a determination of *how much* nature's abhorrence amounts to under defined circumstances were attached to it. The real fault of the principle and its pretended explanations would be paralleled if we should seek to explain the movements of the planets and of falling bodies by "nature's abhorrence of divorce between bodies"—which is about what the word "attraction" meant to the lively imaginations of Newton's contemporaries, as with Huygens—without estimating, as the Newtonian law of gravity does, *how much* this abhorrence amounts to under given external relations. The fact that nature has an abhorrence of a vacuum *mathematically dependent on the weight of the liquid forced into it* is not impugned by the fact, subsequently discovered, that this weight is balanced by the weight and consequent pressure of the atmosphere, any more than Kepler's three descriptive and quantitative laws were invalidated by the subsequent deduction of them from the laws of motion and of gravity. Kepler's laws served, indeed, as the most effective inductive confirmations of these laws and their universality ; and Newton's law of gravity would still hold the honored place it has in science even if it should in future be shown to follow from independently-demonstrated and simpler, more ultimate conditions of changes in motion. Merely speculative explanations of it have no honor at all ; for its merits are in its being a precise quantitatively-descriptive law, and on this ground alone it holds its place in mathematical dynamics.

We have said that the word "force," when used without qualification, has come to mean unambiguously what, for the sake of avoiding ambiguity, Newton called *vis impressa;* so that in recent treatises the first law of motion is expressed in such terms as these : "A body under the action of no force, or of balanced forces, is either at rest or moves uniformly in a straight line." Newton's words were : "*Nisi quatenus a viribus impressis.*" Now, our author, apparently ignorant of the history of the science, and without any guidance from its mathematics, undertakes to criticise such a statement (Section VI.), simply on the ground that he has chosen, without giving any reasons for it, to give the unqualified word "force" a different meaning in what he is pleased to call an axiom (Axiom VIII., p. 12). He means by it the cause which keeps a body agoing when it moves. Of this cause modern dynamical science knows nothing, except the negative fact stated in the first law of motion, which may be given with even greater clearness without using the word "force" at all—namely, that, independently of properties through which a body is related to other bodies, or independently of such relations, its state of rest or of uniform motion in a fixed direction is unchanged. Behind this fact, except so far as it serves to define the word "force," or *vis impressa*, dynamic science does not go ; but it goes forward with this and other facts to most fruitful results in mathematical deductions, with which our author does not appear to be at all acquainted. Another fact, the second law of motion, which again may be fully expressed without the use of "force," is that the change in the component of a velocity in any direction may be measured in terms of a fixed property, namely, mass, and special outward relations, which in general are dependent simply on distances and directions.

Mathematical dynamics knows of no bodies at rest in any absolute sense. All the motions known or considered are relative motions—namely, continuous changes of distances between bodies, or between these and positions defined by other bodies. It is not known that even the centre or average position of all the masses of the universe is at rest in any absolute sense ; so that the absolute motion of no body is known, and the "force" of our author is without any definite measure or utility in mathematical dynamics. The principle of relative motion leaves all measures of motion considered as absolute quite out of the problems of this science, as indeed they are quite beyond our possible knowledge.

One of the principles of mathematical dynamics which staggers the unmathematical sciolist more than any other, and was at first one of the greatest difficulties, even with mathematicians, in the Newtonian theory of gravity—a difficulty repeatedly urged, and brought out from apparently independent meditations by anti-Newtonian heretics—is the doctrine of "action at a distance." This action, the metaphysicians say, is impossible, and they devote themselves to the invention of *media* through which force and motion may be communicated, or from which it may be collected (Axiom VII., p. 11), thinking that thereby they are helping out the mathematical genius of Newton by a profounder effort of thought than he was capable of. But with metaphysical action dynamical science has nothing to do. The action at a distance, considered in this science, is simply a change in motion measurably or mathematically dependent on (or a function of) distances from bodies, distances of which nothing is asserted but that they extend indefinitely beyond the masses or the visible and tangible limits of bodies. "A body cannot act where it is not"—"With all my heart," says Carlyle, "only where is it ?" If attractive force is an attribute of bodies (as it is whether or not this force depends on an intangible and invisible medium), then the presence of bodies at a distance from their visible limits must be assumed, so far at least as this attribute is concerned. The color of a body is familiarly known to be distinct from its solid extent, volume, or mass, and is not in the same place ; nevertheless, as superficial, is still contiguous with its other sensible qualities. The metaphysical difficulty of believing that the attribute of attraction may be still more displaced or removed than color, is a difficulty which disappears with its cause, namely, unfamiliarity with the conception. Patient study of mathematical and experimental science has resolved many such difficulties, which are not really logical ones ; for whether gravity will ever come in science to be a legitimately-derived attribute or property of bodies acting through a medium, or will for ever remain, as now, an ultimate phenomenal fact, there is nothing of contradiction or essential opposition to experience in its asserted action at a distance—at a distance, that is, not of course from where it acts, but from the places where other attributes of body are manifested ; that is, beyond its visible and tangible limits. Most theories of a gravitative medium have been in fact atomic, and, by the interposition of voids between atoms which is thus made, have really introduced the very action at a distance which the theories were devised to do away with. Indeed, the essential principle of action at a distance is a necessary consequence of the metaphysical axiom (which we are not, however, obliged by positive evidence to accept), that pure continuous matter is incompressible, as in the supposed atoms ; and though this action be only on a molecular scale, it is no more possible on this scale than on that larger one of gravitative action which mathematical dynamics is supposed to assume. But, as we have said, no such metaphysical assumption is made in this science.

No student of mathematics, competent to pass an examination in Newton's 'Principia,' not only on its definitions, axioms, and philosophical scholiums, but on its mathematical theorems and problems, could read with any profit, or even with any patience, Mr. Fendler's speculations. Those parts of the 'Principia,' or of more modern treatises, which such thinkers as our author appear to have studied, present themselves to the student who has clearly seen their embodiment in the mathematical deductions and experimental verifications of dynamical science in a wholly different light from that in which such speculative thinkers take them up. The laws or axioms and the definitions of this science are apparently considered by these thinkers as constituting in themselves a complete body of doctrine, capable of being studied and criticised quite independently of any other mathematics than what they directly involve, whereas they are really integrant parts or elements of a systematic deductive science ; and whether or not they are evident at a glance through familiar inductions, or by "intuitions *a priori*" (as some thinkers will have it), they have their truest proof in the broadest possible tests of experience, through the experimental and observational verifications of their mathematical consequences. Of the nature and force of this kind of proof none but students of mathematical dynamics and experimental physics can be supposed to have any adequate conception. To attempt to criticise the elementary conceptions and first principles of the science in any other way, and especially *a priori*, or with a simple reference to *Vernunft*, is really a display of the critic's incompetency, which is not remedied by a reference of his convictions to ancestral experience, or any other modification of the *a priori* doctrine, or any treatment of mathematical axioms as philosophical truths. Several modern writers, more distinguished than our author, and especially of late Mr. G. H. Lewes and Mr. H. Spencer, have thus illustrated how *a priori* too often means no more than *ab ignorantia et indolentia*. Such writers appear to think that the mathematical deductions of the science are of secondary importance from a philosophical point of view, or are merely illustrative applications of philosophical principles to the processes of nature. But instead of the

mathematical body of the science being an appendage to these principles as to an independent body of doctrines, these are themselves chosen and framed, so to speak, or determined in their forms and meanings with reference to the mathematics of a systematic deductive science.

*Miss Rovel.* Par Victor Cherbuliez. (New York: F. W. Christern; Boston: Estes & Lauriat [Translation.])—M. Victor Cherbuliez is probably unknown to that large number of readers to whom the mystic words "a French novel" suggest a production of the school of Emile Gaboriau or Ponson du Terrail; but if reputation is measured by quality rather than extent, few writers of the day stand so high. It is Shelley, we believe, who has been called the poet of poets; and in a similar fashion M. Cherbuliez may be called the novelist of literary people. He is prized by those readers who, while they have a due esteem for a telling intrigue, are inclined to assign a primary place to consummate literary art—to art which, if need be, is even a trifle obtrusive and self-conscious. For those readers the author of 'Miss Rovel' has been for the last fifteen years a very important personage, and the appearance of each of his half-dozen novels a literary event. The charm of his tales has been that they seemed written by a scholar who knew the world. The usual clever novel of commerce bears few traces of an intellect generally brilliant—an intellect which, in other fields than the flowery meads of fiction, has any rights that a critic is bound to respect. But M. Cherbuliez has always beaten the regular romancer on his own ground and has given us, into the bargain, a style which it was a pure intellectual luxury to encounter. He has exhibited an acuteness and finish of mind which made us feel that if he were not good-naturedly devoting himself to story-telling he might do great things in history and philosophy. M. Cherbuliez began, in fact, as we believe, with very solid studies, and laid the foundations of a thoroughly superior culture. His circumstances, too, were such as to give him a ballast of due weight; he was a Genevese, born and brought up among academic and literary traditions, and his first venture was a most ingenious essay on Greek æsthetics. If to these advantages he added the novelist's faculty—observation raised to the degree of a passion—and if imagination too was not wanting, a critic with half an eye might feel that here would be a prince of story-tellers. And, indeed, very much one of these charming potentates M. Cherbuliez has actually been. His dominion has been small and his reign has been brief; but Athens, under Pericles, was neither vast nor long-lived. It is a sad fact that the reign of M. Cherbuliez has come to an end by his own unwisdom; the united voice of his once loyal subjects pronounces his *déchéance*. We might make a long story, if we had space, of the history of our author's talent as revealed in his successive novels—of its transformations, its moods, its inflections, its lights and shades. It would be a story of varying hopes and fears on the part of those who watched him closely and judged him sympathetically. This might be represented, quite dramatically, as a visible contest between a good and evil principle, with victory tossing like a shuttlecock from one side to the other.

The evil principle with M. Cherbuliez has been simply—paradoxical as it sounds—that he was dangerously clever. The germ of decay in his talent might have been found in a little black spot which casually looked harmless enough, or rather seemed positively to set off the expression of his literary physiognomy, like the patches worn by ladies in the last century. We allude to an exaggerated relish for epigram. This had given us some alarm in the author's earlier novels, but we never expected to see it acquire such prodigious proportions as in this unfortunate 'Miss Rovel.' Of course it is not every one who can make epigrams by the hundred; one needs to be clever, and we have said that M. Cherbuliez is inordinately so. But one day he had a great misfortune: he went to Paris—whether in person or not hardly matters, but at any rate intellectually. He went there—judging on the apparent evidence—for the particular purpose of proving that a Genevese is not a provincial, and that if he gives his mind to it he may be as good a Parisian as the best. In this undertaking M. Cherbuliez has expended an incalculable number of epigrams, and, like all converts and late-comers to a faith, he has been fanatically, indefatigably devout. He has proved his point a hundred times over; if being Parisian means having a certain tone which one must be a Parisian to describe, though one may perhaps recognize and appreciate it on easier terms, M. Cherbuliez is superabundantly, overwhelmingly Parisian. We wish now he would unstring his bow a little, rest upon his laurels, send his imagination to pasture among the flower-strewn Alpine meadows whose influences are his birthright, and tell us another story with the easy, natural grace of his masterpiece, the 'Comte Kostia.' We call this work his masterpiece because it stands at the opposite end of the scale from 'Miss Rovel.' The latter is not a felicitous performance, and if we were not afraid of seeming to take the rubs of life unmanfully hard, we would say that we had passed some very dark hours in reading it. It offers, to speak frankly, the most striking example of the eclipse of a great talent that we have ever encountered, and we doubt whether, while still in the mid-season of life, a clever man has often fallen so far below himself. The author's cleverness is there; the story is smart, alert, effective at any cost; but it bears the same relation to the best of his former works as (to risk a trivial comparison) the intolerable stuff called bottled lemonade does to the agreeable compound it emulates. Miss Rovel, the author informs us, is a young English girl of eccentric antecedents, who, through a series of amazing escapades, ensnares the affections of a cynical but attractive French *savant*, by whom she is ultimately led to the altar. M. Cherbuliez assures us, we say, that his heroine is English; but in spite of his representations we insist on it that the language of Shakspere was unknown to her, and that she was born in the Paris boulevard, where she sprang up from some noxious literary seed dropped into a crack of the asphalt. But her nationality is of little consequence, for we venture to pronounce her a totally impossible young lady, and, what is worse, a very detestable one. We can forgive a fantastic heroine when she is pleasing, but we resent being launched in a balloon in the company of a damsel we dislike. Why cannot a French novelist draw, with any approach to verisimilitude, a young girl brought up in the Anglo-Saxon fashion? This question in itself would form the text of a disquisition, and we have only space to add that, as we should have said beforehand that M. Cherbuliez was the one writer of his craft in France capable of achieving the difficult feat we have mentioned, his signal failure is extremely disappointing. He has cruelly sacrificed his hero; for Miss Rovel was, in plain English, a very low-minded young woman.

---

*Prussia's Representative Man.* By Francis Lloyd (of the Universities of Halle and Athens) and William Newton, F.R.G.S. (London: Trübner. 1875.)—Not Bismarck, as the title of the book would naturally suggest, but Prussia's literary representative, Henrich von Kleist, the poet, is the subject of the volume in hand. It embraces a brief life of Kleist, an extended essay on the several schools in modern German literature, and translations of two of Kleist's works, 'Michael Kohlhaas: a Story,' and 'Prince Frederick of Homburg: a Drama.' The life is one of painful interest, a harrowing mingling of madness and genius. Heinrich von Kleist was born Oct. 10, 1776, in Frankfort. At an early age he entered the army, but was soon driven out of it by inward unrest and desire for study. The self-education he began was desultory, frantically vehement, indeed, in character, but without other result than to throw him into general ferment. The morbid element in his nature was too deep-seated to admit of his attaining self-mastery, and he wandered in increasing misery from land to land. Only late in life did it become clear to him that his true vocation was poetry. That there were great ideas seething in his mind all acknowledged who came in contact with him, yet he could for years work nothing into satisfactory shape. "Hell gave me my half-talent, Heaven dowers a man with a whole or none," was the self-confession wrung out of him by his despairing struggles. Still, even in those days, a man of the mark of Wieland could record after hearing him recite passages from a drama he was composing: "I do not think I am saying too much when I assure you that if the shades of Æschylus, Sophocles, and Shakspere were to combine to write a tragedy, the result would not surpass Kleist's 'Death of Guiskard the Norman'—that is, if the whole were equal to the part I heard." In a fit of despair he destroyed these fragments, while still possessed with the conviction that he would yet tear the wreath from Goethe's brow.

Kleist was a Brandenburger to the core. He hated the universalism that was leading Schiller and Goethe to be for ever looking to Greek, Italian, and English models, and trying to live themselves into bygone ages, from which nothing but bloodless shades could be brought back. In fact, the life of the present took too overmastering hold of him, racking his diseased sensitiveness to pieces and leaving him little or no calm for artistic creation. While Goethe sought to escape the distraction of thinking about his country's humiliation by burying himself in Oriental studies, Kleist raved himself out, at times like a madman, in poems full of the deification of hate and glorifying tyrannicide. So he continued, haunted and harried to the end, till falling in with a gifted woman, as life-weary as himself, and accepting her challenge that they should quit this miserable world and explore in company whether a better one could not be found elsewhere, he shot her through the heart and himself through the head.

Nevertheless, in his lucid periods, this man produced works that are landmarks in the history of German literature. He may fairly be called Prus-

sia's representative man. None other as he seized and gave expression to the essential spirit that has distinguished Prussia from other sections of Germany. In all the workings of his imagination, he was a soldier to the centre, blunt and often half-brutal in his speech, hating foreign ways in action and literature, and believing a Brandenburg oak to be worthier of a great singer than all the laurels of Parnassus. To him the rest of Germany was mongrel, half Teutonic, half French, or Italian in spirit, slavish, imitative, imbecile through irreconcilable ideas in policy, literature, religion. In a high sense he was a prophet of what recent history has made plain, that in the leadership of Prussia's Spartan discipline and iron will lay the sole salvation of the land. The same idea possessed him in respect of literature. All his life he was struggling to utter something in story, play, poem that would have the same kind of ring in it and unite spirit and form in the like style of a word and a blow. At times he succeeded in doing it.

The story of Michael Kohlhaas can hardly fail to strike by its terse straightforwardness. Though suffering in the translation for the rugged picturesqueness of Kleist's own words, still as the portrayal of a massive character, "at once the most right-feeling and the most ferocious man of his time," whose obstinate passion for justice made him a robber and a murderer, it will give the reader a terribly real character to think about. Kohlhaas is a plain horse-dealer, whose career dramatizes powerfully the wrongs and the savagery at the bottom of the peasant uprisings in the days of Martin Luther. 'The Prince of Homburg' is, however, the work in which Kleist's genius most triumphantly asserted itself. "It is the most ideal glorification of German military life the national literature possesses," yet in no general and declamatory way, but through the career of the hero of the piece. On the German stage it occupies a like position with Shakspere's Henry the Fourth on the English. From a reckless roysterer Prince Hal becomes a thoughtful man and the nation's idol. The Prince of Homburg is a hero from the start ; but he is the slave of his own unmastered imagination. His visions of love and glory enwrap him in a sublime selfishness. He has not yet grasped the tremendous import of subordination and obedience. At the council of war he fails, in his dreamy absorption, to note down his orders for the conduct of the approaching battle. In his impetuosity he sounds a general charge that brings about indeed, a decisive victory, in which the Prince covers himself with glory, but which defeats the Elector's plans for the annihilation of the Swedes. As a consequence, in the full flush of triumph the young hero finds himself arrested for military disobedience, is tried, and sentenced to death. Weakness overcomes him, and in his first misery he sues for life ; but when graver thoughts break in of the full bearing of his crime, he bows to the sentence and acknowledges its justice. Then first he is reprieved, as now first fit to live. From beginning to end, the play is alive with action, and we see a man fashioned to some purpose by real and impressive events.

The long introductory essay with which these pieces are prefaced will not interest the general reader. It contains good thoughts, but presented in a style wearisomely abstract and obscure.

---

*Antiquities of Long Island.* By Gabriel Furman. To which is added a Bibliography by Henry Onderdonk, jr. Edited by Frank Moore. (New York : J. W. Bouton. 1875.)—The contrast between the condition of New York and that of its suburbs must be, to a stranger at least, at once striking and perplexing. Abuse the government of the city as we very rightly always may, there is no denying that the expenditure of money both in private and public works has been such as to produce very imposing, if not beautiful, results. There are fine streets, there are enormous hotels, there are parks, there are boulevards, there are private houses, on which fabulous amounts of money have been spent. More than this, the tide shows no sign of turning. Notwithstanding the plunder—we may almost say sack—of the city by a horde of thieves, the public improvements are still going on, and the scale of private expenditure (expenditure, too, of a substantial kind) constantly increasing. But leave the island on which the city proper stands, and cross over to the New Jersey shore on one side, to Staten Island on the other, or to Long Island, and what sort of a process do we see going on there ? From the wealth of New York a stranger would naturally expect to find in the environs a long line of fine country-seats surrounding the city, in which the people whose "residential mansions" have been pointed out to him on Fifth Avenue have their suburban homes. He finds nothing of the sort. He finds, on the contrary, in the immediate neighborhood of the city, the ruins of a former generation of country-seats, surrounded and almost swallowed up by a swarm of shanties, lager-beer shops, bar-rooms, low hotels, and rows of untenanted houses put up in advance of population, which announce the proximity and the approach of the "metropolis" as distinctly as the sudden occupation of a quiet place by a number of citizens of the Hans Breitmann type would announce the approach of an invading army. If you enquire the history of the places against whose barriers this unpleasant new population is surging, you will probably learn that in the pre-railroad period some early owner of a familiar name had bought the property without an idea that in any calculable period of time the city would encroach upon the limits of his homestead, but supposed that the old place would descend in his family from father to son to the end of time—little suspecting that in fifty years the place would be worth as many millions as it then was thousands, that the river or the sea-beach at the foot of it would be river and sea-beach no longer, but would have become changed to "water-front," that the pleasant undulations of the ground would have become gravel-pits, or that to the latest descendants of the family in the year of grace 1875 what was to have been their home had become Real Estate. As the present generation simply intend to cut up their property and sell it in lots, they have, as sane men, no object in keeping it up, in fencing or making lawns or planting trees, and they therefore let it go out of repair ; upon which the sentimental stranger sighs, shakes his head, and turns his steps in some other direction, finding however, if he keeps within the immediate environs of the city, nothing but a repetition of the same thing—the same squalid shops and shanties, the same old, ill-kept places, the same general unkempt, out-at-elbows look, which is an equally good proof of the instability of human affairs and the "extraordinary progress of our city." Other places one also finds which were not originally homesteads but were bought not many years ago by some modern investor or speculator, who purchased a large piece of ground merely for the purpose of cutting it up into smaller pieces and selling at an advance, who has no interest in wasting money in making an impermanent country-seat out of "lots," and who is well satisfied with the condition of the property if assessments are not too heavy, if streets are laid out with regularity and at right angles, and the owners of any squalid hovels who may establish themselves on the premises can be made to pay a rent.

There is no part of the country in which this sort of progress, with its attendant decay, can be seen to better advantage than the western end of the island whose antiquities are so well preserved in the volume before us ; and we must say that our sympathy is profound for the industry of Mr. Furman, as well as his editor, Mr. Moore, who discovered the fragmentary manuscript in the shop of "a quaint and popular dealer in old books, pictures, and bric-à-brac on University Place." Long Island is almost the last place in the world where we should expect antiquarian studies to be flourishing, not for positive lack of material (if we do not insist on our antiquities being very old), but because the western end of the island is inseparably associated in our mind with that peculiar kind of social progress which we have just endeavored to describe, and which consists chiefly in a complete obliteration of everything which is old for the sake of what is new. An antiquarian on Long Island, if he is to survive in the struggle for existence with his hereditary foes, the speculator and the auctioneer, must be of very tough fibre.

If the reader, however, will lay aside all prepossessions and approach the subject in the true spirit, which, we take it, is that of mingled patriotism and microscopic curiosity, he will find that this part of Long Island is not destitute of interest. Without going back to the mythological period, there is some evidence to begin with of prehistoric remains (p. 94), while, according to Mr. Furman, as late as 1831 there was still a curious relic of the Indian occupation in the manufacture of wampum for the Indians of the West. Coming down to historical times, the island is one of the oldest settlements of the country, and at this day the different types of settlers—the Dutch at one end, and the New English Puritan at the other—may faintly suggest their primitive state. Even should the Dutch lose Holland, buildings of Dutch architecture will still be found standing on Long Island, to bear witness to the former extent of their power ; and the peculiar Dutch qualities of slowness, dogged obstinacy, and thrift will be preserved for a long while yet on farms of the island, where the Knickerbocker, in his undeveloped state of purveyor of early vegetables to the neighboring market, unspoiled as yet by visions of a "rise in real estate" or the necessity of founding a family, toils with his hired men among his potatoes and strawberries, wholly undisturbed by the movements of the world outside, reading little, but thinking profoundly, generally with the aid of tobacco, and speaking not oftener than is necessary. Some of the Dutch customs we have ourselves adopted—as in the case of the celebration of New Year's day and the institution of New Year's cake, which, unless we are mistaken, used to be given to the poor on New Year's day by way of charity, not fifty years ago, in Dutch towns by the "great people." Others, not peculiar to the Dutch, have passed

into disuse, as that mentioned by Mr. Furman (p. 161) of having a feast with plenty of cold meats, liquors, and tobacco on the occasion of a funeral, with the not uncommon accompaniment of a friendly chat and much consumption of liquor and tobacco under the trees among the farmers for two or three hours before the funeral began to move, and a great deal of noise "very inappropriate to the purpose for which they had assembled." These examples taken at random from the volume before us are hardly fair specimens of its contents. The curious in such matters will find in its pages a good many bits of local information of one kind and another, which are worth preserving as part of our somewhat meagre thread of history and tradition.

*Essays—Æsthetical.* By George H. Calvert. (Boston: Lee & Shepard. 1875.)—Mr. Calvert occasionally puts forth a modest volume of prose or verse which attracts no general attention, but which, we imagine, finds adequate appreciation among scattered readers. We prefer his prose to his verse, and we can frankly recommend this little collection of essays on subjects connected with art and letters. The author's fault, as a general thing, is in his vagueness, and in a tendency to judgments a trifle too ethereal and to a style considerably too florid. We prefer him, therefore, when he is treating of concrete rather than abstract matters, and we have found more edification in the volume before us in the papers on the translators of Dante, on Sainte-Beuve, and on Carlyle, than in the accompanying disquisitions on the Beautiful, on the Nature of Poetry, and on Style. To offer us off-hand, at the present hour, an article on the Beautiful, implies an almost heroic indifference to the tyranny of fashion. Mr. Calvert cares for letters for their own sake, he is a disinterested scholar, and his writing has the aroma of genuine culture. Even the occasional awkwardness and amateurishness of his manner are an indication of that union, so rare in this country, of taste and leisure which allows culture an opportunity to accumulate. The best thing in the volume is the article on Sainte-Beuve, in which the author shows that he had studied the great critic to very good purpose. It is very intelligent and, much of it, very felicitous, and it is filled, moreover, with excellent brief citations. But the best thing in it is the charming note from Sainte-Beuve which the author gives in an *addendum*, and of which we transcribe the greater part. Mr. Calvert had sent Sainte-Beuve the copy of the magazine in which the article originally appeared, but this miscarried, and the author sent a second copy. Whereupon Sainte-Beuve, writing December 6, 1868, six months before his death:

"Cher Monsieur:—Oh! cette fois je reçois bien décidément le très-aimable et très-étudié portrait du *critique*. Comment exprimer comme je le sens ma gratitude pour tant de soin, d'attention pénétrante, de désir d'être agréable tout en restant juste? Il y avait certes moyen d'insister bien plus sur les variations, les disparates et les défaillances momentanées de la pensée et du jugement à travers cette suite de volumes. C'est toujours un sujet d'étonnement pour moi, et cette fois autant que jamais, de voir comment un lecteur ami et un juge de goût parvient à tirer une figure une et consistante de ce qui ne me paraît à moi-même dans mon souvenir que le cours d'un long fleuve qui va s'épandant un peu au hasard des pentes et désertant continuellement ses rives. De tels portraits comme celui que vous voulez bien m'offrir me rendent un point d'appui et me feraient véritablement croire à moi-même. Et quand je songe à l'immense quantité d'esprits auxquels vous me présentez sous un aspect si favorable et si magistral dans ce nouveau monde si plein de jeunesse et d'avenir, je me prends d'une sorte de fierté et de courageuse confiance, comme en présence déjà de la postérité."

The reader will see that the art of saying things well did not desert the great critic, even in his moments of extreme relaxation. Every epistolary scrap from his hand that has come before us has quickened the impatience with which we await the promised publication of his correspondence. The perusal of the latter, if we are not mistaken, will be an extreme intellectual luxury. Mr. Calvert's volume further contains a reprinted paper, entitled "Errata"—an attempt to enumerate some of the common grammatical errors and literary vulgarisms of the day. The attempt is commendable, and the attack in some cases well-directed, but there is more than one expression that Mr. Calvert seems to us to condemn too trenchantly. "By no manner of means" is pronounced a "vulgar pleonasm." "By reason of" is called an "ugly, ill-assorted phrase." "I am free to confess" is declared "an irredeemable vulgarism," and "subject-matter" a "tautological humpback." We share Mr. Calvert's extreme enmity with regard to none of these phrases. Each of them, to our sense, will bear cross-examining. Of another—"to *ventilate*, applied to a subject or a person"—he affirms that "the scholar who uses this vilest of vulgarisms deserves to have his right thumb taken off." Here, surely, the author is quite wrong. A word is a vulgarism only when it is used without logical aptness. "To a person" we have never heard the word in question applied; but when applied to an idea, it has just that felicity, that harmonious analogy, which legitimates a figurative form of speech. In certain cases no other word would do so well. "Ventilate," also, if we are not mistaken, has respectable tradition in its favor, and can be found in sound English writers of the last century.

*Henry Holt & Co.'s*

EDUCATIONAL PUBLICATIONS.

*THE BOCHER-OTTO FRENCH* Course. (New edition of the Grammar, with full Vocabularies in preparation.)

*THE JOYNES-OTTO GERMAN* Course. (Recently adopted in Baltimore and Philadelphia, and already in use in numerous other cities.) To this course an Introductory German Reader has just been added.

*WHITNEY'S GERMAN COURSE.* The Text-Book of Yale and Harvard, and recommended by both to students preparing for college.

*FREEMAN'S HISTORICAL* Course. A Series of Historical Works for Schools on an entirely new plan.

*PYLODET'S FRENCH COURSE.* A Series of elementary and advanced works for the study of French. The elementary books are used in the California and Louisiana Public Schools; the higher works are text-books at Yale, Harvard, etc.

*TAINE'S ENGLISH LITERATURE.* The text-book of the best teachers.

*THE ORDO CLASSICS.* Introducing a new method of classical study.

*SIGLAR'S ENGLISH EXERCISES.* English Grammar taught by the use of Symbols.

*BAIN'S ENGLISH GRAMMAR.* A brief English Grammar on a logical plan.

Teachers who are thinking of changing text-books, are requested to send for a catalogue giving full description of these books.

No. 1 BOND ST., NEW YORK.

The most extensive and brilliant collection of rich

*BRIDAL GIFTS,*
*TESTIMONIAL PIECES,*
*FAMILY SILVER,*

etc., etc., to be found in the city, now offered at retail at the lowest possible prices.

The Gorham Stamp is an evidence of sterling purity and excellence alike to the purchaser and receiver.

*BUCKINGHAM HOTEL,*
FIFTH AVENUE, COR. FIFTIETH STREET,
(OPPOSITE THE CATHEDRAL.)

Will be completed by September next, and will be conducted on the European Plan, with special regard to the comfort of families.

New Improved Edition of

*Cassell's Family Magazine.*

It is a brilliant, interesting, and useful magazine, and contains only such matter as the wise parent may safely place in the hands of his family. Entertaining serial tales and short stories are interspersed with household information and useful receipts, the whole being elaborately and elegantly illustrated.

Subscription price, $3 50 per annum. Specimen numbers post free for 30 cents.

CASSELL, PETTER & GALPIN, 596 Broadway, N. Y.

ROBERT CLARKE & CO.,
CINCINNATI,
HAVE JUST PUBLISHED:

## Skinner's Source of Measures.

Being a Key to the Hebrew Egyptian Mystery in the Source of Measures originating the British Inch and the Ancient Cubit, by which was built the Great Pyramid of Egypt and the Temple of Solomon; and through the possession and use of which, man, assuming to realize the creative law of the Deity, set it forth in a mystery, among the Hebrews called "Kabbala." By J. Ralston Skinner. 8vo, pp. xvi.-324, cloth, price $5.
Sent by mail, prepaid, on receipt of price.

Will be ready 15th June.

## Ten Brook's American State Universities.

Their Origin and Progress; a History of Congressional University Land Grants; a particular account of the Rise and Development of the University of Michigan, and Hints toward the Future of the American University System. By Andrew Ten Brook, Librarian of the University of Michigan. 8vo, pp. viii.-408, cloth, $3 50.

Just Published.

## Ohio State Reports.

Vol. XXIV. Price $2 50.

The Ohio and Ohio State Reports are now all in print, and can be furnished—44 vols., law binding—at the extremely low price of $110.

THE CHEAPEST COMPLETE SET OF STATE REPORTS PUBLISHED.

"One peculiar feature of these Reports is that the syllabus or head-notes of each case is prepared by the judge assigned to deliver the opinion of the Court, and is submitted to the judges concurring therein for revisal before publication. . . . The result of all this is, that the head-notes present precisely the points decided by the Court, which they do not always do when prepared by the reporter. The Ohio State Reports have and deserve a high rank among the reports of the country. The Supreme Court is an able one, and the judges examine and discuss cases with great care and learning."—*Albany Law Journal.*

Teachers applying will be allowed a single copy of the book for examination on forwarding 75 cents to Hurd & Houghton, 13 Astor Place, New York; The Riverside Press, Cambridge, Mass.*

# The Nation.

*NEW YORK, THURSDAY, JUNE 10, 1875.*

## The Week.

THE wages of the laborers in the employment of this city were cut down last week from 25 cents an hour to 20 cents, or from $2 for a day of eight hours to $1 60; whereat the laborers were justly indignant, struck work, marched to the City Hall, and expressed their disappointment to General Porter and other officials, who made the excuse that the Board of Apportionment having reduced the appropriations, there was nothing for it but to discharge some of the men now at work, or reduce the rate of wages, so as to employ more. It will thus be seen that the theory of the relation of the taxpayers to the laborers they employ is not one of business, nor yet of charity, but something in the nature of a right to maintenance on the side of the laborers or a duty to maintain on the side of the taxpayers. This is acknowledged just as fully by giving more than the market rate of wages as by employing more men than are needed, and its full recognition has now come to be, as we have often pointed out, a prominent article in the creed of any party which tries to rule in this city. In fact, the municipal works are to all intents and purposes a reproduction of the French Ateliers Nationaux of 1848; and if they are not carried on as yet on so great a scale, it is because more avenues are as yet open to the energetic and enterprising in this country, or because the habit of dependence on the state has not yet got so fully hold of the working-classes here as in France. But the mere existence of such a system here of course operates, year after year, as a strong inducement to the shiftless, lazy, improvident, and incompetent in all parts of the country to come to New York, and they *are* coming steadily and increasingly. Once they get here, they become voters, and decide how much the bankers, and brokers, and shopkeepers, and mechanics ought to spend on drains, pavements, bridges, and other public works, or how many men they ought to employ, what should be the length of the working-day, and how hard a man should work for a given sum. The reason they are allowed to do this is that the nature of a municipal government requires it; and the answer to all objection to it is, "Let the substantial classes attend to their political duties, reason with the lazy and shiftless, and show them by the force of logic that they ought to do more work for less money." Governor Tilden's recognition in his late message of our suggestion that the taxpayers should be allowed to do a good deal of their own work under State superintendence, we take to be a sign that sensible men are beginning to open their eyes to the danger and folly of the present state of things.

---

The revelations made last week by Ingersoll, the Ring chairmaker, who was pardoned by Mr. Tilden for the sake of getting his evidence in the Ring suits, have furnished the officers of the State with the precise links in the chain of proof that were wanting, and have given the newspapers opportunity for a good deal of moralizing. The *Tribune*, for instance, says of James M. Sweeny, the brother and tool of Peter B. Sweeny, who has just died in Paris, that it is not at all improbable that the suits against the Ring were the cause of his death, and closes its reflections with this terrible picture of his latter end: "Banished from the only city of the world where he was likely to find congenial company, and sent by an ironical fate to the most refined and elegant capital of Europe, where no occupations would naturally present themselves to his uneducated mind except worrying and getting tipsy, it would be strange if he had long survived the wreck of his riotous confederacy, or could have faced with any sort of composure the impending loss of his ill-gotten money." The *World* puts the same thing in a more practical way by observing that what really stares these thieves in the face is beggary; they have no property, in all probability, except what they stole from the city, and with the attachment of that their means of support are taken away from them. It will not do, to be sure, to press this too far, for we understand that Peter B. Sweeny is still enjoying himself in Paris, while Connolly spends his winters on the Nile. Still, the machinery now possessed by the State for the prosecution of these claims is very complete, and enables suits to be maintained in foreign courts as well as in those of this country. The fate of Tweed and his gang, some of them in prison, others fugitives from justice, and some of them now threatened with starvation, is certainly an impressive subject for thought, and we trust that no thoughtful criminal in any branch of the public service, State or National, will overlook it.

---

Mr. W. M. Grosvenor, who is probably more conversant with the details of Missouri politics and the lives of Missouri politicians than almost any one in the State, has written a letter to the *Tribune* giving an account of the present condition of politics there. This letter shows plainly enough how necessary it will be for those who are desirous of a general political regeneration in 1876 to keep their skirts clear of entangling alliances with either party meanwhile. The independent voters in Missouri are beginning to think that they have tried the Democratic party as a Reform party sufficiently far, and their one desire in life is to get it out of power again. Mr. Grosvenor gives several reasons for this, among others the election of Cockrell, the inflationist Confederate general, to succeed Schurz in the Senate; but the upshot of them all is that, since the war, the management of both parties has been so rotten that the people who wish good government in the State have turned hopelessly to whichever of them was out of power for relief, only to find that on placing it within reach of temptation it became as bad as its rival. There seems to be little doubt that in Missouri and other Western States the idea of the Democrats as reformers, or of their leaders making demonstrations such as Tilden has made in this State, or Chamberlain in South Carolina, is utterly out of the question, and this also shows how much more evenly balanced the parties are throughout the country at large than most people suppose, and how much will depend in the next Presidential campaign on the character of the nominations on both sides.

---

In Ohio, where the Republicans have also reason to hope for a victory in consequence of Democratic mismanagement and corruption, the Republican platform adopted last Wednesday declares the unity of the nation and the equality of citizens before the laws; urges a non-committal policy of resumption, which will "ultimately equalize" the purchasing capacity of coin and paper; insists on a revenue tariff with incidental protection; declares against any division of the school-fund, and opposes all legislation in the interest of any particular sect; demands "such a revision of the Patent laws as will relieve industry from the oppression of monopolies"; promises gratitude as well as "liberality and generosity" to the soldiers and sailors; insists on the reservation of the public domain for actual settlers; applauds the determination of the Government to collect the revenue and punish frauds; demands a reduction of expenses, as well as of the power of municipal corporations to contract debts; insists on the observance of "Washington's example" as to a third term as part of the "unwritten law" of the Republic; and expresses gratitude to General Grant for the "distinguished success" of his Administration. There is no mistaking the meaning of the third-term resolution, which makes it evident that General Grant's letter came none too soon, nor of the local resolutions. What is said about the currency is unsatisfactory, and the tariff resolution means anything

you please. The policy of interference with the Southern States seems to have been forgotten, and the same thing may be said of the temperance question. The nomination of General Hayes for Governor is regarded as a strong one.

Mr. Charles Nordhoff's letters in the *Herald* throw some very valuable light on the condition of the Southern States. His account of Mississippi in particular is very interesting in more ways than one, inasmuch as in that State there is a colored majority combined with unmitigated rascality on both sides. The mass of the whites, he says, desire peace and quiet; but there is what the Congressional Committee called a wicked element, composed of the old bowie-knife and pistol men, whose bad language about "niggers" exerts, in Mr. Nordhoff's opinion, a most injurious influence on politics, in keeping the negroes massed together and making them afraid of the Democratic party. The Republican party contains a small faction, headed by Senator Ames, Butler's son-in-law, but it is as feeble in numbers as in character, though it has hitherto had the Administration at its back, and the Republicans of the best class have nothing to do with it. The "Ames Republicans," Mr. Nordhoff says, "have unscrupulously used the ignorance and greed of the negroes to help them in their political schemes." They put into such offices as county supervisor and treasurer, as well as into the legislature, negroes who were often "not only unable to read or write, but who were corrupt and corrupting demagogues," and he furnishes some shocking illustrations of negro incapacity and dishonesty. These things are worth notice in illustration of the fact, to which we have so often called attention, that good government at the South did not depend on Republicans being in a majority; that the white discontents were not by any means always the result of simple "cussedness" or "caste hatred."

The railroad war has forced itself on public attention during the week, and the utterances of Mr. Scott and Mr. Garrett, the original and main parties to the contest, have been read with the greatest interest by the holders of all kinds of railroad securities. Personal feeling is shown in the struggle between these rival chiefs in a way which proves that corporate interests are held in smaller account than they should be. In what Mr. Scott has had to say he has disguised this feeling better than has Mr. Garrett. The latter gentleman, if he has been correctly reported, indulges, when alluding to the personal bearings of the subject, in figures of speech; and, when speaking of the effect of the war on his company, shows refreshing assurance. He points to larger receipts than last year, but makes no mention of the increased mileage caused by the new road to Chicago. The inference would be that the lower the rates, the larger the receipts. He asserts that the trade of Baltimore has increased because of this war, whereas the statistics of the port show that it has fallen off; that his company offers no paper in New York, when the fact is that there is hardly a prominent bank here which has not been offered the paper by brokers, and when bankers in a position to know estimate that there are now nearly four millions held here. The actual cost of transporting a ton of freight one mile is about eight mills; it is known that the trunk-lines are taking through freight from competing points at less than that, it being asserted and uncontradicted that contracts have been made at a price less than three mills per mile. If this be so, it is easy to see what will be the result, provided the contest is long continued. Roads which have way-traffic enough to pay the losses on through business and their dividends and interest obligations, if there are any such roads, will survive, and the others will break down. For local business the New York Central stands first, the Pennsylvania and Erie come next, and the Baltimore and Ohio last. Strange as it may sound to those who have listened to the half-political balderdash about the Baltimore and Ohio solving the "problem of cheap transportation," this company charges higher local rates than any other of the trunk-lines. For transporting coal from Western Maryland, its rates at some points are so high as to be prohibitory, leaving the owners of the mines the option of selling their product to the Baltimore and Ohio at one dollar per ton or closing their mines. There is this, however, to be said in favor of the Baltimore and Ohio in this contest. It is free from watered stock, and its bonded debt, although largely increased within three years, is still smaller than the other lines. It has what is called a surplus of over $30,000,000; that is, this amount of surplus earnings has been withheld from the stockholders and invested in the stocks and bonds of connecting roads and in various kinds of railroad property. With railroads in a flourishing condition, part of this surplus would be equivalent to cash; with railroad property depressed, it would be wholly unavailable.

At the Stock Exchange the railroad war has overshadowed all other influences, and prices have advanced or declined as the advices have indicated its termination or continuance. Gold has advanced to 117¼, the specie shipments having amounted to $4,418,000, bringing the total export since January up to nearly $36,000,000, and carrying it above the total of any year since 1868. The shipments are to pay for 5-20 bonds coming here from Europe for redemption under the call of the Treasury. The trade demand for exchange on London is small, and the supply of exchange is also small; early in the week, a large amount of grain was bought for export, but grain makes little exchange, and the export movement had not fairly begun before speculators started prices up, so that even this small source for bills was dried up. The foreign-trade figures show dulness, the total exports, excepting specie, having been $4,268,000, or about $1,000,000 below last year, and the imports $6,004,607, or more than $2,000,000 less than last year. Domestic trade also continues dull; the spring business has closed with but one satisfactory feature, and that is the general prudence exhibited in granting credits. What the autumn trade will be depends very much on the growing crops. At present the indications are favorable both for cotton and grain. Even with the low price of cotton during the past year, the manufacturers of cotton goods have been "doing poorly." The Atlantic Mills, of Lawrence, Mass., which employ 1,250 operatives and turn out 450,000 yards per week, have closed until September. With the general dulness, it is not strange that money is abundant. Legal-tender notes continue to pile up in the New York banks, which hold now nearly $65,000,000, or more than has been held since last September, about $3,500,000 more than last year, and $20,000,000 more than in 1873, before the panic.

The Indian chiefs have left Washington, and will soon return to the Black Hills and report to their people the result of their interview with the Great Father and his two great chiefs, as he calls them, Smith and Delano. Politically and economically, their visit to Washington may come to something, but morally it cannot be said to have been a success. The Indians on the whole must have been impressed chiefly with the desire of the two great chiefs and their Great Father to get hold of their land, and their suspicions of foul dealing were probably not allayed by the fact that about the time of their arrival in Washington there was an "exposure" of one of the great chiefs, and it was generally announced by the newspapers that he was to retire from office on account of corrupt practices. Then the interpreters seem to have modified everything they interpreted, so that each interview was generally half occupied with corrections of the misstatements or lies contained in the official record of the one just preceding it. The Indians, however, are apparently shrewd at a bargain, and showed that they had caught the spirit of the place, one of the chiefs hinting to Delano that he could easily understand from his own experience with his people at home how the white chief felt about the newspapers; and Red Cloud, on the Administration's suggesting that it desired his photograph, declining to let it be taken unless the Government should "put up" twenty-five dollars. They were assured on all sides that the Great Father wished to do everything that was just and kind, but they have evidently heard this before. The trouble with them

is that they do not understand the value of the great discovery of modern politics, viz., that you must infer the probable acts of a person from his own description to you of his motives. If you infer his motives from his acts, you spoil the whole game.

The Baltimore *Katholische Volks-Zeitung*, a German newspaper published under the sanction of the Archbishop and other ecclesiastical authorities, recently, by way of showing up the iniquity of the Falk Laws, gave its readers a glimpse of court-life in Berlin for which we trust the editor is doing heavy penance. He says that "unbelievers" in all states are the most immoral, dishonorable, shameless, filthy, and depraved persons, and declares that "the most terrible immorality and frightfully vicious life have assumed shocking dimensions among non-Catholic people." Of this the pious rascal gives the following horrid examples: In Berlin there are 150,000 depraved women, many of whom assail passers-by in broad daylight in a state of nature, and, if a policeman interfered, he would be murdered. The Crown Princess, Queen Victoria's daughter, has no more faith than a horse, was an intimate friend of the infidel Strauss, and gave a masked ball not long ago at which drunken military officers appeared as monks and nuns, and "indulged in offensive, immoral gestures and movements." The Princess's character is notoriously bad, and she has many illegitimate children, while her husband has at least thirty; in fact, all the officers of the guard are illegitimate sons of high personages, and there is a special department in the Cabinet whose duty it is to provide names and coats-of-arms for this class of the population. The morals of the local bodies are no better, and, in fact, the rest of the exposures of these German Protestants are so grossly indecent that they will not bear reproduction in any form. Now, we should greatly like to know what Archbishop Bayley and Bishop Wood, who allow themselves to be advertised as patrons of this journal, think of the foregoing account of Prussian manners, and what they think of a religious paper which feeds the faithful in this manner. Their fellow-citizens have a right to know whether it really goes into Catholic families with the stamp of their approval.

It is so short a time since the Russian Government began to let the world know anything about its finances that the study of them has still the charm of novelty, and the steady rise in its credit is among the remarkable financial phenomena of the day. The last loan for railroad purposes—that is, the last issue of railroad bonds with a Government guarantee at 4½ per cent. interest—brought 92 on the London markets. The previous issue now sells at 102 to 105. But the history of Russian revenue and expenditure since 1852, when the publication of the budget began, is curious and significant. The naval and military expenditure has just doubled in that period, while the sum devoted to education has only increased one-third. The public debt is just three times what it was in 1852, and the public revenue and expenditure are not double what they were. The exports of all kinds—though they consist almost entirely of raw products—have quadrupled. Russia's principal trade is with Germany, which now has become a steady customer for her grain, and, on the other hand, sends her now fully one-half her imports. It may interest the Western Granger to know that England is about the furthest market eastward that he can hereafter hope to reach with his cereals on his trans-continental double-track, steel railroad, because although Russia has only about a quarter of a mile of railroad, to the geographical square mile, to the three miles of the United States, her production of corn is increasing so rapidly that she has already secured the German market for her cereals, and will probably not be dislodged from it except by the opening of the valley of the Danube by additional railroads; and will probably stand ready to supply any other country of the European continent which, like Germany, ceases to produce food enough for its wants, at rates which no robbery of bondholders will enable the Western farmer to compete with. Nearly half of her exports last year was in grain, one-eighth was in flax, one-eighteenth in hemp, and about as much in lumber.

The latest French financial statement from M. Léon Say is, however, a far more remarkable tale than any other nation has to tell. The war has added in round numbers $155,000,000 to the annual charges of the Government, and in this we make no allowance for the increase of burden caused by the loss of Alsace and Lorraine. Nevertheless, if we leave out of account the annual repayments of $40,000,000 to the Bank of France, the Government has had a surplus every year since 1871, and $130,000,000 of new taxes have been laid on. The indirect taxes alone yielded in 1874 over $370,000,000, or more than the whole annual revenue of Great Britain, equal to that of the United States; and this was an increase of about $10,000,000 over 1873. M. Léon Say estimates his surplus next year at $30,000,000, which the London *Economist* does not think by any means over-sanguine, and he therefore proposes to impose no new additional burdens on the country, and even sees a not very remote prospect of beginning to reduce the debt or the taxes, or both. But he announces his intention of postponing the resumption of specie payments until January 1, 1878, on the ground that the plan of taking time to prepare is a good one, as is shown by the example of England in 1819 and of the United States to-day. But then he must not suppose that the delay here was resolved on by Congress as part of a carefully weighed financial scheme. Congress fixed on 1879 as the year for our resumption simply because the period is far enough off to give nobody any concern, and therefore to take the financial question out of the political arena; and then we have a discount on paper to be got rid of, as the English had in 1819, while the French issues are at par. His other reason is, that if he resumed specie payments the Bank of France would have to withdraw the convertible notes which it was allowed to issue during the war as part of the consideration of the loan it made to the Government at the low rate of one per cent., and therefore the Government ought, in common fairness, to repay the loan in full, which it is not now able to do, before ordering resumption in coin.

We are far from defending, or even apologizing, for the view said to be taken by the military party in Germany as to the course which it would be advisable for the Empire to adopt toward France; but, in judging of the morality of it, it is well to remember that it does not originate with the Germans. The French did precisely this accursed thing in 1870—that is, attacked Germany in order to crush her, not because she had inflicted any injury on France, but because she appeared to be growing stronger than Frenchmen liked; and the fact that Louis Napoleon did not do this at an earlier period was treated by the Opposition as the cardinal error of his career. Moreover, M. Thiers preached again and again in the Assembly the duty of discouraging and, where practicable, preventing the formation of strong states around France. So that if the Junker party were to attack France to-day, in order to overwhelm her before she had completed her military organization, they would be only following French precedents. This would not excuse or palliate the offence; but it does make some of the French horror over the ferocity of the German *hobereaux* somewhat unbecoming.

The Prussian bishops have published a reply to the rescript of the Government of the 9th of April, in which they maintain that the Falk Laws contain a whole series of provisions which conflict with the existence and constitution of the church; deny that obedience to such laws is rendered by the Catholic clergy in any country; but affirm that, touching many of these provisions, an amicable understanding with the Government might be reached; declare that, as regards the submission of the bishops to the Vatican Decrees, they had no alternative—to ask to disobey them is to ask them to abandon the Catholic faith—and that the Decrees have furnished no adequate excuse for the Government legislation. They try to prove this by citing the example of other Catholic countries in which, except the Grand-Duchy of Baden and some cantons of Switzerland, no trouble has occurred in consequence of them. The only thing noteworthy in the reply is the evidence it contains, however slight it may be, that the bishops would be glad to compromise.

## LOUISIANA AND NEW HAMPSHIRE.

WE publish on another page a letter from a New Hampshire correspondent who invites us to consider the striking similarity between the present election case in New Hampshire and the Louisiana case of last winter, and who says that he has been looking from week to week to see us "deal with Governor Weston and his Council in the same unsparing manner" in which we have dealt with lawless officials in the Southern States. We should have no hesitation in "dealing with" him, and his Council too, did the case warrant such severe measures; but the muddle into which the politicians have got themselves in New Hampshire has all along seemed to us at once too technical and too much like other election cases which arise from time to time in the Northern States, and too likely also to come up for judicial decision in the courts, to make it worth while for us to "deal with" anybody about it, except with some of the more partisan newspapers, which were making a tremendous clamor over a case which they certainly did not understand any too thoroughly. In speaking of the case last week, we expressly declined to give any opinion on the merits, and merely said that if the Secretary of State's view of the law was correct, there would seem to be nothing to say in reply to his letter; and this we say again. It seems, however, that the Republican rejoinder to this defence is that the Secretary is not correct in his view of the law; that the Governor and Council, though they may "examine" the votes, are not a judicial body; that the moderators of the towns are the officials who have, short of the legislature, all the authority over elections; and that after the moderator has made his decision, and the town-clerk has recorded his "declaration," nobody can take external evidence to determine who was really elected but the two houses of the legislature, each of which is, as everybody admits, the final judge of the elections, returns, and qualifications of its own members.

The undisputed facts in the New Hampshire case are these: At the last election there was no choice for Governor, and the election was in this way thrown into the hands of the legislature. That body is, however, closely divided, and the change of a very small number of seats would give one party or the other the coveted power of electing the Governor. The Governor and Council are, in the case of the Senate, the returning board, who receive from the town-clerks the result of the voting, "examine" this result, and send the names of those who appear to be elected to the clerk of the Senate, and the list thus made out furnishes the roll of the Senate as it first stands. There are two disputed cases, but that of "Natt" Head is the more important one. The law undoubtedly required the moderators to throw out all the votes cast for "Natt" Head, because his full name was Nathaniel. In that case the election would have been carried by Priest, and to Priest the Governor and Council have given it. Of course, if they had no right to go into the question at all, they have done wrong, and deserve to be blamed for it. If they had any judicial authority, then the limits of that authority should be determined by the courts in a peaceful and orderly manner, and that is exactly what, as we write, is now being done.

It will be seen that there are, as our correspondent points out, certain resemblances between the New Hampshire and the Louisiana cases. In both there have been elections of the State legislature, and in both the result has placed each party so nearly even with the other that the change of a few votes would give the practical control of the State to either of them. In each case the election returns were sent by the local election officers to the central returning board, and by them "examined."

Here, however, the resemblance completely ends, while the differences which the subsequent proceedings reveal are so glaring that, far from seeing in the present condition of New Hampshire politics a repetition of the Louisiana case, we should select it as a very good illustration of the normal working of republican institutions. But in order that there may be no doubt about the matter, we will state the various proceedings which the New Hampshire politicians should have taken to make the cases parallel, and promise that if any such a series of events takes place there, or in any other State, we will denounce the people who are responsible for it unsparingly. In the first place, the Democratic Governor and Council of New Hampshire, if they had meant to follow the Louisiana precedent, would not have wasted their time and labor in correcting the mistakes made at the polls in such trifling matters as the counting of votes which were legally blanks, and after all have left it an open question whether the Democrats or the Republicans had carried the day; they would have got quietly together in a room, where they would have gone over the returns until they had found out exactly how many seats in the Senate were needed by their party, after which they would have taken up the returns on which Democrats were declared elected, and passed them, reserving the Republican cases till the end; then, taking the Republicans whom they found declared elected, but whom it was necessary to unseat, they would have proceeded to examine into the circumstances of their election, and to certify thereupon that owing to conclusive evidence of "fraud" or "corruption" at the polls, these seats were vacant. They or their political friends would at the same time have applied to Washington for troops on the ground of expectation of bloodshed and domestic violence, which the President would, of course, have been obliged to grant. They would then have proceeded to organize the legislature, and on an attempt being made by that body to organize itself, the troops would have come in and organized it for them, by driving out a number of them at the point of the bayonet. The general in command would have issued his proclamation denouncing the chief Republicans of the State as banditti, and telegraphed to Washington for permission to court-martial and execute them. The "Natt" Head question would then have been referred to the President, to whom the general in command would probably have telegraphed that, if "Natt's" votes were not counted, violence and anarchy would rule the State; the President would have referred the "Natt" Head question to Congress; Congress would have had an investigating committee about it; this committee would have divided into two parts, and one would have taken one side of the question, one another, and the "Natt" Head case would have become a great national question, which could only have been settled by a sort of international treaty drawn up as between sovereign powers, and signed by people who had no more authority in the premises under the Constitution and the laws than the Khedive or the Guikwar of Baroda.

We do not say that all this will not happen in New Hampshire, but we do not believe that it will, for the simple reason that it is an American State, governed by American customs and laws, and in the habit of settling its political questions in the American manner, by legal means, and not by external force. The indignation of some of the Republican papers over the New Hampshire affair furnishes very good reading for the moralist who has managed to keep himself in happy ignorance of recent political history. But those who are familiar with the events of the last twenty years, and have any habits of reflection, can hardly help wondering, not that such things should be, but that they have not happened oftener. This particular kind of unscrupulousness or illegality with which the New Hampshire Democrats are charged, is emphatically one which can only be extirpated by the resolute determination of one political party, at least, to refrain from and discountenance it. It may be said to have been begun by the Democrats in the latter days of the anti-slavery conflict, and it is a sort of device which the peculiar composition of that party makes very attractive. In other words, the moral tone of a large body of the members is not very high, while their interest in politics is very keen. The discouragement and reprobation of such practices ought, therefore, to have been a leading feature in Republican policy, and this discouragement and reprobation ought to have been displayed in practice, as well as on the stump and in editorial articles. To resort to it either in retaliation or for the promotion of high aims was a tolerably sure way to give it a permanent lodgment in American political practice; and this the Republicans, as soon as they came out of the war, unhappily did

not hesitate to do at the South. The Force Bills, to say nothing of the electioneering carried on under the superintendence of the Attorney-General, were simply Republican declarations that wherever they had the game in their own hands they meant to play it in their own way. We are, therefore, very glad for our part that the New Hampshire incident has occurred soon enough after the Louisiana affair to bring home to the minds of Republican statesmen the fact that the little arts they have been practising at the South are capable of being closely imitated by their Democratic fellow-citizens, and that there is no way under heaven of giving the good and pure a monopoly of fraud and violence.

## STRIKES AND SPECULATION.

THE failure of the Aberdare Iron Company in England, which is acknowledged to have been hastened or precipitated by strikes, is worth attention as an illustration of the way in which the condition of the labor market, not in England only, but in other commercial countries, contributes to the growth of the spirit of speculation, over which there is just now so much lamentation. The Stock Exchange in this country has long been a favorite object of denunciation to indignant moralists; and there are a good many pious people in various parts of the country who fancy that its abolition by law should form the first step in any attempt to purify the national morals. The London Exchange for a good while preserved a better character, but of late it, too, has fallen into disgrace. The history of some of the recent operations on it is anything but edifying reading. In fact, some of its members have felt obliged to write letters to the papers justifying its existence, in consequence of the recent disclosures as to the mode in which foreign government loans are put on the London market. But no exposures or denunciations lessen the importance of the Stock Exchange, or retard the steady growth of the dealings in stocks of one sort or another, or tend to make them less attractive to the general public, or to diminish the amount of capital which is used in holding them for a rise or fall. It must be observed, too, that the spirit of speculation is not confined to stocks; it extends to all commodities—cotton, grain, tea, coffee, sugar, and in fact to everything which is largely dealt in, and the supply of which is affected by contingencies of one sort or another. The pulpit, the newspapers, and all the better sort of popular writers, are unwearied in their praises of slow gains, the gradual accumulation of wealth by fidelity and assiduity, and of the dangers of over-eagerness to be rich; but steady industry, nevertheless, does not grow in popular estimation as much as one could wish. The credit of the slow-going, faithful man does not grow in proportion to that of the skilful operator. The boys do not like to serve long apprenticeships; the young men do not like to work their way up in obscure or out-of-the-way places, where fortune has no surprises in store. Everybody wants to get to the large cities, where there is a chance of a "quick turn" and of getting a fortune before one grows old. People like to have their diamonds and champagne while they are young, and find they can have a great deal of enjoyment without "the respect of all who know them."

Now, whatever increases the uncertainties of regular business enterprises, and whatever makes the results of ordinary industry seem doubtful, unquestionably fosters the speculative fever. The ease with which small men can now borrow money, and thus increase competition, has greatly reduced already the number of great mercantile houses, and will probably prevent the founding of any more like those in whose hands the banking and foreign trade of England and this country lay at the beginning of the present century. Nobody can go to India or China in our day and be sure of a fortune by mere steadiness. No merchant can despatch well-assorted cargoes to various parts of the world, and then wait patiently until the ships come back, with the certainty of making money, if they escape shipwreck and pirates. The despatch of goods to a foreign port is but the beginning of anxiety, because their value changes every hour until their arrival. The submarine cables, too, have ruined the brokers who had made a reputation for sagacity and foresight, by enabling every small speculator to flash his offers of commodities at any distance direct to the buyer, without the intervention of the broker, and to "cut under" the broker.

The discontent of the laboring class is having a similar effect on those branches of industry which require large investments of capital and make slow returns, such as iron-making, spinning, and mining. They make it a little more difficult to estimate cost, and a little more doubtful what the result will be of any undertaking requiring a long period for its execution. For instance, the immense ship-building establishments which a few years ago flourished on the Thames have been driven away to the Clyde, owing to the impossibility of making estimates of work to be done by London workmen. A strike means a change of greater or less amount in the cost of production then pending. In the case of contracts adjusted as nicely as contracts have to be in the present state of competition, even a slight change may sometimes work ruin. The anxiety of a contest with workmen under such circumstances, especially on a falling market, can hardly be imagined by an outsider. It would not be easy to overestimate the amount of it which must have preceded a catastrophe so great as the failure of the Aberdare Company; and this anxiety produces its effect on the bystanders, especially on the young men. When they see the ruin of their seniors wrought, not by extravagance or unskilfulness or want of judgment, but by what they consider the crankiness or folly of laborers, they either turn their faces away from fields in which toil does not bring its due reward and which do not yield the excitement of gambling, or they determine to do business in some quicker and slighter way, which, by bringing in returns more rapidly, will lighten risks. This is the secret of much of the imperfect work of our day. It is imperfect because, to make sure of the profits, it has to be done quickly.

The extent to which public and private morals rest on certainty as to the future exceeds all ordinary conception. Neither civilization nor character can be said to begin to grow until people can look forward for a few years, and conclude with confidence that if they do a certain thing for a certain length of time, assured results will follow. Uncertainty is always barbarizing, and indeed may be said to constitute the essence of barbarism. The most striking feature in savage life is the general distrust about the next day, or even the next hour; the most striking feature in civilized life is the general confidence that things will happen in a certain prearranged sequence. All legislation, or social disorders, whether strikes, riots, or wars, which diminish this confidence, sap the foundations of morality in a greater or less degree—it may be only slightly, but still surely. It is in this way that cheating by governments, like the Potter Law in Wisconsin, helps to foster the gambling tendency in human nature and make steady devotion to laborious callings distasteful; and it is on this tendency that the enormous system of modern "stock operations" rests. A like effect is produced by lawlessness such as that which prevails in the Pennsylvania coal regions, in many parts of the South, and in the South American states. This accounts, too, for the success of many despotisms; if they do nothing else, they preserve order, which means, on the moral side, confidence in the future; and when you give a man this, you enable him, if not to make the most of himself, to make a great deal.

## THE BOOK-KEEPING OF RELIGIOUS PUBLICATION SOCIETIES.

IN theory a religious publication society is the organized production and distribution, by sale or gift, of books, periodicals, and tracts inculcating such forms of belief as are held by the persons constituting and maintaining the organization. Most commonly it is directly connected with some particular religious body, but in some cases represents a union of various bodies having a common interest in the conduct of the society. When fully equipped, it procures MSS., manufactures them in appropriate forms, sells them through the book-trade or over its own counter or by special agents, and also makes gifts of them where it finds a sale inexpedient or impossible. For carrying on this enterprise it relies on the sales of its publications and on contributions in money, solicited through paid agents

or associate organizations ; it establishes a printing-office and bindery, an engraver's shop, a book-store with branch offices ; it employs secretaries, editors, and other salaried officers, and has its newspaper organ in which to call attention to its work and its publications. Sermons are preached in its interest, public meetings held, and a considerable amount of machinery set in motion to keep it in active operation. Those who contribute to its funds do so on the ground that thereby religious truth, of a more or less special character, is disseminated. The appeal to them is made on this ground ; this is the sole object in their mind ; and they regard the society as a delegated agent to do in an organized way what as individuals they themselves cannot do. Moreover, by their relation to the society, they are predisposed to buy their religious literature mainly, if not exclusively, of them.

This, we say, is the theory of a religious publication society. Practically, it is a publishing concern, differing from other publishing houses not only in having a large body of interested patrons, but in being substantially removed from the ordinary perils of business. It is able in an exigency to rely upon reserve funds, which are not lent but given outright for the support of the concern, and the possibility of failure is almost entirely left out of account, not because the business is impregnably established upon sound business principles, but because it is insured against loss by daily deposits which are never called for by the depositors. Or, to put the case in a still clearer light, the society as a publishing house may at any time avail itself of the trust funds which it holds as a trustee of charitable money, and in doing this have all the appearance of transacting a legitimate business, and of using the trust funds exactly as the donors intended. If, as is customary, the books of the charitable department and the books of the publishing department are kept separate, it is perfectly easy, so long as public confidence in the society continues, to make each set of books show a balance on the right side.

Let us illustrate this point by one or two examples. A manuscript is offered for publication and accepted by the committee. The author is paid a certain sum in full for all claims, the manuscript is stereotyped, the book printed and bound, and offered for sale. But, as may happen even to an irreligious book, it fails to find buyers enough to take more than half the edition. The society finds itself with the remaining half on its hands as dead stock. An ordinary publisher, after trying all ordinary means of disposal, can only send the books to the mill to be ground, the stereotype plates to the foundry to be melted, credit his venture with a good deal less than the cost of the paper he bought to print the books on, and so many pounds of type-metal at a few cents a pound, where he has paid perhaps a dollar a pound for stereotyping, and charge the net result to profit and loss. But the society need never come to such a pass. As a business house, it can sell the unsalable books to itself as a charitable association, at any price from retail to wholesale that it judges expedient, credit the business with the sale, give away the books through its agents, and charge the charitable department with the cost of the books and the cost of distribution. In this case the business balance-sheet shows a profit, and the charitable sheet is properly charged with a legitimate grant of religious reading.

Another example will illustrate the same point. The society issues a paper at a subscription price which cannot cover the cost of production unless a very large edition is circulated. As one means of increasing the circulation, it adopts a plan much in vogue amongst newspaper publishers, and issues a large extra edition of a single number, sending the sheets to a multitude of addresses, and urging the persons receiving this specimen number to examine it and be induced to subscribe for the year. It is to be expected that a certain percentage of the people receiving these specimens will subscribe ; they have been advertised of the paper by this means. Now, the society need not charge the expense of this extra edition to the publication of the paper. It discovers that it sent the specimens out for the purpose of distributing religious literature freely, and so it charges the cost of the paper and the cost of distribution, including postage, to the charitable department. Upon the business-books the transaction appears as the sale of a large edition of the paper, passed to its credit ; upon the charitable books, as the grant of religious papers, including expense of distribution—a very proper and legitimate charge upon the society in this function. We add one further illustration drawn from the management of periodicals. The strong competition which exists among the several societies in the publication of papers requires that the price laid upon them should be in some cases less than cost ; to repair this damage, it is only necessary to charge the charitable department, which is a large purchaser, at a higher rate than the subscribers are charged. In brief, when the business part of the concern fails to make a good investment, it can dispose of its unsalable goods to a customer, the charitable department, which stands ready to take them at any time at something above the highest market rate ; when the business wishes to secure extensive advertising, to increase the volume of its sales, it can by a simple device get its advertising done for nothing, and make a handsome sale to the advertiser at the same time ; when the business finds itself hard pressed in competition, it finds a generous backer in the charitable department, which has the satisfaction of doing good to the world at large and its own brother in particular by a single stroke.

The competition with kindred societies suggests the relation which any one of these societies holds toward the book-trade in general. A correspondent of the *Publishers' Weekly* some time since entered a complaint against the religious publication societies that they were in the habit of making special discounts to Sunday-schools, thereby preventing the retail dealer from keeping the only customers whom he could expect for the class of books in question. To this the editor replied : "The chief difficulty in this matter comes of the complication of the religious publishing societies with the general trade. These publication houses, so far as they are charitable and missionary in organization, do not come within trade lines, and cannot be expected to look at matters of price from the trade point of view." We should suspect the editor of irony if we did not know that this double character of the houses in question had confused the heads even of those who managed them. The relation which the societies hold to the general book-trade is a part of our subject which calls for separate and special treatment ; we content ourselves here with pointing out a single instance in which regular laws are interfered with by the action of the religious publication society. It issues a great many books for young people, with special reference to the Sunday-school libraries. There are other publishers engaged in the enterprise of publishing the same class of books, and building up their business indeed upon this foundation. These books must be cheap ; but in order that any single copy of a book may be cheap, it is necessary that a large edition of the book should be issued and sold. Here comes in the superior advantage of the religious publication society. It may double or treble the size of the edition which an ordinary publisher would think it prudent to issue of the same book, and thus reduce the divided cost, and consequently the retail price of each copy. It can, therefore, submit its books to schools or single buyers at a uniformly lower rate than individual publishers can afford, compelling the latter to cheapen the books they offer in order to compete with their more favorably placed rivals.

It is thus seen that such a society has an immense advantage by the side of an ordinary publishing house. It can publish freely, pay salaries, issue neat annual reports overflowing with testimony to the value of the publications, but somewhat reserved in the statement of accounts, hold public meetings, and go on its way rejoicing, while an ordinary publishing house with the same list of publications would very probably be enjoying a day of judgment long before its day of jubilee came. It may be said that the very object of these societies and the condition under which they work give them a natural advantage ; that they are not business houses constituted for earning money, but associations for disbursing money in the form of books or other publications, and that the criticism which we have offered at the most only affects their mode of adjusting accounts ; that it is for the interest of the public which they represent to maintain the societies, even at a loss, for the express purpose of keeping in circulation the literature which they produce and distribute. We are not inveighing against the organized production and distribution of religious literature, we are considering only the method of the organization ; and it is just because of the nature of its work that we regard criticism of its methods imperative.

Every religious publication society is a trustee. It holds funds committed to it for a single purpose. No one consciously contributes money for the purpose of keeping a complicated machinery of publication in operation ; the funds are given to supply people with a special class of literature ; and it is assumed that the trustees, or the society, understands how to use this money prudently, so that as little as possible shall be expended upon the agency. How do the trustees invest these funds ? Originally they put them into a business—the business of publishing and selling books—which is notoriously uncertain, requiring the closest possible attention, the most scrupulous economy in management ; a business quick to feel any general depression in the country, and open to the sharpest competition. No publishing house in the country could maintain itself that was conducted, as to its selection of books, by an irresponsible committee, and as to the manufacture and sale of them, by salaried officers who had nothing at stake beyond a position not likely to be taken from them unless they were grossly inefficient. It must be remembered that a religious publishing society, when fully equipped, is not a mere bookselling house, but it is a manufacturing house as well, and undertakes to carry on the complicated business of printing and binding, in fair weather and foul, with all the risks that attend this kin of manufacturing. No printing office, it is safe to say, could be

profitably carried on long without the stimulus which personal interest on the part of its proprietor supplied. The profit of the business is in its saving, and he saves whose living depends on his saving. Originally, we said, the trustees put the trust money into this business; when fully under way, the donations which come in and the legacies left to the society are ostensibly devoted to the distribution of the literature furnished by the society, and great pains is taken to assert this fact, but we have shown above by how simple a process the charitable receipts are made to cover a deficiency in the business receipts, while they figure upon the books as exclusively used for the purpose intended by the donors. We have analyzed the reports of several of these societies, and the same conclusion is reached in all. It is unfortunate, however, for a clear understanding that the published exhibits are very brief as a rule, and the whole system of book-keeping employed so complex that only an expert could be expected to discover wherein a society had failed in the faithful execution of the trust.

We are not writing in any spirit of enmity toward the societies; we simply criticise the methods employed, and we offer what seems to us a simple and intelligible solution of the problem involved in the management of a religious publication society. That people will desire to make use of agencies for propagating the belief they hold we grant, and we also contend that they have a right to demand the utmost possible simplicity and directness, the least possible opportunity for mismanagement, and the most open exhibit of accounts. The first and final step to be taken is for the society to dissolve completely the partnership between charity and trade. It was not instituted to make and sell books which people are eager to buy, but to provide books which it regards as so good for people that they must be persuaded to take them as a gift in most cases. It is absolutely impossible in the nature of things for such a society to be self-supporting as a business house, and it has no moral right to put forward such a pretension, when it knows that collapse would follow a general withdrawal of funds entrusted to it.

Now, supposing the society to have a suitable manuscript in hand, it may judiciously determine that it is expedient to have it stereotyped, but there is no necessity for setting up a composing-room and stereotype foundry for this purpose; there are enough such offices eager for the work, and stereotype plates may be made at the lowest market rates. Thus far the society takes upon itself no extraordinary risks, and is about its legitimate business. If the book has elements of popularity, a publisher can easily be found who will take on himself the risk of paper, printing, binding, and selling, paying a royalty to the society for the use of the plates, and thus the society will get back something on its investment, while it shares the interest of the publisher in securing a general sale of the book. Moreover, it can buy as many copies as it sees fit, at cost, for free distribution. Again, supposing the society desirous of distributing books and tracts which nobody will buy at any price, still its most economical method is not to engage in the risky business of manufacturing, but to order its goods made by manufacturers constantly engaged in such work; by so doing, it does not lock up its capital in presses and type, which it must keep constantly busy or suffer loss. By this simple process the society rids itself of the risks and cumbrous machinery of publication; it reduces current expenses by having no bookstore nor a large body of clerks; free from the embarrassments of business, it is enabled to use the money entrusted to it for the legitimate purpose designed. It can move slowly or quickly in the matter of publishing, according as the funds come in for the purpose. It is not obliged, as other publishing houses are, to keep publishing whether times are dull or not. It can make a full and perfectly intelligible exhibit of its finances; and, above all, the whole proceeding will be upon a ground of honesty and not subject to the severe strains which we have pointed out above. We are not proposing an untried scheme. Historical publication societies at home and abroad have adopted the plan, and at least one English and two American religious publishing societies are to-day organized upon this general basis. We are convinced that sooner or later every religious publication society in the country must pass through the ordeal of an investigation of its affairs, to determine whether or not its entire method is false and misleading.

## ENGLAND.—MR. GRANT DUFF'S POLITICAL SURVEY.

LONDON, May 22, 1875.

THE town of Elgin, in the northeast of Scotland, is the very last place in the United Kingdom in which you would expect to find a political reservoir filled to the brim with liberal wisdom, and overflowing into the streets and byways of less favored cities from its superabundance of interesting, uncommon, and instructive information. Elgin is an unobtrusive little town, surrounded by corn-fields telling from the heaviness of their crops of patient husbandry and superior farming. It is separated from the Northern Ocean by three or four miles of bleak arable land and benty sand-hills peopled with rabbits. It is inhabited by a gentle but unprogressive population, one-half old maids, the other half pensioned officials and retired shopkeepers. There are no manufactories and no trade to speak of. It is not a garrison town. There are no educational institutions of any note, there is no professional life—not even a hydropathic establishment or anything of the kind—to give a zest to existence or a stimulus to intellectual or material development. There is no reason why Elgin should have any place in the universe except one—and that is, that, conjointly with three or four other towns worse than itself, it returns Mr. Grant Duff to Parliament as its representative.

Mr. Grant Duff is comparatively a young man. He was born, as it appears from Dod's 'Parliamentary Companion,' in 1829, in the North of Scotland. He was educated at Edinburgh and at Balliol College, Oxford—the educational dry nurse of all distinguished Scotchmen and not a few distinguished Englishmen. He entered Parliament, as representative for the Elgin district of burghs, in 1857, and was Under-Secretary of State for India during the late Gladstone Administration. He was also Lord Rector of Aberdeen University from 1866 to 1872. Such is the dry record of his life, accurate enough, because Dod is always accurate, but, to those who have watched his Parliamentary career more closely than Dod, supremely inadequate. It is not too much to say that the member for the Elgin burghs has, during the eighteen years of his Parliamentary life, proved himself, perhaps without exception, the most assiduous statesman in the House of Commons. I use the word "statesman" advisedly. There are many more assiduous politicians, bustling about the lobbies of the House and the reception-rooms of the leaders of their party, moving heaven and earth to win an election here or catch a vote there, or hamper a political opponent for the good not of the commonwealth but of their own particular faction in it. Mr. Grant Duff has eschewed any claims to statesmanship which may be gained by such means as these. He has rested his title to political influence on the hard work of political study, pursued not in England only, but over the whole range of political life. He never rests. In season and out of season, he is always working, flying about from one source of political instruction to another, and laying up stores of wisdom and information, and anecdote to help the wisdom and information down; and all his rich hive of political honey which he has thus diligently piled up, he lavishes once a year upon his Elgin constituents. So that out of this unlikely locality there comes an extra Parliamentary address every year which finds its way into prominent places in leading newspapers both at home and abroad, and is more canvassed and criticised and discussed in society and by the press than nine-tenths of the leading speeches which are delivered within the walls of the two Houses of Parliament.

There is something curious in the manner of this annual manifesto. A very old story is extant of a Presbyterian divine, the incumbent of two barren rocks in the Frith of Clyde, with a scanty population of some hundred souls, who, in offering up a prayer for the prosperity of the rocks in question, was wont to beseech the Almighty at the same time and in his great mercy not to overlook the adjacent islands of Great Britain and Ireland. So it is with Mr. Grant Duff. He preaches nominally to the town of Elgin, but in reality his words are addressed not to it, nor even to the adjacent islands of Great Britain and Ireland, but to the whole Eastern hemisphere. Nor does he stay his course even there. At times, indeed, he seems almost to annihilate space. His eye glances across the sea, and in its survey takes in the more prominent institutions and the newest combinations in your country and in Southern America. And all these institutions and combinations, both of the Old World and of the New, he passes in review before his bewildered constituents in Elgin for their political amelioration.

And even stronger heads than those of his northern electors might feel dizzy at the contemplation of the mass of men and things which Mr. Grant Duff brings before them. He takes his constituents, as a London daily newspaper profanely but appositely puts it, up an exceeding high mountain apart, and shows them all the kingdoms of the earth in a moment of time. I have a collection of his addresses before me which was published in 1868, and is called a "Political Survey." It is dedicated to his constituents, and given to them in the form of a book and not on the platform, as he had intended. "These addresses were begun," he says, "with a view to their being delivered to audiences in the Elgin district of burghs. The necessity, however, of making a large number of speeches on our internal politics during the month preceding the recent election, and other circumstances, having prevented my actually delivering them, I now offer them to you through the press." The brain whirls and the sight grows dim as you

read the contents of this book. It commences with Europe, and surveys the internal politics of France, Italy, Spain, Portugal, Holland, Germany, Austria, Russia, and all the minor states. Part II. treats with equal minuteness of Asiatic Turkey, Persia, Central Asia, China, and two or three less familiar states, and then takes up another continent, and lays bare before the eyes of Elgin the true condition of the West Coast of Africa, of Madagascar, of Abyssinia and Zanzibar, and two or three more African empires. Parts III. and IV. are devoted to the Western Hemisphere and the United States ; Mexico, Central America, and Hayti being dealt with in Part III., and Columbia, Venezuela, Brazil, and a host more of the states of South America, in Part IV. All this, including a Review and Conclusion, is compressed into some 240 moderately-sized pages of largish print. And the information given is not such as a man picks up out of encyclopædias, or abbreviated histories, or the tales of special correspondents to the daily papers. It is mostly new, and relating to events which have just happened, or are likely to happen, in the respective countries. The view, no doubt, of the political situations is such as a man would see of the material situations from a balloon floating gently over the universe. But the events forming the subjects of this bird's-eye view are grouped together with intelligence and skill, and, though the summary is bewildering, it is always original and interesting. Some people like being bewildered by an original and interesting man, and it is only reasonable to suppose that this is the case with the electors of Elgin, otherwise they would not have stood by their present member for eighteen years.

The address which he delivered the day before yesterday was less bewildering and not less interesting than usual. He has visited, as he explained to his audience, every country in Europe except Portugal, and studied all their institutions—his system being not to take anything at second-hand, but to visit a country first and read about it afterwards. On the present occasion he had reversed the process. He had studied India as an intelligent politician through the dark glass of official life, when he was Under-Secretary for India in the Gladstone Administration. But now that the Gladstone Administration had come to an end and his official services were no longer wanted, he took advantage of the opportunity to acquaint himself with the true character of the great empire he had been governing at home. He went out to India last November, and spent some months in the country, seeing with his own eyes what he had only read in despatches, and mastering with his great ability and assiduity the details of the government of the empire. He has just returned to England, taking Italy, France, and Germany on his way, and he has paid his constituents the high compliment of an early visit. His personal doings when in India are being recorded from month to month in the *Contemporary Review*, and most interesting and suggestive records they are, and well worthy of perusal. The opinions which he formed on this his pilgrimage, or at least the most important of them, both with regard to India and to the present state of Europe, he has just given us in this address to the burghers of Elgin in the first instance, and to the world in the second.

I do not mean to give you even a summary of these opinions, as doubtless you will have them in full before this reaches you. They are all colored with the optimist views of the universe which Mr. Grant Duff, in contradistinction to Mr. Rathbone Greg, will always take of contemporary affairs. Mr. Greg, in his Cassandra vein, sees nothing but tribulation coming upon the earth. Mr. Grant Duff, on the other hand, sees good in everything—even in household suffrage. There is no Conservative reaction at home, he says, only the exhaustion and dulness incident to the great labors of the Administration of which he was a distinguished member. The front Opposition bench is the "least factious of Oppositions," just as it was "the most laborious of governments." The British army is, thanks to Lord Cardwell's reform, as good and large as it ever was in time of peace ; the British navy, thanks to Mr. Childers, is even finer. The Indian Empire is a grander possession than he had imagined before he saw it, and our hold over it is firmer. The native army is efficient. The Indian civilians under the competitive system are as healthy and gentlemanly, and more intelligent than they were under the nominative system. France is recovering her strength, and her people their spirits. Everything looks bright on the horizon. There may be a little speck in one corner produced by the military spirit in Germany, but that will probably pass away. And if the usual bad luck attends the financial policy of the Tory Government at home, it will only have the effect of bringing back the Liberals to power sooner than might have been anticipated. Whatever opinion any one may form of the truth of Mr. Grant Duff's political speculations, no one can call him a croaker or deny him the credit of laborious and enlightened toil and intelligent criticism. He stands by himself in the House of Commons and in this country. It has been said of him that omniscience is his forte and omnipresence is his foible, and it is on these two rocks that he may shipwreck his Parliamentary career. I cannot believe it will be so ; he has too much good sense and too good judgment to run such a risk. I have ever read with the greatest possible interest all that he has said or written, and I confidently expect to see him, before many years are over, one of the leading politicians in the country. In the meantime, why should he be cavilled at for using the agency of the Elgin burghs for the promulgation of his opinions ? It would be hard indeed if the world were to be prevented from reaping the benefit from his labors and experience—if he were to give up to Elgin what was obviously meant for mankind.

## THE FRENCH VIEW OF THE LATE WAR-CLOUD.

PARIS, May 21, 1875.

DURING a storm at night a flash of lightning suddenly illuminates the whole landscape, and for a moment everything becomes visible. Panics have a little the same effect in politics : they give us a sudden vision of things, and when they are ended everything lapses again into the dark. We have had during the last month a war panic. Nobody thought or dreamt of war, when suddenly everybody began to talk of it. How did this happen ? To say that it all arose from some newspaper articles in Germany, in France, and in England would perhaps exaggerate the importance of this fourth power in the state—the press. The articles in the *Post* (I mean the German *Post*) or the *Deutsche Allgemeine Zeitung* are formidable because we see in them, or think that we see in them, the thoughts of the German Chancellor ; the letters of "our own correspondent" or "our French correspondent" in the *Times* agitate the Exchange because they are sometimes attributed to the Duke Decazes, sometimes to Count Beust, sometimes to the English Government.

The situation which was revealed to the general public in Europe by the press was well known to those who keep their eyes open on the state of the world. I am a constant reader of the German newspapers, and I have long known that since the peace of Frankfort was signed there has been a double current of thought in Germany. The military party was not completely satisfied with this peace ; but its voice was stifled at first in the satisfaction of the German people. By degrees, it became apparent that the resources of France were far larger than had been imagined ; our prosperity, after so many misfortunes, has become a commonplace subject of conversation. People do not reflect that we have *not* paid our ransom in reality ; we have given five milliards to the Germans, but we have borrowed them in order to liberate our territory, and we are paying yearly the interest on this enormous sum in the form of increased taxes. It is true that the French people are wonderfully industrious and economical ; we are increasing our capital every year ; the ancient habits of the people have accumulated capital to such an extent that we have been able practically to resume specie payment. Our legislation is such that our speculators have not been allowed to plunge headlong into the system of indiscriminate railway-building. Our six great companies of railway lines are prosperous; our peasants have invested all their savings in the French rentes, and have brought them up above par, four years after the war. In an economical point of view, the situation of France is therefore better than that of any country in Europe, especially if you reflect that our Government has made no perpetual concession of the railroads, and that, sooner or later, the ten milliards now invested in the railways will return to the state, and thus diminish our debt by half, without the necessity of a sinking fund. This situation has excited the jealousy of Germany ; the five milliards which we paid to them excited an unnatural development of enterprise, and much money has been hopelessly lost in Germany since the war. It seemed to many observers that the conquerors had lost by their victory and the vanquished gained by their defeat. This, of course, is a superficial view of things, as the German state has become much richer by paying a large part of its debt, while many individuals may have suffered by bad speculations. The wealth of the state and the wealth of individuals are two things somewhat independent, if not sometimes contrary to each other.

In a military point of view, the advantage was altogether on the German side. It is one of the characteristics of the military leaders of Germany to consider war as a great experiment ; they seem to think of nothing but finding defects in their own army. After Sadowa, the German Emperor spoke of nothing but the faults which had been found with his artillery. So it was after the campaign in France : the artillery had to be changed, the Chassepot must find a better match in the *Mauser*, the mobilization must be made even quicker than it had been before Woerth and Forbach, the forts round Strasbourg must be constructed according to new and improved principles. In France, it is very different. The siege proved

that the existing forts of Paris are completely insufficient, and cannot preserve the finest city in the world from a bombardment; but the new forts are only planned; one or two only are begun. Our army was in utter disorganization: a small nucleus was reorganized during the Commune, and since that time great efforts have been made. But we have had no great Minister of War; you hear nothing but complaints if you talk to military men. We had no longer any artillery: owing to the energy of a young colonel, we are now provided with a provisional artillery, but it is merely provisional, and the field-gun of the future is not even begun. Among our commanders of *corps d'armée*, a few have placed their corps in a very good state of training. The majority are old and discouraged, and have no initiative. There is a continual struggle between the *bureaux*, the officers of the War Department, and the generals in command. Our cavalry has very few horses; we have no horses for our artillery and our transports. Our commissariat has not yet been fully reorganized. Our territorial army, the equivalent of the Landwehr, exists only on paper; it has not yet received even a beginning of organization.

It is idle to talk, in view of such facts, of the active preparations of France. The German press makes much noise over our new law of *cadres;* but what are *cadres* without men? and the number of men we can dispose of has not been altered. The military preparations of France have been so slow, so imperfect, as to have been the object of constant criticism in all military circles. But what shall we say of the German preparation? Who can deny that Alsace is full of troops; that all the men of the reserve have been called out, under pretence of trying the new *Mauser* gun; that supplementary rations a short time ago were given to all the horses, to put them in training; that specific instructions were given to all the majors in the Alsatian villages to inform them of their duties in time of war? The officers, *horresco referens*, were already allowed to let their beards grow. Who can deny that on the other side of the Empire great preparations have been long making in the Duchy of Posen, that much railway material has been accumulated on the frontier of Russia?—Germany's force must be felt on all sides.

There is no indiscretion now in saying that to very good and well-informed judges war appeared imminent a little while ago. But these same judges always knew that Germany would not go to war without the consent of Russia and an arrangement with Austria. The new alliance of the three emperors must be preserved. But was there no way to obtain from them a permission in blank? Two arguments could be used with the Russian Emperor—what I may call the argument of humanity, and the argument of a republic. You could say to a humanitarian sovereign: The French are bent on having their revenge; if we wait long, the war will be very sanguinary, it will cover Europe with ruins and victims; let us finish this business while the task is easy, and secure a long peace by a short and almost pacific campaign. You could say to him also: The Republic is not what people thought; France does not tear herself with her own hands; the Republic is becoming respectable, and has a chance of establishing itself in the centre of Europe. Does this suit you? Will you have a Republic of millionaires and noblemen, a decent Republic, become a focus of liberty and equality through all Europe?

The arguments with the Austrian Emperor were different. He had been forced out of the German Confederation; but now that Prussia had accomplished her task, she could not but remember that there were large German communities in Germany. Could not the Emperor of Austria come back and take his place in the great German unity—not, of course, as the representative of this unity, but as a brother of the German Emperor, as a friend, like the King of Bavaria or the King of Saxony? The first place, of course, would be given to him after the Hohenzollern; Austria would derive great advantage from the unification of the laws, of the military armaments, of the tariffs. She would bring with her, as vassals of Germany, all the Slavonic population of the Danube. These offers have not been made so brutally; but the Emperor of Austria knows well that the attraction of great Germany is imperilling his own tenure of power; half his empire has, so to speak, ceased to belong to him, or has at any rate a divided allegiance. He has always been unfortunate, he often fears that he may be ultimately driven from Vienna to Pesth. He is not in a position to refuse much to his powerful neighbors; he remembers Villafranca and Sadowa.

The alliance of the three Emperors, which took place in 1872, is the great feature of the political condition of Europe. Nobody knows exactly what its terms were, and perhaps many things were left in the dark. But the alliance specified that the great questions which might arise in Europe should be examined together, and, if possible, solved together. This was already tieing Austria, to a certain extent, to the policy of Germany, as the relations of Russia and Prussia were then and are still of the most cordial character. In point of fact, the moral right of *veto* belongs to the Emperor Alexander more than to the Emperor Francis Joseph, because Alexander feels himself the master of an empire which Prussia cannot devour, which can suffer great military defeats and still exist, while Austria may lose its own separate existence in new complications, return to the atomic state, and become the prey of Germany and of Russia. So long as this situation lasts, and we do not see how it may be altered, the peace of the world will depend upon the good-will of two or three men, who keep their own counsel, who have nothing to fear from parliamentary government or public opinion. We used to speak in the times of Napoleon III. of the "solitary will" of the Tuileries which ruled the world. The solitary will is no longer in the Tuileries; but, in all our pride of civilization and progress, we cannot deny the fact that the uncontrolled will of a few "solitary wills" can precipitate nations against each other at any moment.

For the present the fear of war seems to have been useless. We are all quiet again, the clouds have gone, the tempest did not begin. But is there no cause of uneasiness in the mere fact that the attention of all the world was centred for a day on the meeting at Berlin? The oracles have said "peace," but the oracles might have said war. The two Emperors as usual dressed in many uniforms and drank each other's health, but they also drank the health of their respective armies. A new meeting will soon take place of the three allied Emperors. The general impression is that no complications are to be feared this season, and we are beginning to consider a deferred danger as a gain. The question of disarmament may be discussed between the three Emperors, but this question resembles that of capital punishment. "Messieurs les assassins, commencez les premiers," said Alphonse Karr when he discussed the abolition of the death penalty. Who will disarm first? Then comes the religious question, which is likely to continue to agitate the whole of Europe. Great researches on the Conclaves are made in the archives of all countries. The King of Italy has tried to find if any of the states of which he may consider himself as the heir had any particular privilege in the Conclave. The Emperor of Austria has a right of veto; and who knows if the German Emperor will not try to use it through Austria? France has her archives full of documents on this interesting question; but she is not in a position which allows her to take the lead in any great movement. We must remain quiet, look on, remember, and learn. It was said of the old *émigrés*, "Ils n'ont rien appris ni rien oublié." There are things which we cannot forget, but there are many which we have to learn.

# Correspondence.

## THE NEW HAMPSHIRE DISPUTE.

To the Editor of The Nation:

Sir: I have read with interest and hearty assent much that has appeared in your columns denunciatory of the lawlessness of officials in the Southern States, and, supposing that the principles suited to the latitude of New Orleans were applicable also in New Hampshire, I have looked from week to week to see you deal with Gov. Weston and his Council in the same unsparing manner.

As I glanced hastily through "The Week" in your issue of May 27, I thought that my waiting was at last rewarded. What was my surprise when I found that you had reached the conclusion that "no desperate injustice had been done," and this upon the strength of statements made by our Democratic Secretary of State. Turning to Mr. Butterfield's communication, I find it good in many respects as far as it goes, but shortcoming is its great defect.

No exception is taken to the statement of the returns. But the citations in support of the Executive action are faulty in this, that they have no bearing upon the question at issue. Take that one relating to preparation of the ballot: "The full Christian and sirname of every person voted for, with the initial letter, etc., etc., shall be written or printed upon every ballot, and every ballot not thus prepared shall be regarded as a blank, and shall not be counted." The history of the law—the important element in determining its interpretation, you will admit—shows that the law was intended to describe the duties of the moderator of the town-meeting. The town-clerk records his declaration of the result of the voting, and sends a copy to the Secretary of State. He in turn lays these returns before the Governor and Council, who are to "examine the returned copies of such records and issue summons to such as appear to be chosen." What is meant by "examine"? Not, as Mr. Butterfield claims, the investigation that the Senate might properly institute as to "the elections, returns, and qualifications of its own members," but simply a footing up of the

votes with a view to summon members elect to their duties. The invariable usage of the Executive for eighty years shows this. An illustration in point is the case of E. D. Sanborn of Dartmouth College. It was discovered after his election that he was ineligible, like Mr. Deering in the Fourth District. But though he was a Democrat, a Republican Governor and Council issued a summons to him, rightly deciding that they could not go back of the returns before them. And it is remarkable that our present State authorities think that this does well enough in some cases, for they have issued a certificate of election to Congress to Frank (formerly Franklin) Jones, though denying the right of Natt (formerly Nathaniel) Head to be voted for at all.

The courts too, when appealed to, have always sustained the view that there was no going back of the returns except by the legislative body having cognizance of them, as may be seen in the case of Bell *vs.* Pike, contestants for a certificate of election to Congress in 1873. Here it should be said that the Republicans only asked that the cases under consideration be referred to the court reconstituted by the Democrats last year, which reference was steadily resisted by their opponents and by a paltry trick avoided.

The "uproar" then, as you are pleased to term it, is raised because Gov. Weston and his associates, exceeding their own functions, have arrogated to themselves the duties of the moderators of the town-meetings, and have also set up to be "judges of elections, returns, and qualifications of members of the Senate"—a dangerous departure from the letter and spirit of our laws.

Your Concord correspondent, after all his labored argumentation, seems to be conscious that his party associates have made a rather novel application of the provisions cited, for he says, in a paragraph near the close of his letter, "The men now declared elected were the choice of the people of the districts, but were placed in a minority at the polls through frauds, and they saw no other way of securing their rights except through a resort to this method." Is there not in these words an admission that the *method* is unprecedented?

The fact is that Gov. Weston has apparently been forced, by the most unscrupulous of Bourbon leaders to be found in any State in the Union, to resort to one of those "tricks of interpretation" which you have of late so justly condemned. To ward off, if possible, defeat and exposure, which they have richly merited, they have attempted to arouse "the sleeping giant of our Constitution." Unless signs deceive, they have awakened a feeling of indignation and contempt they had not counted on.

I am, yours respectfully,

C. L. Hubbard.

Reed's Ferry, N. H., June 1, 1875.

## PROFESSOR ADAMS'S ORIGINALITY ASSAILED.

To the Editor of The Nation:

Sir: Allow me to call your attention to certain coincidences in Professor C. K. Adams's work on 'Democracy and Monarchy in France' which seem to me to need explanation. On page 41, *sqq.*, Mr. Adams remarks:

"The work ['De l'Esprit' of Helvetius] sustains the same relations to ethics that atheism does to the Christian religion. The author sets out with the declaration that the difference between man and other animals is simply the difference in their external form; that if Nature, instead of giving us hands and flexible joints, had terminated our limbs with hoofs like those of a horse, we should have remained wanderers on the earth, chiefly anxious to find our needful supply of food and to protect ourselves against the attacks of wild beasts [here the original passage is quoted in a foot-note]. That the structure of our bodies is thus the sole cause of our superiority over the beasts, he argues from the fundamental doctrine that our thoughts are simply the product of two faculties which we have in common with the beasts, namely, the faculty of receiving impressions from external objects, and the faculty of remembering those impressions. . . . To take any other view is to allow ourselves to be deceived by conventional expressions and by the prejudices of ignorant men . . . our notions of virtue and duty must be tested by reference to our senses; in other words, by the gross amount of physical enjoyment which they afford. . . . Cousin has well expressed the fact in saying, 'Le siècle de Louis XV. se reconnut dans l'ouvrage d'Helvétius' ('Hist. de la Philos.,' I. Série, vol. iii. p. 201) [foot-note]. . . . Surin, though a zealous opponent of Helvetius, declares that 'strangers the most eminent for their dignity and their culture desire to be introduced to a philosopher whose name is spoken in all parts of Europe.' Brissot, who wrote twenty years and more after the publication of 'De l'Esprit,' says that the system of Helvetius was in the greatest vogue ('Mémoires,' vol. i. p. 339). Turgot refers to it as a system that was praised 'with a kind of fury' ('Œuvres,' vol. ix. p. 297); and Georgel declares that the book was to be found on every table ('ce livre se trouvait sur toutes les tables') ('Mémoires,' vol. ii. p. 256). . . . Madame Dudeffant, a person who represented the intelligence of her epoch, could say with truth, 'The success of the book of Helvetius is not surprising: he is the man who has told the secret of everybody.'"

Buckle says (vol. i. p. 789, *sqq.*, ed. 1857, London):

"In this work ['De l'Esprit' of Helvetius] principles are laid down which bear exactly the same relation to ethics that atheism bears to theology. Helvétius, at the beginning of his enquiry, assumes that the difference between man and other animals is the result of a difference in their external form; and that if, for example, our wrists, instead of ending with hands and flexible fingers, had merely ended like a horse's foot, we should always have remained wanderers on the face of the earth . . . having no other concern but to avoid the attacks of wild beasts and find the needful supply of our daily food [here the original passage is quoted in a foot-note]. That the structure of our bodies is the sole cause of our boasted superiority becomes evident when we consider that our thoughts are simply the product of two faculties which we have in common with all other animals, the faculty of receiving impressions from external objects, and the faculty of remembering these impressions when received. . . . To take any other view is to allow ourselves to be deceived by conventional expressions which have no foundation except in the prejudices of ignorant men. . . . all notions of duty and of virtue must be tested by their relations to the senses: in other words, by the gross amount of physical enjoyment to which they give rise. . . . le siècle de Louis XV. se reconnut dans l'ouvrage d'Helvétius (Cousin, 'Hist. de la Philos.,' I. Série, vol. iii. p. 201). . . . Madame Dudeffant, who passed her long life in the midst of French society, and was one of the keenest observers of her time, has expressed this with great happiness. The work of Helvétius, she says, is popular, since he is the man who has told everybody their own secret. . . . Saint Surin, a zealous opponent of Helvétius, admits that 'les étrangers les plus éminents par leurs dignités ou par leurs lumières désiraient d'être introduits chez un philosophe dont le nom retentissait dans toute l'Europe.' . . . Brissot ('Mémoires,' vol. i. p. 339) says that in 1775 'le système d'Helvétius avait alors la plus grand vogue.' Turgot, who wrote against it, complains that it was praised 'avec une sorte de fureur' ('Œuvres de Turgot,' vol. ix. p. 297); and Georgel ('Mémoires,' vol. ii. p. 256) says: 'Ce livre, écrit avec un style plein de chaleur et d'images, se trouvait sur toutes les toilettes.'"

Mr. Adams concludes his sketch of Helvetius by saying that "these references might be reinforced by others drawn from the various branches of French literature, but it is unnecessary." Buckle gives one or two others. After disposing of Helvetius Mr. Adams makes up his notice of Condorcet in precisely the same manner. From his examination of philosophical theories, Buckle proceeds to consider the influence these exercised on the spread of physical science. Mr. Adams does the same, but he mentions not a name nor a fact that is not contained in Buckle. Every one of his anecdotes (such as Hume's remark about atheists at the table of Baron d'Holbach), all the authorities cited (such as Voltaire and the Archbishop of Toulouse), are to be found in Buckle. All this without a hint that Mr. Adams was aware of Buckle's existence! After twenty or more nearly clear pages Mr. Adams's foot-notes again appear (p. 76), the subject being Rousseau. Remarks about him by Bonaparte, Hume, Lord Holland, Pathay, etc., are quoted. They all are given in Buckle, p. 767.

But Buckle is not the only author Mr. Adams has read with profit. He often quotes Tocqueville, but sometimes forgets his quotation-marks—thus:

ADAMS, p. 124.

The Republic, before which all Europe trembled, had to be organized in a positive and permanent form; and the form determined upon was the Directory. But no sooner were the Directors in power, than the evil influence of those revolutionary ideas of which I have spoken began painfully to show their influence. The Government had at its disposal a formidable army, and perhaps the greatest generals that had appeared in the world since the downfall of Rome, and yet it began to totter the very instant it arose. In its infancy, it was devoured by innumerable diseases; during the whole of its short life, it steadied itself with difficulty, and seemed on the point of falling under the weight of its follies and vices.

TOCQUEVILLE (MEMOIR AND REMAINS) i. 263.

One of the most extraordinary subjects of contemplation among the shifting scenes of human life, is the interior of the Republic before which all Europe trembled. The Government, which had at its disposal the most formidable army and perhaps the greatest generals that had appeared in the world since the downfall of Rome, tottered at every instant, steadying itself with difficulty, always on the point of falling under the weight of its vices and its follies.

Chapter IV. of Mr. Adams's book is called "The Rise of Napoleonism," and was first printed as a review of Lanfrey and other works in the *North American Review*. Now, there are various kinds of reviews, all equally legitimate, provided only that in writing one kind the reviewer does not pretend to give another. A review which simply sums up and condenses an extensive work may be very useful, though this variety is more frequently found in the *Literary World* than in the *North American*. Reviewers are sometimes exceptionally proficient in the department of study to which the work under discussion belongs, and are able to draw upon facts or opinions which have escaped the notice of the author. With this premise, let us look at Mr. Adams's work. There is not a fact mentioned which is not con-

tained in Lanfrey, yet he so manipulates the facts as sometimes to induce the impression that he is adding to and supplementing the facts. Thus, on page 150, he adds in a foot-note : "These are severe words, but here are two facts upon which they are founded," and gives the letter to the Archduke Carl, and the story of Napoleon's skirmish to amuse his mistress, crediting the latter to Las Casas. This credit of course is given with the text in Lanfrey, p. 178 (Eng. trans.) It should also be said that whole pages of his article are but free translations from his author.

Not even Mr. Adams's title is original, for about three years ago Mr. H. Reeve published 'Royal and Republican France,' a work of precisely the same character.—Your obedient servant, M. G.

## LIFE-INSURANCE COMMISSIONS.

To the Editor of The Nation :

Sir: Permit me to correct one or two of the erroneous statements of your correspondent under the above caption on page 375 of the last number of your paper.

So far from the commissions of the company named by him being only two per cent. upon the premium receipts, I venture to say they are fully five times that ratio. The exact items cannot be ascertained from the reports of that company, but the ratio of expenses of management (including commissions to agents, which are fully one-half) was 20.16 per cent. in 1873 (see Report Insurance Commissioner of Massachusetts, 1874, page xxxv.)

But it is not my purpose to speak of individual companies. The average ratio of expenses to total income (including interest upon investments) among all the life-insurance companies doing business in Massachusetts during the eight years 1866–73 was 16.60 per cent. (Official Report Ins. Com., 1874, pages cii.–cv.) This was equivalent to an average annual expense of about six and one-half per cent. of the entire accumulated assets of these companies, while the savings-banks of that State were managed during that time at an average annual expense of less than three-tenths of one per cent. Now, six and one-half per cent. is about as much as can be realized as interest on investments by a well-managed savings-bank. Hence it will be seen that a sum equal to the interest earnings upon the entire assets or accumulated deposits of policy-holders of all the life-insurance companies was annually consumed by them in expenses of management! And yet your correspondent, an editor and ex-agent, claims that no similar business in this country is managed at so small an expense! Comment is unnecessary.

Not only are the expenses of our companies enormous and beyond all reason, but the terms upon which policy-holders can terminate their insurances and withdraw their deposits—their own money, paid in advance for insurances or endowments in the future—are unjust and unequal. This tax is seldom less than fifty per cent. of the deposits, while in many cases it amounts to a confiscation of the entire amount.

What is needed in life insurance is a reform in the contract itself; greater economy and accountability of management; and a covenant to return the full *equity* of a policy-holder in the assets in cash should he from choice or necessity terminate his insurance. Life insurance as hitherto administered is on the wane. There is less in force to-day than there was two years ago, and it is steadily diminishing. The best among the companies find it difficult to hold their own.

If we would have life insurance occupy the position it ought to attain, the companies must conduct the business upon the consolidated principles of security, economy, equity, and accountability.

Sheppard Homans.

Western Union Building, June 4, 1875.

To the Editor of The Nation :

Sir : Your correspondent, Prof. Newcomb, in urging the abolition of the agency system by life-assurance companies, fails to use what may well be deemed one of the strongest arguments against it. Were the honest statements of a large number of successful life-agents to be procured on the subject, it would doubtless be found that the most potential argument habitually used in the procurement of applications, even among the best of them, is a *bonus* allowed to the applicant out of the agent's first year's commission, amounting in some instances to the entire commission. The agent who will give up to the applicant the largest portion of his own earnings from the proposed transaction is the one most likely to succeed in securing the application, with little or no regard to the comparative excellence of the companies represented. This is an evil which of course has resulted from the fierce competition between the companies for business. Some agents do not follow this practice, but almost all deprecate it, and, when complained of, plead self-defence—that others do it, and they must do it or lose business which they might otherwise secure. The assumed necessity of doing business on the "high-pressure plan," as a means of actual safety to the companies, is the real secret of their fierce and degrading rivalry, and, while some of its results, in the way of immense volumes of "new business" transacted in a given time, are astonishing, other results, among them the enormous and disgraceful increase of the "expense ratios," are, to the policy-holder (when he understands them), quite disheartening.

Truly, it will be the millennium of life assurance when the companies can secure enough business to keep them from insolvency without the use of agents, but it would seem that the time has hardly yet come for dispensing with their services. People *will not go* to the life offices and take out policies without solicitation, and no one can solicit unless he is fully and intelligently prepared, by proper study of the subject, for such duty. Your correspondent certainly realizes the evil, only it is worse than he supposes, for instead of ten per cent. of the premiums being devoted to the payment of agents, there are few companies whose commissions do not equal, and many exceed, *twenty-five* per cent. But there must be a very great change in the uninsured, so that they will voluntarily seek insurance, before we shall have done with that much-maligned and long-suffering public benefactor, the life-insurance agent.—Very truly yours, An Old Agent.

## A YALE Ph.D.

To the Editor of The Nation :

Sir : The account which you recently published of the taking of the doctor's degree at a German university only deepens the impression made upon me by a similar story in Hart's 'German Universities.' The German thoroughness confronts us as something almost unattainable; but I believe we have at Yale and Harvard courses of graduate study which demand very exact work of a man, and which terminate with no laughing matter of an examination. Not by way of complacent comparison with the far superior German system of education, nor at all by way of boasting, I venture to send you a very brief account of my examination for the degree of Ph.D. at New Haven two years ago. There was no "swallow-tail" nor white kids about it; in fact, it was decidedly a "short-hair" performance; but I felt, when I was through the ordeal, as though the faculty must know microscopically what I had been doing for the two years previous.

I had devoted myself principally to Sanskrit, Indo-European comparative philology, and Greek dramatic literature. About three months before the close of the second academic year, I sent in to the special faculty of the Graduate Course a scheme of the work which I had done (partly in private and partly under direct instruction from them), offering nearly all of it for examination, and stating the subject on which I proposed to write a thesis for their inspection if allowed to be examined. My proposals were accepted, and the time set for my examinations. I spent the intervening time in preparing my thesis, for which I had simply taken a few notes, in collecting and copying my lecture notes, and in reviewing and comparing the texts which I had read. My first examination was in the general principles of linguistic science, including, besides Prof. Whitney's book on the subject, about a half-year's lectures and discussions from him. The examination was entirely in writing. I was handed a list of eight leading topics, on six of which I was expected to write a short but comprehensive paper. I wrote three hours steadily, and finished somewhat hurriedly five out of the eight topics. My next examination came two days after in Sanskrit. I had mastered the grammar after a fashion, and read five or six books of the Nala, two of the Hitopadesa, and a little more than half of the Bhagavad-Gita. The examination was oral, and when I say that Prof. Whitney conducted it I need not add that it was searching.

A day or two after I met the same professor again, and was requested to write what I had to say upon six topics in comparative grammar (Ind. Eur.) The outlines of this subject had been given us in lectures, and we had done more or less reading in connection with them. If I remember rightly, I showed much favoritism in treating the different topics.

Lastly came my Greek. I had offered for examination four plays of Æschylus, including the Orestean trilogy, two of Sophocles, two of Euripides, and three comedies of Aristophanes, no plays read in the academic course being counted. To accompany the study of the choral passages I had read all of Theokritos, but did not review this for examination. My examination in this department was oral and written, lasting four hours, and covering every conceivable topic of any importance, as it seemed to me. This over, I presented my thesis to Prof. Packard, its subject falling within his department, and went off for a vacation. I was not told whether I passed "summa cum laude" or not, probably to spare my feelings, though

I believe no distinct grades are recognized in the degrees. It might have a good effect to introduce them.

It is still my *summum bonum* to study in Germany, but I really believe that we have a *bonum* here in America.

Very respectfully yours, PH.D. (New Haven).

HARTFORD, May 30, 1875.

# Notes.

THE 'American Newspaper Directory' for 1875 of George P. Rowell & Co. is slightly bulkier than that of last year, and shows no falling off in the care with which it is edited. The newspaper business, according to the summary in the preface, was not prosperous in 1874. There was, to be sure, an unprecedentedly large number of new journals started, at the rate of almost six for each working day, but the net increase was less than a third of this number, and more papers than usual changed hands, were reduced in size, or were suspended altogether; and generally there was a material decrease in circulation. Indiana was most prolific in fresh ventures (84), the nearest approach being Iowa with 55, Illinois with 54, and Missouri with 49; among Eastern States, Pennsylvania took the lead with 38.——G. P. Putman's Sons' 'Best Reading' appears in a revised edition, with a supplement, and with a select classified list of English and American publications in 1872–73. A similar hand-book is 'What and How to Read,' by G. A. F. Van Rhyn (D. Appleton & Co.), but it is hardly so well classified or so discriminating as the foregoing. The defects of both may be seen under *Darwinism* in the former, and under *Evolution* in the latter.——Hurd & Houghton's handy 'Satchel Guide to Europe' appears in its fourth annual edition, with revisions to a late date. Is it not, however, an error on p. xiv. to say that our "Government tax of five dollars [on passports] is abolished"?——'The French at Home,' by Albert Rhodes, with numerous illustrations, and a new story by "Edward Garrett," are among the summer announcements of Dodd & Mead.——J. B. Lippincott & Co. have in press: 'The Undivine Comedy, and other Poems,' by Count Sigismund Krasinski; 'The Mystery; or, Platonic Love,' by Geo. S. Crosby; and 'Principia; or, Basis of Social Science,' by R. J. Wright.

—"A letter just received from the writer of the account of the examination for a degree at Heidelberg," writes a relative of his, "which was published in the number of the *Nation* for May 20, says he was mistaken in the statement that he was the first American to receive the degree of Ph.D. *summa cum laude*. It had been conferred before, but it seems not to have been known to any of the American students at the university, nor to any of his German friends there. I may add that the young doctor left town immediately after receiving his degree to pass the vacation at Paris, and that this correction was made in the first letter written after his return, on learning of his unintentional mistake."

—The next Revolutionary event concerning which we must all post ourselves in order to celebrate its hundredth anniversary intelligently, is of course the battle of Bunker Hill. Three years ago a summary account of this engagement was compiled by Mr. David Pulsifer, and published in handy form by A. Williams & Co., Boston, and, with the correction of a few typographical errors, it is still to be recommended as a vade-mecum for those who mean to attend the celebration next week. The contemporary map of Boston and Charlestown which it gives is alone worth the price of this little work, and is in fact complementary to one just issued in connection with Mr. Richard Frothingham's history of the battle (Boston: Little, Brown & Co.) This is in every respect a fuller work than Mr. Pulsifer's, and treats with all the minuteness possible at this day the disposition and action of regiments and individuals on the American side. Mr. Frothingham reproduces the spirit of the times without importing into it any of his own feelings, and the British tourist can safely pocket his faithful and unbiassed narrative and read it at the very foot of the Monument without a blush. It will not only keep him from the common error of his countrymen in America who shudderingly glance up the lofty shaft when pointed out the spot where Warren "fell," but will also introduce him to several other heroes who, partly because they survived the battle and partly for social reasons, have not acquired the same renown as the Boston physician. While nothing can ever detract from the bravery of Gen. Putnam, it is apparent that he has had rather more than his share of the credit of Bunker Hill. The brunt of it was borne by Col. Wm. Prescott, of Pepperell, who, like so many other officers and men, had smelt gunpowder before in the French wars. He walked the parapet of the redoubt under the British cannonade, and at the close of the fight was the last to leave the place, warding off with his sword the bayonets aimed at him on all sides. "He did not run, but stepped long, with his sword up." He was the grandfather of the historian Wm. H. Prescott, who married a grand-daughter of Capt. Linzee, commanding the British sloop-of-war, the *Falcon*, a participant in the cannonade which Prescott braved so coolly. The crossed swords of these two grandfathers may now be seen by the curious in the rooms of the Massachusetts Historical Society. The rail-fence breastworks of Bunker Hill would doubtless have attracted more attention at the time, and perhaps have played an important part in the subsequent warfare, had they given the Americans victory instead of helping to make defeat glorious. The same humble bulwarks turned the scale at Gettysburg against the attacking army. Their earlier and their later use seems to confirm Putnam's homely dictum, quoted by Mr. Frothingham, that "the Americans are not afraid of their heads, though very much afraid of their shins: if you cover these, they will fight for ever."

—The *Tribune* proposes, in the interest of native literature, that every book received under the copyright law at the Library of Congress (which perhaps we may in time come to designate as the National Library) shall be at once entered in the card catalogue, by having "the title and all necessary information" put in type, with the needful cross-references. Of the card or cards thus prepared as many impressions shall be made as the librarian "has libraries on his list of correspondence," these libraries paying for the privilege "a very slight annual subscription fee." The *Tribune* thinks "it is plain that a very minute system of indexing would thus be stimulated" (it certainly would in the National Library), and that the corresponding libraries would receive notice of every publication issued in the country. "They may only buy a tithe, but as fast as they buy a book they would have its title-card all ready, only waiting for shelf and alcove number." This conclusion of a grand scheme reminds one forcibly of the Toodles principle in buying door-plates. The fact is that the catalogue proposed would furnish very little if any aid to the minor libraries in making their purchases, above what they can get readily and gratuitously from the various publishers' circulars and the trade-organ; and on every account we do not see why it should be restricted to our meagre even if respectable native literature—and not extended to every kind by which the National Library is enriched. There is no need, of course, to discuss the advantage for the smaller libraries of owning the catalogues of the larger, and the more the better; but when these take the shape of cards, the cost of providing room for such an index to universal literature (for that is what it amounts to) may easily exceed the whole purchasing income of a weak institution. This part of the cost has not received the *Tribune's* consideration, and we suspect that Mr. Spofford would say that the other part, namely, that of printing and distributing the cards, has been much underestimated. The prevailing practice is to write cards, instead of printing them, and even that has been found tolerably expensive; but it is vastly more expeditious than printing, and an invention like the papyrograph would seem to furnish the requisite facilities for producing duplicates. As for the "saving of a vast amount of clerical labor" by the *Tribune's* method, it may be questioned whether this is any proper concern of the Government, and whether the result would be to foster intelligent cataloguing or the reverse.

—Most people who have heard of the Yosemite Valley have also heard of Mr. J. M. Hutchings, whose house of entertainment has so long been one of the "institutions" of the place. He has been recently ejected from the Valley by order of court, and so great were the rejoicings over this event that guns were fired by some of the citizens of California, and other demonstrations made, which, coming to the ears of Mr. Hutchings, caused him and his friends so much pain that a counter-demonstration of Yosemite tourists was determined upon; and a meeting was held on the 19th of last month, the presiding officer being General Garfield of Ohio, at which a resolution of sympathy and indignation was unanimously adopted. This resolution, the construction and grammar of which are somewhat peculiar, declares that, "Whereas, The name of J. M. Hutchings is intimately connected with Yosemite Valley and its history, and who, by his pen, his lectures, and his enterprise, has unfolded the grandeur, the sublimity, as well as the beauty of this charming Valley, so that it has now more than a national reputation, to which the tourists of the world turn with delight; and whereas, on his ejection from his hotel and his home, which he has so honored and made pleasant to thousands during the past twenty years, certain men, from envy or malice, have, by the firing of guns or other powder preparations, outraged, in their mad triumph, every sense of propriety"; therefore, those present "hereby condemn this outrage here perpetrated," "extend to Mr. Hutchings" their "cordial sympathy and good-

will," express the hope that "malice and ill-will may not always prevail amidst this scene of beauty and grandeur," and also that the "old pioneer" may always "find a home to welcome his friends." The casual reader might infer from this that the "old pioneer" had been the victim of ruthless tyranny; and in order to correct this impression the Yosemite Commissioners have, through their secretary, Mr. William Ashburner, published their side of the story, which differs in some particulars from that of Mr. Hutchings.

—The Commissioners say that, in the first place, before May, 1874, the only actual settler in the Valley was a man named Lamon, so that Mr. Hutchings cannot possibly have "honored and made pleasant" his hotel and home to thousands "during the past twenty years," and that, as a matter of fact, Mr. Hutchings moved into the Valley and laid claim to 160 acres of land as a pre-emptor about six weeks before the passage of the Act of Congress of 1864, granting the Valley to the State of California inalienably "for all time." This move might, of course, be regarded by hostile critics as that of one desirous of "squatting" on other people's property, inasmuch as the Yosemite had never been surveyed by the Government, and it is impossible to gain any rights as a *bonâ-fide* pre-emptor without a survey. But however that may be, the Commissioners, not wishing to give Mr. Hutchings any trouble, providing he would recognize their superior title, offered him a ten-years' lease at a nominal rent. This he declined, preferring to stand his chances at law. An ejectment suit was begun and carried up to the Supreme Court of the United States, which decided that Mr. Hutchings had no valid claim whatever. The Commissioners, however, evidently finding Mr. Hutchings rather a difficult person to deal with, and probably being mortally afraid of what their State Legislature and Congress might do, instead of ejecting him on the spot, allowed him to remain in possession, and on their recommendation a special commission was appointed, and $60,000 appropriated by the State to indemnify all Yosemite claimants. This, of course, was not done by the Legislature unsolicited, for the old pioneer had by this time become quite a public character, a lecturer, author, and accomplished lobbyist, as may be seen from the further fact that he now got the Legislature of California to pass an act awarding to him and Lamon one hundred and sixty acres of land apiece. This act was illegal, as the land was inalienable, but of the $60,000 he got $24,000 for his "claim," which, as we say, the Supreme Court decided to be good for nothing. In November, 1874, he accepted this sum, and immediately made application for a lease, declining, however, to offer any definite amount of rent. The Commissioners proceeded to advertise the premises, whereupon Mr. Hutchings entered an appearance, and informed Mr. Raymond, one of the Commissioners, that it was fortunate he had got his $24,000, as otherwise he (Hutchings) "should certainly have assassinated him" (Raymond), adding that "he had had a gun loaded for that purpose for a long time." The place was, however, let, against the protest of Hutchings, who published a notice that he should contest any disposition of the property by the "so-called Commissioners," and that he should apply to the next Legislature for the privilege of leasing it himself. The Commissioners have, however, ruthlessly turned him out, and the poor man is now wandering about, a homeless outcast, with a fortune of $24,000 given him for a property to which he had no title, and a claim against the State for the injustice done in giving him the money. Considering the relations of the United States to the Valley, it would be interesting to know what the grounds of sympathy for the old pioneer on the part of Mr. Garfield are, and how he can explain his behavior in presiding at this ridiculous meeting.

—We learn from the prospectus of Sainte-Pelaye's 'Dictionnaire Historique,' just received from F. W. Christern, that the completed work (see the *Nation*, No 513) will consist of ten volumes in 4to, of about 500 pages each, and will be issued in one hundred numbers. The subscription price will be three francs a number for copies on hand-made "papier des Vosges," and five francs for those on Holland paper, of which a small number only will be printed. The subscription list will be closed as soon as it contains five hundred names, and the price per number advanced to five and eight francs. The names of the subscribers will be published at the end of the last volume, and they will receive gratuitously a supplementary number containing the titles of the MSS. and editions from which the author has taken his citations. It is hoped that the work will be finished in two or three years. The prospectus further contains the 'Projet d'un Glossaire François,' published by Sainte-Pelaye in 1756: it is followed by some specimens of the proposed glossary. We may properly mention here that Auguste Brachet has lately prepared a French grammar for secondary instruction, which is designed to awaken in younger students an interest in the historical study of their language, and may be advantageously consulted by older scholars on this side of the Atlantic who seldom stray beyond the covers of Fasquelle. We observe also that Hachette announces as in press, by the same author, a continuation of the extracts from the older French writers, entitled 'Recueil de morceaux choisis des écrivains français du IXe siècle à la fin du XVe.'

—Guizot's library proved less rare and valuable than the public was led to expect from his long literary career, and the same thing is to be said of his collection of autographs, which was sold last month. The number of them was inconsiderable. A letter of Napoleon's (Oct. 11, 1791) to Pozzo di Borgo fetched 620 francs, and 1,000 were paid for letters from Cardinal Richelieu to the Duc de Luynes which were well worth the money. A doubtful joint letter of Marie-Antoinette and Louis XVI. to the Princesse de Lamballe found a purchaser at 450 francs. For some reason a letter of Madame Elizabeth's (the sister of Louis XVI.), though entered in the catalogue, No. 3,799, was not put up for sale. That it is a forged autograph is clearly proved in *Polybiblion* for May by M. de Beaucourt, who six years ago published an *Étude* on the letters of the lady in question, in which he enumerated sixteen instances of this kind of fraud which had been perpetrated upon her. They are all, including the seventeenth, which had deceived M. Guizot, and one in the British Museum, counterfeits of original letters addressed to the Marquise de Raigecourt, and which have never been out of the possession of the family of the recipient. Great liberties were taken by the falsifier, who omitted whole passages at pleasure, apparently to suit the size of his paper, and who also corrected freely the faulty grammar and orthography which characterize the genuine productions of Madame Elizabeth. The fourth volume of Guizot's 'History of France' for young people has appeared, and ends with the death of Louis XIV. From this period to 1789 the work will be taken up and completed by Mme. de Witt, in accordance with the plan, notes, and suggestions of her father, whom she had assisted on the volumes already published.

—English readers of Manzoni's incomparable romance, 'I Promessi Sposi,' have doubtless often felt the need of some commentary to explain its many historical allusions, and to throw some light on those two mysterious characters, *l'Innominato* and the nun of Monza. Such a comment was prepared as early as 1831 by the now famous Italian historian, Cesare Cantù, and has been frequently reprinted since then, both separately and together with the romance it explains. It has been for some time out of print, however, and we are glad to call our readers' attention to a new and cheap edition, 'Commento storico ai Promessi Sposi, o la Lombardia nel secolo XVII." (Milan, 1874, price two francs). It contains in an admirable form everything necessary for a full understanding of the 'Promessi Sposi.' Many of the illustrative documents are drawn from the various Italian archives, and are here published for the first time.

## GENERAL SHERMAN'S MEMOIRS.*

I.

IT is a pity that a book of this kind should be received with an outburst of partisan attack and partisan laudation, and yet, such is the public temper just now, that anything like a calm judgment seems next to impossible. The personal recollections of a great soldier ought not to excite political feeling, and, nevertheless, the criticisms on Sherman's 'Memoirs' are very generally colored by the politics of the writers of them. To us it seems that it would be difficult for an important public character to show that he had "turned his back on politics" by any better proof than the publication of such a book. If there is anywhere in it a purpose to court political favor, we are quite unequal to the subtlety required to discover it. To our way of thinking, the man would be crazy indeed who should expect it to help him into the Presidency; and no less a quarry is supposed to be worthy the aim of the writer. It looks to us like a more intelligible and explicit renunciation of worldly ambition than the President's late letter to the Pennsylvania Republicans; and we cannot, by any effort of the imagination, make a hope for a political nomination consist with the printing of so much matter that will touch powerful enemies on the raw.

The history of the book itself gives a better notion of the reasons for its existence, and in a way that is natural and simple enough. General Sherman had determined to do what all of us thought he ought to do. He wrote his recollections and impressions of the events of the late war, intending to leave them for publication after his death. No doubt he was urged in many ways not to defer so long the satisfaction of public curiosity, and to a man of his temperament there would be much force in a shrewdly put argument

* 'Memoirs of General William T. Sherman. By Himself.' Two vols 8vo New York: D. Appleton & Co.

that it would look timid, and as if he did not choose to face the storm of his own brewing, if he should postpone the printing till after his death. At any rate, by one argument or another, he was induced to change his mind and publish immediately, and if he enjoys a breeze he certainly has enough of it. A book written for posthumous publication must, from the very nature of the case, need rewriting before most people would think of giving it to the world whilst its sharp things could return to plague them. We tickle our ribs with the descriptions Greville gives of such scenes as that between William the Fourth and the Duchess of Kent at the King's own table; but fancy the courtly Clerk of the Privy Council publishing any such "truth of history" during his own lifetime! The very thought would have been apoplexy to him. But General Sherman is not a Clerk of the Privy Council, and though he would probably have suppressed some of the more piquant bits of gossip or of personal criticism if he had had a literary mentor at his elbow to hint at the conventional differences between posthumous memoirs and other history, we suspect that for lack of other fighting he more than half enjoys the rattling skirmish just now going on in his literary front.

Certainly the book is not dull. Josh Billings's hornet was scarcely less so. One is strongly impressed with the belief that the author has a naïve unconsciousness of saying anything stinging, even when describing his impressions of Frémont in California or McClernand's enthusiasm after the fight at Arkansas Post. The style is generally direct and clear, having the prime merit of telling plainly what the writer had seen and felt vividly, and consequently the sympathy of the reader goes strongly with him to the end. Military memoirs of the personal kind are among the most fascinating of books, and Fezensac's narration of his experience in the wars of the Emperor Napoleon is a late and admirable instance in proof of the fact that even the petty personal relations of the writer give life and oftentimes charming color to the scenes. To know what to tell and what to leave unsaid is a matter of literary instinct quite as much as of training, and we must not complain if all do not have the artistic sense in the same degree. An autobiography is necessarily and essentially egotistical, and this one is no more so than the average, whilst very few of those who have taken the world into their personal confidence have a better right to assume that the world will be pleased with the intimacy.

The narrative opens with the author's reporting for duty as a lieutenant of artillery at Fort Moultrie in the spring of 1846. There is something dramatic in the beginning of such a career at such a place, and Sherman's immediate associates were nearly all men destined to play an important part in the war of the Rebellion. There were Robert Anderson, Halleck, Thomas, Ord, Reynolds, and T. W. Sherman, who did good service in the Union armies afterward, and of those destined to bear arms for the Southern Confederacy there were Bragg, Ewell, and C. Q. Tompkins. It is only by learning how close and intimate the life of the old army officers made their association with each other, that we can understand how the Rebellion cut through their best friendships and rooted up the nearest relationships in life. A sense of this evidently prompted Gen. Sherman to enumerate the list of young soldiers who then began with him their military career.

The narrative of the occupation of California by the United States forces, the discovery of the gold mines, and its effect upon the social and political history of the country, the history of the Vigilance Committee of San Francisco, are all vividly given, and are an interesting and useful addition to the history of the Pacific coast.

Sherman's own career as a business man in civil life, from the period of his resignation from the army in 1853 till his appointment as Superintendent of the Louisiana Military School in 1859, is honorable to him, and seems fairly to show that he had the confidence of the experienced business men with whom he was connected, and that any lack of success in their enterprises was due to general causes and not to any incapacity or lack of industry or energy on his own part. So also, his conduct as managing and responsible head of the Louisiana Academy appears to have merited the approval of the State authorities, under whose control it was, and his prompt and peremptory withdrawal when a longer connection would have compromised his patriotism, was entirely in keeping with his character and his subsequent devotion to the cause of the country. The passing criticisms of the press, which seem to have made the General feel it necessary to give considerable space to these parts of his life, have been evidently better remembered by him than by the rest of us, and he could easily have afforded to let them pass without refutation. Yet the composition of any character is so much the effect of all the disciplinary processes through which it has gone, that we are perhaps more indebted to him for a clear knowledge of himself than he intended, and his self-vindication from anonymous and forgotten slanders will serve the better purpose of showing the progress of his own intellectual and moral growth.

The outbreak of the rebellion found Sherman quite ready to decide that he could not remain in a seceding State; but between the responsibility for the support of his family and the impulse to join the Union army at once, the decision as to the remainder of his duty was not so easy. He tells us enough to show two things: first, that for a time he was not disposed to take any active part in the contest, saying the politicians might get us out of the "fix" they had gotten us into; and, second, that until the call for three years' troops was issued he did not see enough in a military career to attract the ambition of a man who retained much of the feelings and modes of thought of the professional soldier. He would not go with the South, but he was only half inclined to take up arms for the North. Yet a man of military education and recognized energy, who was a brother of John Sherman and son-in-law of Thomas Ewing, could not lack invitations to return to the regular army, and, early in May, his name was sent to the Senate for confirmation as Colonel of the Thirteenth Regular Infantry, among the earliest of the appointments under the laws for the increase of the army under the organization for three years. Sherman thus found himself back in his old place in his profession, or rather in a higher place in it than he could have reached in the ordinary course of events had he never resigned. As his narrative pretty clearly indicates that he had regretted leaving the army, it is fair to assume that this mode of return to it was to him a fortunate turn in his career; and his prompt acceptance of it would be a matter of course unless his sentiments had been strongly opposed to the National Government, which they were not. His action at this juncture, therefore, may fairly be regarded as determined by professional considerations, and his zeal for the national cause, like that of many others of the regular army officers, grew during the contest itself, and in part at least by the natural influence of fighting for it. His patriotism was genuine, but he was not a Republican in politics, and was not one of those from whom came the spontaneous outburst of uncalculating self-devotion which swept through the loyal States when Sumter was fired upon.

Once in the army again, he applied himself to his work with the instincts of a true soldier and the grasp of a man of quick and clear intellect. The war gave him his opportunity, and his successes and fame were fairly the result of ability and good work. As a subordinate, he was free from intrigue and gave a loyal and earnest support to his commander. As a commander, he was ready to take the responsibility of his own acts, and usually just in awarding the due meed of praise or blame to his subordinates. It is only in the case of officers who might be regarded as rivals in his own rank that he falls into unnecessary acerbity of criticism or belittling and contemptuous comment on their actions.

In his account of the first battle of Bull Run, Sherman brings out clearly the fact that the opposing armies had neither of them acquired the coherence necessary to make it possible to handle them in the proper military sense of the term, or to prevent a check being quickly turned into a panic. His frank admission that the officers in command deserved little praise or blame for their respective parts in the action has the air of transparent truth, as does his amusing account of the receipt of the news of their promotion when Heintzelman was insisting that they were all to be cashiered instead. Equally sincere, no doubt, is his statement that when he was transferred to the West he desired that his command might be a subordinate one. His view of the difficulties of an independent command, including the dangers he had just seen raw troops create for commanders whose plans were well digested, the troublesome character of the semi-political duties of department commanders, the doubts as to his own ability to spring at once from the command of a handful of regulars to the manœuvring of real armies, all taught him to seek the safer and more modest career of a brigade or division commander whilst he should test his own powers and learn the rôle of a general. Such caution in a man of so impulsive a temperament shows a mingling of practical sense with his enterprise, and helps account for his final achievements.

His description of Shiloh, though evidently drawn from the standpoint of the Army of the Tennessee, is a pretty fair one, and does no real injustice to the Army of the Cumberland. He labors to prove that the hard defensive fight of Grant's army on the 6th of April was not a rout, nor even a surprise, but left that command in condition for a possible resumption of the offensive on the morning of the 7th; but he also very frankly admits that Buell's army made the victory certain, and praises in unstinted terms the fighting of his divisions, enumerating by name not only the division commanders, but specifying also the brigades and even regiments which attracted his attention by their gallant conduct. He says of Buell's whole command that their "soldierly movements at once gave confidence to our newer and less disciplined men," and "concedes that Gen. McCook's splendid division from Kentucky drove back the enemy along the Corinth road, which was the

great centre of this field of battle," etc. All this is in his official report, which is reproduced in full in the body of the memoirs, and reaffirmed. Certainly nothing more could be asked unless it be to admit that Grant's army did nothing on the 7th, and ought to have surrendered on the night of the 6th. The most jealous of Buell's old army officers would hardly ask that.

On another point of common criticism, however, it must be conceded that Sherman does not make an equally good defence : that is, the neglect to entrench or make any kind of cover on the front towards Corinth. The argument that such breastworks would have diminished the confidence of the troops seems wrong in theory, and wholly out of accord with all the later experience of the war. The truth probably is that the officers in command had not yet freed themselves from the traditions of European tactics, and had not learned—as this bit of experience tended strongly to teach them—the necessity of a constant use of axe and spade in a country of which almost every mile would be regarded by a European tactician as impracticable. The bitter controversy which has been had on the subject of this battle makes both Grant and Sherman chary of admitting any mistakes, but this admission they may safely make, and lose nothing but a little pride of opinion in regard to it.

In the following movement upon Corinth while Halleck was in immediate command, Sherman's relations to that officer were evidently pleasant, and a cordial and mutually appreciative correspondence seems to have continued between them down to the negotiations between Sherman and Johnston in 1865, to which we shall have occasion to advert again.

The subordinate movements of the following campaign prior to the siege of Vicksburg are well and clearly given in the narrative, and valuable light is thrown upon their relation to the general plan of campaign adopted by Grant, who was again in chief active command in the Mississippi Valley. The incident of the capture of Arkansas Post is given with spirit ; but in the treatment of General McClernand the author is fairly chargeable with saying either too much or too little. The animus is decidedly hostile, and yet the narrative does not give facts enough for the reader to feel that he has the means of judging clearly between the parties. Sherman's subsequent career lifted him too high as a military man to make it possible that the jealousy felt at the time could color his picture at this late day, yet it is quite plain that he cordially dislikes McClernand and tries to ridicule him.

The siege of Vicksburg itself is given with sufficient fulness to convey a distinct idea of the plan, and Grant is fully credited with the conception and determination of both the plan itself and the details of its execution. A letter written by Sherman during the progress of the operations shows that he would have moved to the rear of the city from the north, and he is still of the opinion that such a course would have shortened the siege materially. The letter, however, appears to have been written to call out the opinions of the other corps commanders, and instead of being intended as a criticism upon Grant's purposes, was meant to commit McClernand to some affirmative plan of campaign, and forestall any criticism after the event from that quarter. Grant, however, did not call for the opinions of the rest, nor did he modify his own. Success, as is usual, justified the course actually taken, and quickly lifted Grant to the command of all the armies of the nation.

Sherman's part in the victory at Mission Ridge is modestly given ; but his winter march to Knoxville to Burnside's relief seemed to him unnecessary, and he was evidently annoyed at finding that Burnside had comfortable headquarters within the town, and that the reports of starvation had been exaggerated. Sherman's own habit in the field was a model of simplicity and economy of transportation, carrying the reduction of headquarters baggage to the extreme limit, if indeed he did not sometimes go beyond it. As a natural result, he looked with displeasure upon every evidence that other commanders were giving some attention to their own comfort, overlooking sometimes the difference of situation between field-service and other phases of military life. Thus, he records the fact of Burnside occupying a fine house in Knoxville, subsequently does the same in the case of Banks at New Orleans, and even gives "Pap" Thomas a "little dig" in regard to the size of his field equipage. We suspect that those who served with "Uncle Billy" regarded that tent-fly of his as his pet weakness, and camp stories are even current that in hard weather his staff-officers were sometimes glad to take refuge in the more ample shelter of the headquarters of the Army of the Cumberland. If the officers of whom he records these criticisms had no severer charges laid at their doors, they would be fortunate men. Yet if Sherman erred, it was on the right side, and he is no doubt right in asserting that he was able to give his army greater mobility and impetus by setting the example of throwing away all *impedimenta*.

The first volume closes with the march to Meridian, which was a necessary means of rendering it possible to leave the Mississippi Valley in charge of only a small force when the concentration should be made at Chattanooga for a great campaign in Georgia. The Mississippi had now been opened ; the rebel force west of it hardly amounted to an army ; the destruction of railways took the States of Louisiana and Mississippi practically out of the field of grand operations ; everything north of the other Gulf States was safe ; and Sherman prepared for a formidable advance into the heart of what still remained the enemy's country, whilst Grant assumed command of the Army of the Potomac to begin the inexorable but terribly costly advance upon Richmond.

---

*A Group of Poets and their Haunts.* By James Albert Harrison. (New York : Hurd and Houghton. 1875.)—Mr. Harrison dates his preface from "Randolph-Macon College," Virginia, from which we infer that his volume has, intellectually, a Southern pedigree, as it were, and was originally addressed to Southern readers. Indeed, without this indication, we should have arrived at some such conclusion, for the author's style, on its face, reflects the fervors of a high temperature. It seems proper to give Mr. Harrison the benefit of his circumstances, and to observe that there are good reasons why he should write as he does ; but it is fair, on the other hand, to remember that Southern literature is not, by an absolutely invincible necessity, pitched in the uncomfortably high key of these essays. It is desirable, in other words, both that the Southern view of intellectual things should not seem to an author (especially if he is making his first experiments) the most felicitous and profitable one, and that the Southern mind should not accept such performances as those of Mr. Harrison for more than they are worth. Their value seems to us quite relative. Just what the Southern view of things consists of we should, ourselves, be at loss to explain : read Mr. Harrison, and you will get a notion. Roughly speaking, it consists very much more of words than ideas—of sound than of substance. Mr. Harrison handles words with a certain natural vocation for the task ; but he is a clever conjuror rather than a real magician. He does not always make the best use of his cleverness, either; he is liable to grievous slips and mishaps; the same thing, with more care, could be better done. We say with more care—with a better use of the same material ; for Mr. Harrison's book is good enough to make it a pity it is not much better. He has an excellent selection of subjects—subjects which are a proof of his having real literary and æsthetic predilections. He has apparently made a long stay in Europe, and spent his time there in a sufficiently scholarly manner. Heine, Byron (viewed in connection with his places of residence in Italy), Tasso, Boccaccio ; the picturesque aspects of Copenhagen ; Bellmann, the Swedish poet, Béranger, Chénier, Alfred de Musset—these are all remunerative themes, if one has the art to make them so. But it is hard to imagine a man taking more trouble to make less of them than Mr. Harrison has done. He is bitten with the mania of being picturesque at any cost, in season and out, and on this errand he indulges in the most fantastic escapades. His writing, half the time, reads like a repulsive rehash of the sort of literature to which Mr. G. A. Sala and Mr. Hepworth Dixon have accustomed us, and of which the London *Telegraph* is the classic exponent. We have but to open him at random for an illustration. "Venetian women are not pretty if one sees them squinting, arms a-kimbo, behind their booth-counters, inhaling the slops and slums of forty doges. They look like brunettes of Eblis. Their gibble-gabble is incessant. A little of the silent vaccine of Turkey might be introduced to advantage into the national carcass." What does Mr. Harrison mean, elsewhere, by "the rugged facts, the red-hot soberness, the telescopic vividness to which Hawthorne clings, as to the Pillars of Hercules"? What does he mean by calling Paul Veronese "that Taine of Italians"? What profit does he find in winding up an incoherent rhapsody about Hawthorne's Miriam, "whose character has the purple opaqueness of clouded amethyst," with the statement that in the contours of the Faun of Praxiteles "there is focalized the whole of an extinct civilization, there is unsphered from the mere pictorial symbol the glorious fearlessness and freedom and energy that triremed the whole Mediterranean and hamstrung the monarchy of Xerxes"? What is he thinking of when he calls Lord Byron "the stereopticon of British poets"? What does he mean, above all, by producing such an unsavory passage as that on page 38, relative to what he calls the "flowery vices" of Lady Byron? The taste of such stuff as this strikes us as simply depraved ; neither reason nor imagination has anything to do with it.

The whole article upon Byron is extremely bad; both the sentiment and the style are in the highest degree sophomorical. Mr. Harrison's judgments seem to us throughout of singularly little value, and his whole manner of criticism extremely flimsy and erratic. His characterizations have neither head nor tail, neither beginning nor end; he has an extraordinary faculty for turning his topics upside down and grasping them by the wrong handle. The reader fairly rubs his eyes when he stumbles upon such lines as these, touching Alfred de Musset: "His romance, 'Confessions of a Child of the Time,' is written with great and uncommon excellence. . . . The cheerful realism of the man has made him almost as great a favorite as Reuter with his countrymen beyond the Rhine. More than any French writer, he recalls Goethe, strangely enough; then a gleam of Rabelaisian fun reveals his intimacy with the French humorists of the sixteenth and seventeenth centuries" De Musset's "cheerful realism" and his analogy with Reuter, Goethe, and Rabelais are points which we hardly expected to live to see expatiated upon. Mr. Harrison's fault is not simply that he is too fervid and florid and fanciful; but he is astride of the wrong horse altogether, his foundations are quite unsound. He gives us a long rhapsody on the Swedish poet Bellmann, whom we do not know, but whom he declares a most delightful genius. This is excellent; but it will hardly be believed that in support of his eulogy he does not offer a single specimen of his author, a scrap, a line of quotation. He talks to equally vain purpose of the Provençal poet Jasmin. A few grains of example substituted for his great redundancy of precept would in each case have been welcome. Mr. Harrison is too fond of his own rhetorical flourishes to sacrifice one of them to his subject, and his subjects therefore, *quâ* subjects, fare very badly. If we seem to be taking his indiscretions unduly hard, it is that he seems to us really to have a literary gift which ought to be turned to better account.

---

*Home Sketches in France*, and Other Papers. By the late Mrs. Henry M. Field. (New York: G. P. Putnam's Sons. 1875.)—This little work will have a value to many persons as a memento of a woman of much social eminence—a woman who introduced into quarters where they would otherwise (and regrettably) have been little known, those gifts and graces which we are taught to attribute to the social and conversational play of the French mind. This will be its chief value, for the papers of which it is composed are of a slight and unpretending sort. They are agreeable, however, and indicate the multiplicity of the author's interests. Some of them, at least—the private letters from Europe—were originally written in French, and we are sorry that the editor should have thought it necessary to translate them. Easily, apparently, as Mrs. Field handled English, it is probable that in her own tongue her style had a stronger savor—a savor of which her many friends would have relished a literary memorial. If the letters contributed directly to the press were written by Mrs. Field in the excellent English in which they now appear, this seems to us a remarkable literary feat. But even if they suffered certain corrections, it is perhaps not fanciful to see in them, slight and amateurish as they confess themselves to be, a trace of that natural neatness of style, that instinctive sense of shapeliness, which is perhaps the most characteristic sign of the charming race to which Mrs. Field belonged, and so many of whose virtues (even the incongruous ones) she apparently contrived to reconcile with so many of ours.

---

*Text-Book of Botany, Morphological and Physiological.* By Julius Sachs, Professor of Botany in the University of Würzburg Translated and annotated by Alfred W. Bennett, M.A, etc., assisted by W. T. Thisleton Dyer, M.A, etc. (Oxford: Clarendon Press; London and New York: Macmillan & Co. 1875. pp. 858, 8vo.)—*Traité de Botanique conformé a l'état présent de la Science.* Par J. Sachs, etc. Traduit de l'Allemand sur la 3e édition et annoté par Ph. Van Tieghem. (Paris: Savy. 1874. pp. 1,120, 8vo.)—Sachs's 'Lehrbuch,' the renowned German text-book for structural and physiological botany, is now accessible in French and English—the translation made by Van Tieghem and issued last year being followed by the rather better one by two young English botanists, which the Clarendon Press has now brought out in a style which leaves nothing to be desired. Both are from Sachs's third edition, but the English editors have been able to make some use of the fourth, which was concurrently passing through the press in Germany. The Würzburg Professor has been taking the lead in vegetable physiology, while maintaining a conspicuous although less unchallenged eminence in vegetable anatomy and morphology. In one or more of the three languages this text-book will be the *vade-mecum* of the advanced student. The woodcuts are equally well reproduced in the two translations; and the editorial notes are about equally numerous. Those of the English editor are mainly simple references to other sources of information, while those of the French editor are largely critical, Van Tieghem being himself a leading histological and morphological investigator, with pronounced views of his own, some of them peculiar. What we are entitled to expect from the English editor and his associate—both botanists of high promise—is a correct and clear translation of the German work (no small or easy matter), and this we here have. Indeed, the rendering seems to us to be particularly happy, and the whole appearance of the volume is most satisfactory.

Any special reference to the contents of the volume would lead us too far, especially if we attempted ever so concise an exposition of Sachs's strong points, which lie in the domain of molecular and somewhat mechanical physiology. It would be instructive and curious to contrast his way of regarding the movements and action of plants with Darwin's. It is worth remarking that Sachs adopts the theory of descent, and in a sensible and practical way, mainly because of the light it throws upon morphology and development.

# The Nation.

*NEW YORK, THURSDAY, JUNE 17, 1875.*

## The Week.

THE New Hampshire dispute has ended without bloodshed, the judges having refused to consider the questions submitted to them. In this they were evidently right, and, indeed, it is difficult to see how they could ever have been expected to solve the question as it was put to them. When it was announced ten days ago that the matter had been referred to the courts, we supposed it was to be brought before them in the usual way as a matter of disputed right between two persons, or, under the New Hampshire constitution, in the form of a request for instructions coming from the Governor and Council. But, far from this, the politicians seem to have referred the whole affair to the judiciary for arbitration—a duty which they very properly declined to undertake. On the opinion of the court being announced, the House and Senate proceeded to the election of a Governor, which they accomplished without much difficulty, or any loss of life on either side, the Republicans carrying the day, notwithstanding the presence in the Senate of the two Democratic Senators who have given so much trouble.

The Court of Appeals has reversed the decision of the Court below in the Tweed *habeas corpus* case, and ordered his release. The Judges were unanimous—Judge Grover, though absent, concurring. Tweed was indicted for several offences in one indictment, and each offence was charged in a separate count, and for each count on which he was found guilty the Judge inflicted a separate penalty, amounting in the aggregate to twelve years' imprisonment. The Court holds that this was illegal, and that when the Judge had imposed the penalty of one year's imprisonment and $250 fine he had exhausted his powers. As Tweed will be immediately rearrested in several civil suits and under other indictments, the decision will be of little immediate service to him except in securing his removal to a more comfortable prison. It may save editors in other States some useless declamation to say that the judgment of the Court of Appeals commands the respect of everybody who knows anything about the matter in hand.

New evidence has during the past week made its appearance in the Beecher case in the shape of a "statement" by Carpenter, the artist, and the discovery by the *Herald* of the druggist who sold poison to Mr. Beecher, and two workmen who happened to be witnesses in Tilton's house to some improper familiarities between Mrs. Tilton and Mr. Beecher. Carpenter's statement does not throw much light on the case, though it brings out some curious scenes in the Tilton household, as, for instance, one in which there was a sort of consultation or discussion between Tilton and his wife, in the presence of and partly assisted by Carpenter, as to how she should make a statement of what her sin had been. The *Herald* story is more important. The Tilton press (it is really not unfair to say that many of the newspapers are as distinctly committed on the merits of the case as they are to one or other party in politics) receive it with great manifestations of approval, while the Beecher press maintains its utter improbability. In any other case, we should say that a story of a well-known clergyman, who desired to make away with himself, walking into a druggist's shop and, after first conversing pleasantly with the druggist for half an hour on the effects of different kinds of poison on the human system, calling for a bottle of prussic acid, and carrying it off, was in the highest degree unlikely to be true, as would also be a story of a well-known clergyman's committing gross acts of familiarity with a woman, almost in the presence of two workmen. But we must confess that reading the Beecher trial regularly has dulled our sense of the difference between what is probable and improbable, as well as between what is decent and indecent.

The Chicago *Tribune* publishes some interesting testimony taken by a Master in Chancery in a foreclosure suit brought by the Union Trust Company against the Rockford, Rock Island, and St. Louis Railroad. In 1868 this road placed on the market a loan of $5,000,000 through Mr. H. H. Boody, the principal financial agent of the Company; but it seems from his testimony that the proceeds were not all applied to the direct construction of the road, but that $120,000 were put into the hands of influential editors and publishers of newspapers, the best known of whom was Mr. Henry C. Bowen of the *Independent*. Mr. Bowen received $40,000 in bonds, and agreed, on his part, in consideration of this sum, to "thoroughly write up and endorse the enterprise," and also to publish "as editorial" anything that Mr. Boody should from time to time write on the subject, and Bowen was also to give "his personal influence in connection with his acquaintance among bankers and others." This contract, according to Mr. Boody's testimony, was faithfully carried out. He also testified that he did not make the proposition to Bowen, but that the latter applied to him, and on being asked to explain made this reply: "The writers of the financial articles of the New York papers have a way of very distinctly communicating their wishes to persons situated as I was without stating it in very broad terms. I knew very distinctly from what was said that the alternative was their opposition or support." Some time ago we called attention to a similar contract on the part of Mr. Bowen with the Northern Pacific Railroad. We again bring the matter to the notice of the theologians who write for his paper.

Wall-Street speculation has been in a state of feverish reaction. Whether this condition was a natural collapse following the excessive activity of late weeks and likely to continue through the "heated term," or is simply a halt pending the truce between the railroads, remains to be seen. Opinion inclines to the conclusion that, as great schemes of railroad reconstruction and consolidation are pending, the summer speculation is likely to be unusually active. Some surprise is felt that Mr. Garrett's defiant talk at Chicago should be so soon followed by negotiations for peace, and on terms which appear to give Mr. Scott an advantage. The fact of a basis of settlement between the competing roads having been reached has a reassuring effect among holders of railroad securities; nevertheless, the war has had the misfortune of leaving in the minds of investors a feeling that even the most solid of corporate investments may be imperilled by the recklessness of virtually omnipotent presidents. The foreign exchanges continue exceptionally firm, and gold, in sympathy with the scarcity of sterling bills, verges closely upon 117. The $20,000,000, more or less, of five-twenties to be returned from Europe, in response to the "call" on account of the Sinking Fund, are going rapidly into the Treasury for payment; and, as merely nominal amounts of other securities are sent abroad to replace them, it seems likely that our exports of gold may be augmented by nearly that amount. The exports of specie from this port last week amounted to $4,674,000. So far, the large contributions we are making to the bullion reserves of the Bank of England have had little effect on the London money market; although, from all precedent, it would seem they must soon quicken the demand there for American securities.

General trade still lacks symptoms of revival. Although stocks of merchandise are moderate, merchants show great anxiety to sell, and reductions in prices are made which must render the result of the season's trade unsatisfactory. Manufacturers show a disposition to diminish rather than augment their production in anticipation of the fall business; and the markets for raw materials generally are

consequently weak. Southern advices warrant the expectation of a large cotton crop, and also afford evidence that the cereal product of that section is likely to exceed all precedent, leaving a surplus for export. Setting off this gain against the deficiencies of some other sections, it seems probable we shall have about an average supply of breadstuffs from the approaching harvest. Washington reports indicate that, owing to the large payments on account of the Sinking Fund, the Federal expenditures of the fiscal year to end on the 30th inst. will exceed the income by fully $20,000,000. The cash resources of the Treasury are ample enough to make up this deficiency without the drain being seriously felt.

---

Judge Dillon, of the United States District Court in Iowa, recently rendered a decision, which we have already noticed (*Nation*, May 27), in which he declared railroads to be in their public character "improved highways, whose life is due to the exercise of the State right of eminent domain and taxation," and held that their public character was not divested by the fact that the ownership was private, and, therefore, that the Iowa Legislature might control the charges of the State railroads in its discretion. This is the kind of law the Grangers like. The Burlington (Iowa) *Hawkeye* has, however, now disinterred a decision of Judge Dillon's, made in 1869, when he was Chief-Justice of the State Supreme Court, in which he furnishes a totally different account of the law. In the latter he says railroad companies are "mere private corporations, voluntarily organized for pecuniary profits," whose ultimate business is "that of a mere common carrier." He added: "If the legislature could abolish railroad corporations, restrict their chartered powers, control their rights and property, the same as they can do with respect to municipal or civil corporations, there would be some ground for holding that they are not essentially private. . . . . That such corporations are private, and not public, is a principle of law so well settled that it has not even been questioned by counsel. No case can be found which denies it."

---

He went, however, even further than this, in the following remarkable passage: "It is to be remembered also that railway corporations are not organized for the purpose of developing the material prosperity of the State. This is a mere incident of the business they prosecute. But they are organized solely to make money for their stockholders. The Legislature has no more power over their property or rights than it has over the property or rights of natural persons or other private corporations organized under the same general law." The explanation the uncharitable foreign investor will be apt to put, we fear, on this extraordinary specimen of judicial wabbling within the short space of six years, is that in 1869 the Iowa farmers were engaged in a very discreditable attempt to repudiate the town and county bonds which had been issued in aid of railroad construction, and Chief-Justice Dillon was ready to help them, by laying down one theory of railroad property; that in 1875 they are engaged in another attempt, equally dishonest, to force the railroads to carry their produce at non-paying rates, and Judge Dillon is ready to help them by laying down another theory of railroad property directly opposed to the former one. We are glad to see the *Hawkeye* warning the people of Iowa of the effect of these performances on the development of the State. Judge Dillon may help them to cheat the present holders of railroad property, but he cannot help them to get more railroads built.

---

When Messrs. Phelps, Dodge & Co. were being pursued by the Custom-house informers under the most trying circumstances, Mr. H. B. Claflin had no hesitation in throwing the weight of his opinion against them, and giving the moiety-men a kind of certificate of character. He assured the Committee of Ways and Means that "honest men had nothing to fear" under the rule of Jayne, and that if his own books and papers were seized, he would "get out of trouble very quickly" if he showed that "all was honest and right." We must say that this appearance of his has considerably diminished the regret with which the public have heard of the recent indictment of his firm by the Grand Jury, on a charge of having knowingly bought smuggled silks. Now, an indictment by the Grand Jury is and ought to be, a far more serious thing than a seizure by Jayne, because the Grand Jury is a legal tribunal composed of respectable and disinterested men, who hear sworn evidence, and when they say, by finding an indictment, that there is good reason for further investigation, they justify the public to a certain extent in believing there is something wrong. Jayne, on the other hand, was an unprincipled adventurer, who collected information secretly from whatever source he could, and had a large pecuniary interest in accusing his victims, and began his proceedings by seizing the books of merchants and publishing them to the world as rogues on his own authority. The exposure of respectable men to this sort of attack was of course a most dangerous and discreditable state of things, which all merchants had the strongest interest in abolishing, and against which they owed each other support and assistance. It was not to Mr. Claflin's credit that he did not take this view of the matter, and that he should have lent the moiety system his countenance; but then, all this does not render it a whit more likely that his house has been concerned in smuggling silk, and ought not to prejudice him pending a full legal investigation. When any man has conducted a business like his on so great a scale without reproach for so many years, the presumptions of the public ought to run, and run strongly, in his favor. The firm has asked, in a published card, for "a suspension of judgment," and they ought undoubtedly to have it, and have it unreservedly.

---

There have been of late more investigations into the state of things in the New York Custom-house, with a view to greater honesty, which Mr. Bristow would doubtless like to have, although the institution is said to be considerably improved since the old Murphy days. It is "investigated" and overhauled about once in four years, and great efforts are said to be put forth to make it efficient, but somehow they don't succeed, owing, we are usually told, to the wickedness of importers. If all importers were pious, God-fearing men, with a fondness for paying duties, we should have "the best Custom-house on this planet," and the Government would get its full revenues; but the importers being what they are, there is somehow a great deal of fraud and evasion, and the Government loses heavily. It is reported from Washington that the greatest difficulty the Treasury has to deal with is the finding of competent appraisers at the rate of pay which the Government offers. Clerks and detectives it is comparatively easy to secure, because their kind of labor is abundant; but a man with the knowledge of goods and the integrity competent appraisers need to have, can naturally command three or four times as large a salary in any of the dry-goods houses as the Government is willing to pay him. Consequently, the Government has to content itself with inferior men in that very department of the Custom-house in which the most important part of the work of preventing fraud has to be done. Now, when a Government does not wish to pay its officers high salaries, there is one well-known and widely-practised mode of getting good officers at low salaries, and that is by giving them permanence and social consideration in lieu of money. This succeeds in various countries, and is based on human nature. As long as our Government refuses either to give good wages or security of tenure, it must expect to be poorly served, and it may "investigate" weekly and "decapitate" monthly without mending matters. At present it seems to be waiting for the growth of virtue among the importers and distillers in order to set the Civil Service on its legs, but we can assure Mr. Bristow that importers and distillers improve very slowly.

---

A gentleman waked up in his bedroom in Brooklyn the other night to find a burglar taking his watch; he grappled with him, and the burglar thereupon shot him, as it seemed, fatally. The affair, which perhaps bears a close resemblance to the Nathan murder, is exciting a great deal of sensation, and there has been a determined effort made to catch the murderer. There can, of course,

be no harm in catching him, but there are several reasons why he should not be punished capitally or otherwise, which we shall now furnish. They are not original with us, and most of our readers will know where we have found them. It will do no good to hang him; men have been hanged for murder for ages, and yet, as we see, murders are committed. By parity of reasoning, it will do no good to imprison him; men have been imprisoned a great deal for murder and robbery, and yet they continue, as we see, to murder and rob. Neither capital nor any other punishment had really any terrors for this man when he was committing his crime, as any one may satisfy himself by asking him when he is caught. He will tell you he was not thinking of punishment at all, showing the absurdity of the talk we hear about "the deterrent effect of the gallows." Besides this, to hang him would only brutalize the other burglars, by familiarizing them with violent death. They frequently joke and laugh in full view of the scaffold; they laugh and joke, too, when passing by the jail, and even in their cells inside, showing the futility of our whole penal system. Though last not least, society, rather than the criminal, is responsible for his acts. If he had been well brought up, and had received a college education, and had had a moderate income when he graduated, he probably would never have stolen a cent. The moral of the story is that when men see a burglar taking their watches in their bedrooms, they should lie still and let him run, and thus avoid these sanguinary encounters.

---

The author of 'Ginx's Baby,' Mr. Edward Jenkins, to whom we refer again, not because we owe him any grudge, but because he is a good illustration of the kind of stuff out of which Sentimentalists like to make "statesmen" in our day, has again been laying down the law in London, this time on war and peace. Why the writing of 'Ginx's Baby' should give a man a right to speak authoritatively on questions of Continental politics it would be hard to say, but Mr. Jenkins evidently thinks it does. In a recent address he explained what it was which recently prevented, to use his own language, "the catastrophe of another European war." Most people believe that it was prevented by a combination of circumstances of considerable weight, such as doubts about the feeling of the German people, and about the sentiment of England and Italy, and, above all, by the opposition of Russia and Austria, and this conclusion is abundantly justified by all that has since transpired about the affair. But Mr. Jenkins knows more about it than anybody, and what he says is, that war was prevented mainly by "a simple circular sent from London pleading in behalf of truth, justice, peace, and Christianity" —or, in other words, a tract issued by the Peace Society which was sent around to European courts. "This result," he says, "would not have followed in olden times," which is quite true; but unhappily we have only Mr. Jenkins's word for any such "result" having followed in our times. To attempt to refute him would be labor wasted.

---

The report of the progress of the Old Catholic movement made to the annual meeting recently held at Bonn is not very encouraging. There are supposed to be 150 Old Catholic congregations in Germany, but only 100 gave any account of themselves. These have nearly 48,000 members, young and old, and 54 priests, and less than one-half of these are to be found in Prussia; most of the remainder are to be found in Baden and Bavaria. The bill, which we believe has just passed, giving Old Catholic congregations a share of the church funds proportioned to their numbers, will, it is expected, increase their numbers, but at most the increase must be slight. The reason is, as everybody knows, that in Germany, as in all other places, Catholics who dislike or despise the Pope will not in our day take the trouble to secede or form separate denominations. There is not faith enough in the country to form a new church. Dissenters simply become rationalists, and, instead of hiring a new clergyman, pass their Sundays at the beer-garden, and listen to music instead of sound doctrine. It is this which makes the position of old theologians like Dr. Döllinger so melancholy. "The bark is still there, but the waters are gone."

The Emma Mine has been again before the English courts, this time on the rendering of a decision by Vice-Chancellor Malins, on the petition of Mr. Askew, a stockholder, to have the Company wound up. The Vice-Chancellor at the first hearing directed the submission of the question to a meeting of the stockholders, which was duly held, and the majority of votes against the winding-up was in the proportion of ten to one, and the petition was therefore dismissed without costs. The history of the enterprise was again rehearsed at this last hearing, and with the same comic effect, produced by the contrast between what Park & Co. promised and what actually happened. The announcement of the prospectus that the dividends would be kept down to eighteen per cent. per annum until a fund of $900,000 had been accumulated, after which the whole profits were to be let loose monthly on the stockholders, is now greatly enjoyed by Englishmen. As Park lent the money for the last two dividends, it is supposed by those who do not know the man's stern, austere nature that he enjoys it too. The majority desire to keep the Company on foot partly in order to follow him up.

---

There has been talk of a reconciliation between the Italian Government and the Pope, but it seems to have only slender if any foundation. The Pope does not wish to be reconciled to any of his enemies, and is just now seriously troubled about the doings of the Freemasons, of whom both he and the Church press seem to have very comical ideas, evidently considering the order the very fountain of the most prominent forms of modern wickedness. Most of the Catholic powers are said to be busily occupied with preparations for the conclave which is to elect the Pope's successor, either making themselves acquainted with their own powers and privileges, or trying to make out how the thing is likely to go; but Italian aims are said to be confined to getting an Italian elected—and that an Italian will be elected there seems to be little doubt—and the Government postpones the work of reconciliation until he appears. There is too little chance of accommodation with Pius IX. to make it worth while to torment him with proposals or negotiations. In the meantime, the policy of the Ministry towards the Church has been the subject of a brilliant debate in the Parliament, ending in the triumph of the Government by a majority of 70. The charge brought by the Opposition, led by Mancini, was that the Ministry had been guilty of illegal and impolitic concessions to the bishops and clergy, and he moved that the Ministry be requested to keep inviolate the national dignity and the laws already in force, and to guard the rights of the state and the prerogatives of the civil power as set forth in the law of the 13th May, 1871, and to propose without delay "the redistribution of ecclesiastical property, on the basis of the liberty of the inferior clergy and laity in matters ecclesiastical."

---

The bills presented to the French Assembly on "Public Powers" by the Ministry simply fill up some gaps in the working machinery of the new constitution. One gives the President the power of convening the Chambers in extraordinary session and of proroguing them, and he is bound to call for an extraordinary session if requested to do so by a majority of each Chamber. He is to have also a modified veto, which consists in the power of insisting on the reconsideration of a bill to which he objects. It may, however, be passed a second time by a simple majority. The impeaching powers of the legislature it is proposed to make the same as under the American Constitution, and both houses are to have the right of going into secret session. The other bill regulates the election of the Senate. It was the refusal of the Assembly to refer these bills to the Committee of Thirty which caused a majority of that body to resign, but this only made the Assembly laugh. The Committee was looked on as one of the weapons of the old "policy of combat," which is out of place now that conciliation is the order of the day. As reorganized, it is completely changed in its character, the Left being in a majority on it.

## BUNKER HILL.

THE way in which most good beyond the stimulation of mere emotion is to be got out of the contemplation of great historic events, is not so much by wondering over the consequences which have flowed from them, as by trying to put one's self in the place of the actors in them, and to see the world through their eyes. This is about the most useful exercise in which a student of history can engage, and on great anniversaries we are all students of history. What we are most apt to do, however, is to please ourselves with fancying that the men of other days saw the world as we see it, and were sustained in their trials by *our* hopes and aspirations, and that whatever we have accomplished since their time is a simple fulfilling of their ideal. One unfortunate result of this practice is, that those who indulge in it are apt to learn little or nothing from the lives of their forefathers, and, in fact, get into the way of looking at them with a certain patronizing pity, as one looks on one's own boyhood. Many a man is parading at Bunker Hill to-day with a sort of ill-disguised belief that it is a greater thing to be a voter or politician in the Republic which Bunker Hill helped to set up, than to have watched all night in the redoubt, and to have fought in it in the morning; and that what its defenders were trying to do in a blind way was what this generation has done.

But this does not do the men either of the Revolutionary or of the ante-Revolutionary days justice or anything like justice. There has been no pioneering in our day half so hard as their pioneering. No man who has pushed into the wilderness with the United States behind him, and all the hope and pride of its citizenship in his heart, has ever displayed anything like the fortitude of the men who settled the Connecticut Valley with nothing but a feeble colony at their back, and separated from all the great forces of historic civilization by what was to them a vast and impassable ocean, beyond which the elect struggled hopelessly against pope and king. There has been no fighting in our day which expressed a tithe of the courage expressed by the fighting of those volunteers who, without any recognized political organization to support them, without general, officers, or commissariat, and with the blackest uncertainty about the future, lined the intrenchment at Bunker's Hill a hundred years ago to-day. Our modern soldier, with his bounties and his pensions, his major-generals and his brigadiers, his military schools, his quartermasters, his arsenals, his sanitary-commissioners, his hospital nurses, his great government, his national flag, his flood of sympathy and of prayer borne in on him by steam and electricity at every hour of the day and night, and with the eyes of the world on him every time he loads his musket, has never had need of the store of austere faith and passionate valor which enabled the Puritan farmers to stand their ground as steadily as if they were commanded by Turenne, and Louvois was behind them with the resources of a great kingdom.

The secret of their confidence, and of their resulting success, was never so well worth studying as at the present moment, for it contains a political lesson of vast importance. What would come of their fighting the men who began the Revolution had no definite idea, and could have had none, any more than their great-grandfathers when they rose against Charles. It is very certain that they had no distinct political or social aim in their heads. They did not suppose for one moment that anything they could say or do would bring on the New Jerusalem one day sooner, or would hasten the reign of universal brotherhood or "free religion," or perform any process of final cleansing of the human heart. Any modern reformer who fancies himself their spiritual offspring might well take a lesson from them in modesty of outlook. And yet their strength lay in what Cromwell said, little over a century earlier, the strength of his Ironsides lay, in "knowing what they were fighting for, and loving what they knew." They neither dreamed dreams nor saw visions. They looked for no model state as the result of their sacrifices, but they felt, as their fathers felt, that they had in their keeping certain great political traditions of their race which their ancestors had transmitted to them, which they owed to their descendants, and which were well worth dying for, not as things which would end the reign of Satan, but which would make human struggles with the ills of a hard and trying life worthier of what they believed man's nature and destiny to be. They did not know what government, if any, would succeed the one they were resisting; but they knew that taxes ought to be voted by taxpayers, and that taxpayers ought to see to the spending of them; that justice should neither be sold, denied, nor delayed; and that any society in which they themselves lived ought to be ruled by law and not by men.

It was this perfect definiteness of perception as to what they were defending that enabled them to trouble themselves so little about the future. They had got, they knew, the foundations of Anglo-Saxon government behind their breastworks; how the legislature should be composed, or who should be governor, were, they felt, questions of detail. And these foundations were not newly-hatched theories evolved from the breasts of social or political philosophers, and amended from time to time in conventicles and essays; they were principles which ten generations had lived by and suffered for, and which had come over the sea with them. The misfortune of many of those who in our day are trying to carry out in civil life the doctrines for which they believed their fathers died on the field, is that, most of the time, they not only do not know what they are fighting for, but they glory in their ignorance. That the past has given them anything worth defending they think exceedingly doubtful, and they strenuously avoid forming any definite idea of what the future has in store. In most of their dreams it is a sort of fool's paradise, in which the difficulties by which, in our own day, human progress is beset will be got rid of by some occult force, of which "love" is the nearest description they give us; in which all the troublesome details of human activity will be settled by a general spirit of cheerfulness and forbearance, stimulated by occasional cheers and *feux de joie*. If society is really to be carried forward so as to keep alive the only fruitful activity—that which comes from rational hopefulness—reformers must clear their heads of cant, and find out exactly what they want before they shoulder their arms. The practice of enveloping all the problems of our time in a mist of vague declamatory aspiration, and of avoiding distinct definitions as signs of coldness or over-criticism, has in it the seeds of tremendous despair.

## THE REVIVAL IN ENGLAND.

THE large and increasing share of popular attention which religious questions have been attracting in England for the last ten years, has been the most striking phenomenon of English politics. We say of English politics, because religious questions are, in all countries in which there is an established church, political questions also, and among the most exciting of political questions, and the Established Church of England is perhaps the most famous and important institution of its kind the modern world has seen, because it is the only institution of its kind which can be called thoroughly national in its history and constitution. It has still a strong representation in the national legislature; it has until recently had complete possession of the leading universities; it has its ministers in every parish so lodged and endowed as to make them the most respected and picturesque and influential features in English country-life, and it has had, and still has, the undivided affection of the most cultivated and powerful classes of English society. Almost every man of note or consideration has been baptized or married in it, and is bound to it by the strongest ties of interest or affection, and the most splendid monuments of the national architecture are in its keeping. In fact, there never was a church whose foundations were laid so deep in the soil, or which was so buttressed both by tradition and custom. It is long since anything like a majority of the population worshipped within its walls, and yet it cannot be said that its connection with the state has thus far been seriously threatened by the numerical preponderance of Dissent. What threatens it, or has seemed to threaten it, is the growth of rationalistic opinions, and it is largely due to their bear-

ing on its fate that the theological debates attract so much more attention in England than anywhere else. It is only in England that the rationalists can be said to be at this moment at all fanatical or propagandist in their temper, or to feel the public proclamation of their infidelity to be a solemn duty. In every other modern country cultivated unbelievers are content to be let alone, and would smile at the notion that unbelief needed apostles or missionaries. The English Positivists have apparently satisfied themselves that silence is at least base, and that everybody who does not go to church is bound to let the world know why he stays at home, or incur the guilt of "compromise," which appears to be the Positivist name for sin. There can be little doubt that this falling-off is a result of the immense social influence of the Church Establishment, and that it is the worldly advantages of adhesion to it which has in England elevated negation into the rank of a new gospel. The imposing position of the Church, too, gives an air of keen political interest to many questions which in other countries would have little interest for anybody but Churchmen, and raises into importance things which in other countries would attract little attention from anybody at all. Whether a Wesleyan minister may lawfully put the word "Rev." before his own name on his daughter's tombstone is at this moment being solemnly argued by counsel before an English court, and it is not very long since English society was thrilled by hearing that Max Müller was going to deliver a lecture on missions in Westminster Abbey—the fact being that Westminster Abbey is a poor place to lecture in, and that Max Müller has nothing particular to say about missions; but then he is a kind of sceptic, and Westminster Abbey is a church.

The press—not the religious, but the daily and weekly political press—are now discussing, as an important social question, the condition of the art of preaching among the clergy of the Established Church, apropos of the assertion recently made that a large number of the younger ministers buy their sermons lithographed at a low rate from hacks in London, who, having once entangled them in their coils, levy blackmail on them by threats of exposure. This, combined with a letter of the Archbishop of Canterbury on the Moody and Sankey revivals, in which he concedes to these gentlemen great success in rousing sinners from their apathy, but claims for the regular clergy "the delicate and difficult task of ministering to anxious souls," has brought up the enquiry, which is destined before long to make its way to the front in all Protestant countries, whether the art of preaching is one that can be taught at all, or whether the attempt to teach it has not much to do with the declining power of the sermon, as compared to other moral and religious influences, for that it is relatively declining nobody denies.

Ministers are trained for the work in all countries on one of two theories: either that they are to be made, at ordination, the recipients of a certain mystic grace, which qualifies them exclusively for the administration of the sacraments, or that there exists a science called theology, the knowledge of which can be communicated, and is necessary to a teacher of religion. In the Catholic Church a theologian is a man who is familiar with the opinions of other sound theologians, with the authoritative utterances of the Church on the various questions of doctrine and discipline. In the Protestant Church, he is a man who is not only familiar with the writings of the theologians of his and other schools, but has a certain skill of his own in the interpretation of Scripture. Under the first theory, preaching is of course of comparatively little consequence. Under the second, a good preacher has of necessity to be a good theologian, and in making a man a good theologian you do most of the work of making him a good preacher. But as the popular interest in dogmas has declined, and as theological definitions have lost their clearness, a young man who leaves college well versed in theology is no longer as well equipped for the work of preaching as he used to be. To put the matter in another way, the technical point of a minister's training has not the value it once had. He needs now, in order to reach "the sinner," not so much hermeneutical skill or dialectical acuteness, as something else which no college can give him, and which books do not yield—a wide experience of life, and its trials and problems. Any one in our days who undertakes the task of religious exhortation must be able to say, in order to succeed, not simply that he has read or thought much, but also that he has suffered and seen much. Of purely official consolers or guides the world is well-nigh tired, and the number of honest men who are willing to appear in any such character every day declines. The successful preachers are therefore more and more those who not only have fluency of expression and vividness of imagination, but to whom years have brought the usual share of human burdens and anxieties. No art can make the talk of a man about sorrows he has not felt, perplexities in which he has never been plunged, and joys which he has never known, from seeming shallow and perfunctory; and it is with sorrows and perplexities and joys, rather than with opinions or propositions, that preachers have now to concern themselves. It must be added, too, that in so far as a minister has to be a casuist he is worse off now than he used to be, because casuistry is harder to teach, owing to the greater complexity of life, and the greater range of experience needed to enable a man to see clearly through what may be called the *mêlée* of conflicting rights and duties by which the simplest and humblest career is now surrounded.

The general result is that the regular clergy in England find their office perhaps more endangered by the labors of volunteers than it ever was before, far more than in the days of Wesley. When the Archbishop acknowledges the awakening power of the two American revivalists, he is not likely to secure much heed for his reservation of the subsequent work of counsel to the ordained ministers, and any admission from such a quarter that a really fruitful religious awakening can be carried on to the end without their aid has in England political as well as religious significance. It is most likely, too, that the enormous success of this movement, which seems to stir the highest as well as the lowest circles, will have its effect in convincing the rationalists both in church and state of the width of the interval which still separates the bulk of any community from anything like a real acceptance of the negative position with regard to the great problems of life and death. The philosophers may demolish the popular belief to their full satisfaction, and yet find again and again that the cares and sorrows of life have far more power in strengthening faith than logic in overthrowing it.

## JOSEPH WINLOCK.

DIED JUNE 11, 1875.

SHY soul and stalwart, man of patient will
Through years one hair's-breadth on our Dark to gain,
Who, from the stars he studied not in vain,
Had learned their secret to be strong and still,
Careless of fames that earth's tin trumpets fill;
Born under Leo, broad of build and brain,
He watched while others slept, in that hushed fane
Of Science, only witness of his skill:
Sudden as falls a shooting-star he fell,
But inextinguishable his luminous trace
In mind and heart of all that knew him well.
Happy man's doom! To him the fates were known
Of orbs dim-hovering on the skirts of space,
Unprescient, through God's mercy, of his own!

J. R. L.

## WHO ARE OUR ANCESTORS?

THE principles of heredity established by modern inductions in biology tell against the barbaric traditions of law and heraldry and for the rights of women, so far, at least, as the influences of strictly inherited qualities, both mental and physical, go towards determining our natures—namely, for the equal right of women to be counted among our ancestors. The likelihood in the average of a grandson's resembling his maternal grandfather in any quality is as great as that of resembling the paternal one; and a granddaughter is as likely to resemble in any quality her paternal grandmother as the maternal one. This law, which appears rather by the failure of the various fanciful hypotheses held on the subject of heredity than by positive

evidence sought for it, is on this very account the better founded in accordance with the canons of induction—namely, by the method of difference, or the absence of exceptions, taken together with the positive evidence for heredity generally. But this law does not imply that there is any tendency of one sex to transmit to the other any proper qualities of its own, except in that latent state which the law essentially implies, and which, as a mode of transmission, is one of the most important inductions in biological science, having various illustrations and applications.

Nearly all laws of heredity are properly laws of averages, against which, of course, evidences may be massed by a partial or one-sided induction. They can in general be held to be true only as governing averages ; or at best as being laws of such real tendencies as mask and modify and even countervail one another. Such real tendencies have been made out by the more philosophical observers, like Dr. Lucas, through the judicious choice of subjects for investigation least likely to be affected by chance or training—*e.g.*, rarely-occurring physiological peculiarities. Some special laws have thus been made out, such as the tendency of transmission to the same sex of individual characters or peculiarities first appearing in one, though otherwise they have no special relation to sex ; and on the other hand, the more general secular, slowly-acting, and weaker tendency of transmission to both sexes of qualities, or degrees of qualities. which originally belong to one. This tendency is shown only in connection with the tendency to inherit acquired qualities at earlier and earlier ages, or periods of life, and therefore in a manner independent of adult sex development. The causes which keep the sexes different are, however, much more powerful than this tendency, which is apparently operative only where qualities so transmitted have ceased to be of special sexual importance, or have lost, as they readily might in this case, their original association with sex.

Individual prepotency, again, or the preponderance of influence upon offspring of one parent over the other ; the absence of perfect equality of influence in all respects, or the accidental inequality of influence, which may be said to be the most invariable fact of heredity, masks and confuses all other laws, whether of averages or of real tendencies. But this prepotency does not appear to belong to one sex more than to the other ; so that the rule holds that in the long run the two sexes are of equal influence in transmitting individual or family characteristics, so far as these are independent of the influences of education and family traditions ; and it should be especially noted that characteristics associated with sex are transmitted *latently*, though none the less really, through the sex in which they do not appear. The very large part, however, which education has to play in human development—in the election and fostering of hereditary tendencies—is another masking and confusing cause, which may account in great measure for traditional and popular notions about descent, but does not really interfere with certain general conclusions in answer to the question, Who and how many are our real ancestors, or those who have determined our really inborn natures ? We are quite ready to agree with those who cry, "Great is education !" This power is, indeed, the scientific foundation of law and moral responsibility ; but heredity is also great, and even adds to, we believe, instead of diminishing, the true grounds of social institutions, the rights of law and punishment.

The importance of heredity leads to the rather startling consequence from the equality of the sexes in determining descent (exhibiting the rôle which sexual generation takes in the phenomena of organic life generally), that all living beings, both animals and plants, of races in which sexual generation is the prevailing mode of reproduction, derive their natures on the average from every productive individual of only a few generations back whose descendants have survived within their race or biological province. The true genealogical tree of science branches backwards—a cause of great difficulty and annoyance to the genealogist. When we take account of strictly inherited natures and variations of natures, setting aside the conventions of names and the traditions of external inheritance, we are led by the rule of the equal transmission of inborn qualities by both sexes to search for our origin through two parents and four grandparents, to eight great-grandparents (or six if one's parents are first-cousins), and sixteen potential great-great-grandparents. And our "gret-gran'thers multiplied by three" would, with their equal spouses, make thirty-two. We call these "potential" ancestors of the fifth degree, since, on account of the intermarriages of relatives within permitted grades of consanguinity, even the sixteen possible ancestors of the fourth degree may be condensed, so to speak, to the lesser number even of eight. Such reticulation or interlacing of branches in the back-reaching lines of ancestry through which one may arrive by several paths to the same individual ancestor (who, therefore, fills the place of several potential ancestors), becomes more and more frequent, and ultimately, or in the long run, a predominant feature of the natural genealogical tree ; for it takes but twenty generations or about five hundred years to reach a generation with more than a million potential ancestors in it, or one which can be reached through more than a million various lines of ancestry. We call two lines different, even though they may coincide in all but small portions of their courses.

It is in a high degree probable in the average case that a few thousand individuals have filled the larger number of these million places, since true races, even of men, are usually confined to narrow provinces. An insular position like that of Iceland is not the only kind of isolation in a race which would make any one of the present generation a descendant by so many thousands of lines (on the average) from every productive individual of twenty generations ago, as almost certainly to make every such individual, who has any living descendants at all, an ancestor of *all* now living in the province of his race. The agricultural peoples of the counties of England appear to be thus isolated in great measure, so that of a few thousands, five hundred years ago, each would be an ancestor of almost all living at the present time in his county. But neither such provincial limitations of a race, nor any but the most rigid caste interdictions of marriage, would prevent an English lord's being the descendant of a very large number of peasants of five hundred years ago, since the interdicted marriages are not between absolutely separated castes, and alliances descend by small grades in the social scale, without scandal, through collateral lines, in the course of a few generations, from the noble to the serf ; and ascend by the same grades.

The case of Iceland affords an instructive illustration of the remarkable effect of the biological principle of bi-sexual generation, namely, that in a comparatively short, almost insignificant, period in the duration of a race, even the most advanced has the solidarity of a zoöphyte. Iceland has been occupied for about thirty-eight generations by a nearly fixed population of fifty thousand—an isolated race of Scandinavians. The number of potential ancestors which any one has of the thirty-eighth degree is about two hundred and seventy-five thousand millions. All these were represented in the case of the present Icelanders by fifty thousand emigrants ; so that on the average each emigrant filled the places of five and a half millions potential ancestors, or could be reached on the average by this number of partially differing reticulate lines of descent. If we reckon the average duration of human life at a third of a century, the condensation on the whole has been from five hundred and fifty thousand million possible ancestors of all degrees, to the thirty-eighth inclusive, down to the one million four hundred thousand who have actually lived in the island, or to one in three hundred and ninety-three thousand of potential ancestors. It is thus made almost certain that every original emigrant to this island who has any present descendants at all is an ancestor of all now living. A doubt of this conclusion arises, however, from the circumstance that the inhabitants have been more or less divided into isolated provinces ; but if occasional intermarriages between members of different provinces have amounted to one in ten thousand marriages, a connection through these of every present inhabitant with all the original settlers would be in a very high degree probable.

Common qualities in the Icelander distinguishing him from others of the Scandinavian races, such as travellers have noticed, and especially physiological ones like that early noted by Sir Henry Holland (of a superior stature in the Icelandic men, due mainly to the greater lengths of their spinal column) would not necessarily require the supposition of a close intermixture of the race to account for it, unless it be an instance of that morphological variation to which limited races are more subject than extensive ones. But such a physiological character is more likely to be the direct common consequence of similar conditions, exercises, and modes of life, and of their inherited effects, than of the mere drifting of morphological variation on one hand, or the survival of characters from the advantages of them in the struggle for existence. The human struggle usually depends, or has come to depend, on other than merely bodily or athletic grounds of advantage. Intelligence and strength in union or brotherhood have long been the vantage-grounds of the human contest in the competition of race with race, or tribe with tribe, and in opposition to unfavorable external conditions. And biology affords a proof, in the natural genealogical tree, of the merely natural brotherhood of men quite as impressive as the theological derivation of the race from a single pair ; but does not make so complete and emphatic a reference back to one concentrated responsibility for human weaknesses and sins. How great this becomes on the theological theory can also be estimated by the above mathematical reasoning. Thus, if the degree of relationship of any ancestor to a descendant be represented by the number of places of potential ancestors of his degree occupied by him, compared to the whole number of that degree, then the relationship of each parent to their offspring would

be one-half ; that of each grandparent one-quarter ; of each great-grandparent one-eighth ; except from the marriage of first-cousins, which would make a pair of the eight fill two-eighths each, or one-quarter, or be of the same degree as grandparents ; and if in any remote generation a single pair could have filled all the places of the potential ancestors of that generation, their relationship to all their descendants would be of the same degree as that of immediate parents ; so that though the number of potential ancestors of the generation of the estimated time of Adam would be a number requiring more than seventy numeral figures to express it, yet with all these concentrated, as was possible, in a single pair, this pair comes to have the proximity of relationship to us of immediate parents. Such ancestors as Adam and Eve would therefore be nearer relatives to us than our grandparents.

A recent newspaper correspondence has discussed the statement that the Roman Princess Torlonia, though of a family which became prominent only eight centuries ago, was yet the descendant of a thousand Colonnas. The thirty-two generations which may be assumed for this period would give the princess about eighty-six hundred millions of potential ancestors in all. This number, which would of course in any case be greatly reduced by the intermarriage of remote relatives, might easily include among its representatives many thousands of persons bearing this family name, but would doubtless also be represented by many more thousands of persons as humble in name and origin as the Colonnas were eight centuries ago.

## PORT DARWIN.

MELBOURNE, March 24.

AUSTRALIA is just recovering from the horror of a shipwreck which would pass almost unnoticed in a larger community, but is a great event here, and affects many families in the colonies. On the 24th of last February, as the steamship *Gothenburg* was returning from the Northern Territory by the ordinary route round the east coast of the continent, her crew observed that the sea, which had been very rough, became suddenly smooth. The warning was disregarded, and in a few minutes the ship struck at full speed upon a coral reef, landing herself about three parts of her length. At first it was believed that she could be floated off, and no proper care was taken to launch the boats. But a storm came on, and the ship listed over and broke up so suddenly that only a few altogether escaped (22 out of 125), and most of them by righting a boat which had been upset. But for the accident that one party fell in with a steamer in waters where ships of any kind are very scarce, it is probable that no one would have been saved. A South Australian judge, Mr. Wearing, was among the drowned, and is universally regretted as a man of high social qualities and great professional ability. Two other lawyers perished with him, and two or three other professional men. Most of the passengers, however, were lucky gold-diggers.

The disaster calls attention to the new settlement on the northern coast, which is rapidly rising into importance. Some dozen years ago, the British Government handed over all that part of Australia which lies north of the 26th degree of latitude and between the 129th and 141st parallels of longitude to the colony of South Australia. There was some reason for the gift. South Australian energy had explored the whole distance up to the Indian Sea, and the South Australian boundary presented the nearest approach to settlement. Still, there are grave reasons for questioning how far it was wise in the Home Government to offer the grant or in the Colonial to accept it. The Northern Territory has to be settled from the coast. It is true that a colonial enterprise has lately connected it with a telegraph from Adelaide; that the Adelaide postmaster drove across the continent in a buggy, traversing what our maps used to call the great Australian desert ; and that a few stock-owners have since taken sheep and cattle across by the line of telegraph. Still, when I tell you that only 100 miles of road have been made between Adelaide and Port Darwin, a distance of 1,600 miles, you will understand that the journey by land is not often attempted. Nor is a road across likely to be soon made. A company of a highly speculative kind was indeed started two years ago, which proposed to construct an elevated railway, and demanded in return a grant of forty million acres ! But no amount of log-rolling would carry such a scheme through the Legislative Assembly. At present, the more we know of the interior, the more certain does it seem to be that it consists entirely of patches of desert and patches of pastoral country, without corn-land, forests, rivers, or mines ; in fact, with none of the features that invite settlement. Still, South Australia cannot neglect its costly dependency, and is rather in the position of a child having to carry about a baby half as big as itself ; for it is but a small colony of some 200,000 people, mostly interested in corn, wool, copper, or wine, and with but the faintest sprinkling of a mercantile community. It has made many blunders, but has done much good work ; and, after one very costly failure to occupy and survey the territory, has at last established a government and order of a kind. Its success has been mainly due to exaggerated reports of the mineral wealth of the territory. It is over three years since South Australia was filled with rumors that gold was so plentiful in the North that the men pitching the telegraph poles were forbidden to carry away any of the earth they disturbed. So prevalent was this report that employers began to apprehend a general stampede of workingmen, and I believe we were only saved from a very large emigration by the impossibility of procuring transport. But two or three thousand men, chiefly miners, did actually go North to explore. A period of bubble companies and stock-jobbing succeeded in due course, and this was followed by the inevitable collapse. The truth is now known to be that the country is auriferous, but that there is no alluvial gold, and that large capital will be required to work the quartz reefs. Still, a gold-bearing country, with large rivers and easy communication with India and Batavia, is not likely to remain long without a population.

The question now comes whether a rich strip of territory on the Northern coast of our continent ought to be governed by the legislature of a small colony whose nearest town of 5,000 inhabitants is 1,500 miles distant. And the wreck of the *Gothenburg* has brought up this question again, for three of the lives lost in that shipwreck were sacrificed to the supposed necessity of sending up a Judge of the Supreme Court, with an associate and a Crown prosecutor, to try a Chinaman guilty of burglary, who, as it turned out, had escaped before the Judge arrived. Of course, this particular difficulty might be, and soon will be, partially met by the appointment of a resident Judge ; but even then there will be constant appeals to the court in Adelaide. Nor are matters of law the only ones that demand prompt settlement. It is a question whether Port Darwin is the best site for a capital ; it is a question how the gold reefs ought to be leased ; and here, as in every part of Australia, our waste lands are a political trouble, and are contended for by two classes—the sheep-farmer who rents, and the corn-farmer who buys. It might be an extreme measure to equip a population of two or three thousand with all the paraphernalia of a constitution, especially as the Home Government would undoubtedly insist on the two Houses of Parliament. But it is a question, I think, whether the territory would not be better administered as a Crown colony by a Governor and a small council. The present arrangement is evidence of that curious sense of incapacity to govern which has succeeded to the old arrogant, doctrinaire tone of Downing Street. But Adelaide is not more enlightened or more disinterested than London, and practically is very little nearer to the governed territory ; and the present arrangement only serves to retard settlement and produce political complications.

I regard this question of the Northern Territory as one of the highest importance for all Australia, for a reason which Americans will understand. The climate of the Northern Territory is sub-tropical, and it is a question how far men of British extraction can labor in it. I have questioned several who have been there, and can get no conclusive answer, but am inclined to believe that it is a trying climate, bearable by young men, but not by those who have passed middle age. Partly for this reason, and partly to escape the high wages demanded by Europeans, the capitalists interested in opening up the territory are trying to import Coolies and Lascars in such numbers as to swamp the whites. I have little doubt they will succeed. The Governor of South Australia, Mr. Musgrave, is a man of sense and good feeling, thoroughly opposed to slavery under any name or in any form. But he has little power to interfere, and perhaps does not sufficiently exert what power he has. The employers will carry the day against him, if, indeed, they may not be said to have done so, for several ship-loads of Coolies have arrived. It is possible that the white men, who are not very numerous in the North, will quickly recede before their colored rivals. In that case, Australia will have nothing worse to complain of than an Asiatic colony in one part of the continent. But it is possible, also, that the whites will live on side by side with the colored men, taking the lighter employments for themselves, leaving the Asiatics to hew wood and draw water, and contracting a patrician scorn for manual labor as fit only for "niggers." In that case, the prospect is not a reassuring one, for an arrangement found to work profitably and pleasantly at Port Darwin, and which has partially invaded Queensland, may easily overspread a large part of a continent in which the coldest climate is as genial as the south of France. I do not suppose I shall live to see slavery or a war of races myself, but I fear there is some danger for the next generation if the Northern Territory continues to be administered by a distant government, with no check of public opinion, and with no object except to achieve good financial results.

# Correspondence.

## THE ORIGINALITY OF PROFESSOR ADAMS'S WORKS.

To the Editor of the Nation:

Sir: To the communication of "M. G." respecting "certain coincidences" in my recent work on 'Democracy and Monarchy in France' "which need explanation" I reply as follows:

1. The coincident passages from Buckle and from myself relating to Helvetius are an account of the argument of the philosopher, given, as far as possible, in the language of the philosopher himself. The first chapter of 'De l'Esprit' is entitled "Exposition des Principes," and is a kind of abridgment of the whole work. This was used by both Buckle and myself (as our references show); and that our language should correspond is no more strange than that two reporters should use the same expressions in reporting or abstracting the same speech. In very many instances, and in all the passages that are strikingly alike, we have simply translated the original. A single example will be enough to show that neither Buckle nor myself wandered very far from the author we were giving an account of. Helvetius, after stating that we have but two faculties, that we have these in common with animals, and that we are superior to animals solely by reason of "*une certaine organisation extérieure*," uses these words:

"Si la nature, au lieu de mains et de doigts flexibles, eût terminé nos poignets par un pied de cheval, qui doute que les hommes sans arts, sans habitations, sans défense contre les animaux, tout occupés du soin de pourvoir à leur nourriture et d'éviter les bêtes féroces, ne fussent encore errants dans les forêts comme des troupeaux fugitifs?" (p. 2).

This is the basis of my sentence:

"That if Nature, instead of giving us hands and flexible joints, had terminated our limbs with hoofs like those of a horse, we should have remained wanderers on the earth, chiefly anxious to find our needful supply of food and to protect ourselves against the attacks of wild beasts" (p. 41).

And of Buckle's:

"That if, for example, our wrists, instead of ending with hands, and flexible fingers, had merely ended like a horse's foot, we should have always remained as wanderers on the face of the earth, ignorant of every art, entirely defenceless, and having no other concern but to avoid the attacks of wild beasts, and find the needful supply of our daily food" (p. 621).

The other coincident passages cited by "M. G." might be shown to have had a similar origin, but space will not allow it; and therefore I can only refer, for proof of the statement, to the volume itself and its foot-notes.

It is evident that my assailant desires to convey the impression that I have used Buckle and the quotations given by him as my authority. To this the answer is that an inspection of our works will show that we used different editions of Helvetius, Buckle using 'De l'Esprit' (Amsterdam, 1759, 2 vols.), I using 'Œuvres Complètes de Helvetius' (London, 1781, 2 vols.) By comparison I find that Buckle, in his notes, has made nine quotations from his author, and that I have made eight; also that of the eight passages quoted by myself, three only are quoted by Buckle. In other words, in giving an account of a philosophical theory as chiefly embodied in a single chapter of eight pages, both of us together have given fourteen different quotations, six of which are given by Buckle alone, five of which are given by myself alone, and three of which are given by us both in common.

2. As to the correspondence of quotations from other authors, this is to be said. In preparing the chapter on the "Philosophers of the Revolution" I not only examined the works of the four philosophers reviewed, but I also examined (importing a large number of volumes for that especial purpose) the works of all such contemporary and subsequent authors as I thought would throw light on their influence. When Buckle was first published in America I read him with care, taking copious notes on the authorities to which he refers. These citations with others I have freely used in collecting my library and in my subsequent researches. From the great mass of notes thus accumulated, I used in the composition of the chapter referred to such sayings and anecdotes as in my opinion would best illustrate the influence I was trying to show. That the same and a host of others are to be found in Buckle is doubtless owing to the fact that he was trying to show the influence of the same writers, though for quite another purpose. Whether these facts show any improper indebtedness to Buckle, I leave to others to judge.

3. The next article in the indictment is that, "after disposing of Helvetius, Mr. Adams makes up his notice of Condorcet in precisely the same manner." Presuming that this is a typographical error for Condillac (as Condorcet is not mentioned in the volume), I reply that I have made just four quotations from Condillac, and that not a single one of them is to be found in Buckle. Moreover, my references are all to the ten-volume edition of Condillac's complete works, while Buckle's are all to a two-volume edition.

4. "From his examination of philosophical theories," says "M. G.," "Buckle proceeds to consider the influence these exercised on the spread of physical science. Mr. Adams does the same, but he mentions not a name nor a fact that is not contained in Buckle."

This statement shows either great carelessness or great disingenuousness. Buckle devotes thirty solid pages (627-657) to his exposition; I, a single paragraph (p. 49) to mine. Buckle's was intended as a most exhaustive summary of all that was done for science by the writers referred to; mine was merely a qualifying paragraph thrown in to prepare the way for the political discussion that follows. That every "fact and name," therefore, contained in mine should be found in Buckle is certainly no marvel. They are also all found in Whewell, and I doubt not in every writer on the history of science.

5. "Remarks about him [Rousseau] by Bonaparte, Hume, Lord Holland, Pathay, etc., are quoted. They are all given in Buckle, p. 767."

This statement will appear in its true light when the following facts are considered. On turning to Buckle, I see that he has referred to nineteen different authors; on referring to 'Democracy and Monarchy' (pp. 76–79), I find that I have referred to thirteen. Now, of these thirteen five only are quoted by Buckle. I have given "remarks about him" (*i.e.*, Rousseau) by Lessing, Herder, Kant, Schiller, Goethe, Carlyle, and Maine, to none of whom (save to Goethe, and that for a remark different from mine) does Buckle refer. Yet "M. G." declares "they are all given in Buckle"!!

6. In respect to the passage cited from De Tocqueville, I have only a word to say. That I used the book very freely is shown by my numerous quotations and references. Concerning the intellectual genesis of the figure and the comparison contained in the two quotations I have no recollection. My presumption is, that having read the passage in De Tocqueville, I afterwards reproduced the comparison and the figure without thinking of the source from which they had come into my mind. I believe it is admitted that there is such a thing as "unconscious memory"; at any rate, this explanation must go for what it is worth.

7. In speaking of the chapter on "The Rise of Napoleonism," and its original appearance in the *North American Review*, my assailant remarks: "There are various kinds of reviews, all equally legitimate, providing only that in writing one kind the reviewer does not pretend to give another"—which is to say, the article professed to be what it was not. This conclusion was reached after the declaration that it "was first printed as a review of Lanfrey and other works." To which I respond as follows: The article was *not* printed as "a review of Lanfrey and other works," but simply as an essay on the subject embodied in its title. If it could be said to "pretend" to be anything, it was an account of "The Rise of Napoleonism," as revealed by the most recent and most trustworthy authorities; certainly, it never pretended to be anything else. At the head of the article stood, in accordance with a well-known habit of the quarterlies, what I believed to be the most important of such authorities. Of these, Lanfrey was placed first, simply because his is the great—indeed, the *only*—history of the period written since the publication of the 'Letters and Despatches of the First Napoleon.' The book was used, therefore, not to be reviewed, but as a great source of information—indeed, just as Macaulay used Nugent's 'Memorials' and Thackeray's 'Life of Pitt' in preparing his famous essays on Hampden and Chatham. As the essay was largely narrative, not to have made free use of Lanfrey would have been utterly inexcusable; to have made dishonest use of him, and then to have invited attention to my dishonesty by constantly quoting and referring to him as I do, would have been simply to advertise myself gratuitously not only as a literary trickster, but as a literary fool. The book was constantly followed, but original authorities were just as constantly consulted.

8. "Not even Mr. Adams's title is original, for about three years ago Mr. H. Reeve published 'Royal and Republican France,' a work of precisely the same character."

To the momentous charge embodied in this paragraph I plead not guilty, though unfortunately I have only my word to place in opposition to that of my assailant. I cannot, however, allow the distinguished friend and translator of De Tocqueville, "Mr. H. Reeve," to lie under the imputation of having produced a work of "precisely the same character" as the one to which "M. G." has given his attention. I have not had the pleasure of reading the handsome volumes of Mr. Reeve, but on turning them over in a book-store I see that they are made up of the essays on French subjects with which for the last thirty years he has enriched the English quarterlies. I seriously fear, therefore, that the only similarity between my book and his is in their titles—and in the imagination of "M. G."—Very truly yours,

C. K. Adams.

Ann Arbor, June 12, 1875.

# Notes.

THE twenty-fourth meeting of the American Association for the Advancement of Science will be held at Detroit on Wednesday, Aug. 11. Within the past fortnight has appeared the volume of Proceedings at the meeting held last year at Hartford. It contains the address of the President, Professor Lovering, the reports of committees, and a large number of interesting and valuable papers (Salem, Mass., published by the permanent secretary, F. W. Putnam).——An exhibition of Revolutionary relics has been opened in Boston for this week under the best auspices. It takes advantage of the attraction of the Bunker Hill celebration, and the net proceeds will be placed at the disposal of the Ladies' Centennial Commission of Boston.——A. D. F. Randolph & Co. have printed very tastefully in clear type the Rev. Dr. Storrs's address, delivered before the N. Y. Historical Society on April 15, on 'The Early American Spirit and the Genesis of it.' Though commemorating the seventieth anniversary of the Society, it is really one, and one of the best, of the Centennial orations of the day. The Centennial, by the way, comes opportunely to redeem our "eloquence" from the disrepute into which politics had plunged it.——Cassell, Petter & Galpin send us the first four parts of a new 'History of the United States,' written anonymously from an English standpoint and for English readers primarily, but in a fair and sympathetic spirit. We can better speak of its merits as the work progresses. The mechanical execution is noticeably good, and the illustrations fresh and helpful, always excepting the unprofitable kind for which the imagination alone is responsible, such as (p. 60) the massacre of the settlers by the Indians, the subsequent flight of the latter (p. 72), the last moments of Sir Humphrey Gilbert (p. 12), Pocahontas saving Capt. Smith's life (p. 31, a double exercise of the fancy), etc. etc.—all full-page wood-cuts.——The United States Naval Institute was founded at Annapolis in 1873, and the papers read at the monthly meetings during that and the following year have now been collected in one volume of 'Papers and Proceedings.' The contents are in every way creditable to the members of the Institute and to our navy. The voyage of the *Tigress* in search of the *Polaris;* the interoceanic canal *via* the Isthmus of Darien and the Atrato River; the manning of our navy and mercantile marine; the fight of the *Monitor* and *Merrimac*; our fleet manœuvres in the Bay of Florida, are papers which will interest the general reader. Among the more technical topics are compound engines; the requirements of the marine compass; the armament of our ships-of-war; and experimental determination of the centre of gravity of the U. S. steamer *Shawmut.*——The third annual report of the Managers of the Zoölogical Society of Philadelphia shows a large accession of members, very considerable additions to its collection of animals, and a flourishing condition generally. The financial scheme of this Society deserves the attention of any city desirous of mantaining a zoölogical garden. "Those who are seeking a good return for their capital will find," says the report, "in the certificates of the loan of this Society a sure and profitable investment." These certificates (for $100 and upwards) bear interest at six per cent. in money and two and a half per cent. in tickets of admission to the garden.——We learn that Professor C. F. Hartt of Cornell has been appointed, with Major Continho, a Brazilian, to take charge of the Geological Survey of Brazil.

—Evidently, American literature for the next few years is to be markedly retrospective in character. The physical and the moral landmarks of pre-Revolutionary times are finding their host of commentators, illustrators, and preservers. New York has had rather less than its share of these, certainly as compared with a city like Boston, and we are glad of any symptoms of an active antiquarian interest in the past which is entirely gone, as well as in that which is rapidly passing away on this island. Both these links in the continuity of the history of New York are caught up in a work of which the first number lies before us: 'Old New York, from the Battery to Bloomingdale' (G. P. Putnam's Sons). The projector of it is Mrs. Eliza Greatorex, with whose etchings of scenery in Colorado and of the home of Albert Dürer many of our readers are doubtless familiar. She is an artist not in the front rank of etchers, certainly, but her work always commands respect, and this her latest seems to us equal to her best. She looks at the few historic buildings left us through a veil which softens out of sight their present incongruous surroundings, and creates as far as is possible an illusion of the century whose true physiognomy we strive to recall. Most successful from a picturesque point of view is the old Jersey Ferry House, but there is little to choose between the remainder—St. Paul's Church, the Battery, the Carey-Ludlow House, and Sir Henry Clinton's headquarters. A view of New York from Hobuck (Hoboken) in 1796 is copied from an original sketch by Archibald Robertson, and is a curious memento of both the Jersey and the New York shores of the Hudson. More sketches by the same and perhaps other artists, which have never yet seen the light, will be inserted in 'Old New York.' Mrs. Greatorex's etchings are in pen-and-ink, reproduced here with unusual sharpness by some of the photographic printing processes; the text, by M. Despard, is gossipy rather than learned. A history of New York, by another lady, Mrs. Lamb, is, we believe, in press, and will be liberally illustrated from manuscript and other sources in respect to the antiquities of the metropolis.

—Professor Joseph Winlock, Director of the Observatory of Harvard College, died suddenly after a brief illness last Friday morning, June 11, at the age of forty-nine. One of the foremost of American astronomers, whose honorable career in science began thirty years ago, who has filled with great credit several important positions of scientific labor and trust, is thus cut off in the midst of a life whose usefulness cannot be estimated by ordinary standards. Well-known and highly estimated by all active collaborators in astronomy, both at home and abroad, he was never so well-known to others or to the public as his important services deserved. This was chiefly on account of a modest shrinking from any candidacy for honors, amounting almost to an aversion from them, and an indifference to an uncritical or merely popular reputation. Immediately upon graduating from Shelby College, Kentucky, in 1845, he was appointed Professor of Mathematics and Astronomy in that College, where he remained until 1852, when he removed to Cambridge, Mass., and took part in the computations of the 'American Ephemeris and Nautical Almanac,' then under the superintendence of Admiral C. H. Davis. In 1857, he was appointed Professor of Mathematics of the United States Navy; and in that capacity served in succession as Assistant at the Naval Observatory at Washington, as Superintendent of the Nautical Almanac and as Director of the Mathematical Department of the Naval Academy at Annapolis, Md. On the breaking out of the war, in 1861, he was a second time made Superintendent of the Nautical Almanac. His next service to astronomy was in the position of Director of the Observatory of Harvard College, and Phillips Professor of Astronomy, to which he was appointed in 1865—a position already made highly honorable by the labors of his predecessors, the distinguished astronomers, Professors W. C. Bond and G. P. Bond. He has also served at the same time as Professor of Geodesy in the Mining School of Harvard College. Only a few months ago, Mr. Bristow appointed him the Chairman of the Congressional Commission for Investigating the Causes of Steam-Boiler Explosions. These many appointments to places of responsibility are evidences of the rare sagacity, skill, sound judgment, and integrity of character which were qualities conspicuous to all who knew him well or dealt with him in his various duties. Upon taking charge of the Cambridge Observatory, he proceeded with energy to complete its equipment, adding to its already famous resources a meridian circle, constructed in accordance with his designs by Throughton & Simms of London—an instrument whose performance has been pronounced by competent judges the best of its kind in the world. The distinguished astronomer, Adams, of Cambridge, England, subsequently ordered an instrument from the same makers to be constructed on the same model. Professor Winlock also secured for this Observatory a very perfect astronomical clock, made by Frodsham of London, from which, through contrivances of his own, true time is telegraphed to neighboring cities. He also set the famous equatorial instrument of the Observatory upon a new career of usefulness and glory in astronomical spectroscopy. In 1870, he put into regular working efficiency a mode of observing the sun—namely, by a single lens, a heliostat, and photograph—which he independently conceived, and was the first to utilize as a form of systematic observatory work. French astronomers have lately been contending with one another about priority in the conception of this method of observation, which was so important a part of the equipment for observing the transit of Venus last December furnished to American expeditions; but in all that really constitutes effective originality the honor of this invention undoubtedly belongs to Professor Winlock. He was, however, almost entirely indifferent, in the singleness of his devotion to his favorite science, to popular fame, or even to contemporary recognition. Besides his observatory work, he was engaged on two occasions in the direction of expeditions to observe solar eclipses—namely, that to Kentucky in August, 1869, and that to Spain in December, 1870. Though ingenious as an inventor, his judiciousness was so much more prominent a quality that his originality is shown rather in a thoroughness and detailed efficiency of contrivance than in the more brilliant qualities that distinguish the more famous inventors. Very numerous little but very effective improvements in astronomical methods distinguish the astronomical art of the present day; and in these Professor Winlock's originality was very consider-

able. Among his published works, besides the 'Annals of the Observatory' under his directorship, are a set of tables of the planet Mercury (arranged with characteristic neatness and ingenuity); brief papers in astronomical journals and in the 'Proceedings of the American Academy of Arts and Sciences.' He was a native of Kentucky, and the grandson of General Joseph Winlock, who entered the American army at the beginning of the Revolutionary War and also served in the war of 1812, and was a member of the convention which drew up the constitution of the State of Kentucky.

—Every six months the Boston *Daily Advertiser* is made the medium of an æsthetic discussion more or less characteristic of the New England capital. The last time it was a musical question, and there was some heavy firing exchanged by the Teutonic purists and the Italian eclectics. To-day, Mr. Charles H. Moore writes in praise of the beautiful Paul Veronese lately committed to the care of the Athenæum (together with several French pictures of great value) by Mr. Quincy Shaw, and by way of pointing his moral gives a side-thrust at the fine examples of Millet in the same collection. Without delay, several anonymous writers spring to the rescue of Millet. Mr. Moore, at the time of our last information, had not rejoined, and perhaps will not feel himself obliged to do so, for the letters of his antagonists have the drawback of being rather vague and wandering, while his own communication was extremely definite and to the point. A short but intemperate note by Mr. W. M. Hunt (the only one signed) does not strike us as contributing a valuable element to the discussion. Mr. Moore, we say, is definite; he gives us an exact mechanical recipe for enjoying Paul Veronese. He recommends the student to make a parallelogram and fill it with a series of shades proceeding from black to white, and then mark on it certain points corresponding with the gradations of tone in the painter's flesh-surfaces. One should also (and this advice is not explicitly addressed to the "student") make a point of comparing a certain jewel on the breast of Saint Catherine with any detail—"if any can be found"—in the adjacent Millets and Troyons. The value of this advice seems to us to depend altogether upon what Mr. Moore means by the "student." If he means one thing, the performance with the parallelogram is quite too little trouble; if he means another, it is quite too much. If he means a youthful, unperceptive, undeveloped person who has been put upon a bench with a primer to get a lesson in "art" by rote, this after all rather simple contrivance will prove insufficient for making him apprehend the generous beauty of a fine Veronese. If, on the other hand, he means the usual intelligent amateur, the admirer, the observer, the enjoyer, the demands of the parallelogram will seem a very unmannerly intrusion. This latter student has a more effective process of his own.

—The operation of the jewel on Saint Catherine's breast seems superficially a simpler one, but we think this appearance is deceptive. (We assume, of course, that any other jewel on a breast in a picture of equal value by the same author, might be used in a similar way.) It involves, in the first place, your always having a Millet or a Troyon, or another French picture of equal value, in the immediate neighborhood, and it leaves you in uncertainty whether the "detail" which you have carefully selected in it for your experiment is really a detail at all, and whether therefore the experiment is not in the nature of things invalid. Paul Veronese is a magnificent painter, but the number of persons disposed to risk this amount of possibly unremunerated exertion for the sake of appreciating him is after all inconsiderable. There is only one rule of general application, we fear, for appreciating a picture—namely, to enjoy it. The greatest painter cannot ask more than that. Mr. Moore says excellently that "the men of deep and comprehensive insight perceive the necessity of complete characterization of every visible form." It is almost impossible, it seems to us, to state too strongly the rights of complete characterization. That is essentially what intelligent painting always proposes to itself. Some painters, of course, find it in one mode of representation, some in another, but it is what each in his own way undertakes to give us. Mr. Moore indeed affirms that Millet (of whom he thinks very ill) quite fails to give it to us—that the most he does is to "convey more or less of true and pleasant sentiment." But here again, surely, the critic is infelicitous. If we were obliged to define Millet's power in a single word, we would say it was the power of characterizing. Mr. Moore perhaps uses the word in some peculiar sense; we use it in that of representing objects so that the vision immediately recognizes their nature and use, and goes to meet them sympathetically, imaginatively, with relish and friendliness. Millet represents toil-worn peasants—their attitudes, their gestures, their clothes, their furniture, their implements, the soil in which they work, and (so far as he can as a painter) their temperament, their feelings. It is a perfectly definite class of objects, and we have always regarded the painter's representation of it as quite a triumph of solid, complete, persuasive characterization. We should even go so far as to say that there are sections of characterization in Millet's pictures, of corresponding dimensions, which have given us as much pleasure as that jewel on Saint Catherine's breast. We are afraid Mr. Moore's extreme enjoyment of Paul Veronese has made him unjust to the remarkable Frenchman—which is an unfortunate result for so elevated an emotion. We would strongly urge other students to guard against a similar accident; for surely the great Venetian himself, if he were to revisit the earth, would, with his superbly liberal sense of the pictorial, find an ample measure of the same gift in Jean-François Millet, and reflect sagaciously that the world is wide—since a brother artist can be so little of a Venetian and yet so much of a painter.

—The poetry of the *Atlantic Monthly* for July includes a rather large number of noticeable poems. One or two of these we should be inclined to quote at length were it not for the pathetic appeal made by the publishers, who inform the editors of the country at large that great injustice is frequently done by the reproduction of entire contributions from magazines, the sale of the original being often in this way interfered with, and the copyright (which the publishers of the magazine are very likely to own) also impaired in value. To some people it may seem strange that for such injuries as these the publishers or owners of the magazine should not bring an action at law, since there can be no doubt that the reproduction of a copyrighted article or poem is an actionable offence. But the explanation of their somewhat suppliant attitude on the subject is, we suppose, that an action for what seems on its face to be a compliment would have rather an odious appearance, and would be likely to open the flood-gates of editorial calumny upon the heads of the offending publishers. It would also be unquestionably difficult to prove what amount of damages were due the publishers. However, the publishers certainly have a right to what they ask, and we are therefore prevented from quoting entire one or two of the shorter poems in this number, particularly Mr. Lowell's sonnets, and a poem by Mrs. Kemble called "Waking." The latter undertakes to express a kind of pain which we should say, speaking from general recollection, had not often been attempted in verse, and to our mind the verses are very powerfully impressive, almost throughout. The last lines, we confess, appear to be dragged in to complete the extremely difficult measure, but to all those who have known the dull leaden weight of a grief which sleep only seems to numb for the time, we think these lines must prove more than interesting. Mr. Edgar Fawcett has some pretty verses on "Moss," in which he achieves a simplicity rather unusual with him, and Mr. T. B. Aldrich contributes a poem on "Identity," which describes an incident in "Twilight Land" and in "No Man's Land" the exact nature of which we do not make out. In this land, which at the first blush we should suppose to be the next world, two "hurrying shapes" meet and bid each other stand. One cries out agape, "And who are you?" to which the other replies, "I do not know, I only died last night." This reply, taken in connection with the title, seems to imply that Mr. Aldrich wishes to suggest an heretical doubt as to the identity of souls before and after death, but as this fancy is hardly in Mr. Aldrich's vein, we suppose we may be mistaken, and can only regret that no solution of the puzzle (which as a puzzle is pretty enough) is promised in the August number.

—The prose in this number of the magazine comprises among other contributions an article on "Passing the Cataract of the Nile," by Charles Dudley Warner; an account of the battle of Bunker Hill, by Mr. Horace E. Scudder; a scientific study of lightning and lightning-rods, by Mr John Trowbridge; an account of the progress of Russia in the East; an article on "Washington in Cambridge," by Alexander McKenzie; and an essay descriptive of an "obsolete fine gentleman," who is no other than the Italian fine gentleman of the latter part of the eighteenth century, as he appeared to the eyes of the satirist and poet Parini; as well as another instalment of "Roderick Hudson," by Mr. James; an essay on the "Social Aspects of the German Romantic School," by Hjalmar Hjorth Boyesen; and a story called "Broke Jail," by D. H. Johnson. The names of most of these authors are so well-known that the reader has a pretty clear idea beforehand what to expect from each of them. This, however, cannot be said of Mr. Trowbridge. His article ought to be read by all householders who have been of late years deluding themselves with the belief that the lightning-rod was an obsolete invention, which instead of directing lightning from a house attracted it. The fact seems to be that Franklin's name is deservedly honored, and the reason why lightning-rods have here and there earned a bad reputation is because they have been badly erected or badly connected with the ground. Mr. Howells's article will be found ex-

tremely pleasant reading, and we should recommend Mr. Warner, before writing anything more of foreign travel, to study his style a little. Mr Warner does not seem to have made up his mind in writing about the Nile whether to describe his adventures naturally, or in the manner of Mark Twain, and shows an inclination to "drop into" humor of a sort that is beyond all endurance.

—The London *Times* of May 25 contains a full report of the Rede Lecture delivered in the Senate House, Cambridge, on the preceding Saturday, by Sir H. S. Maine. His subject was: "The effects of observation of India upon modern European thought." The lecture is one of the ablest of Sir Henry Maine's productions. It exhibits in a condensed form his remarkable and, in our generation, unequalled power of philosophical analysis of the elements of early civilization, and his equally remarkable power of exhibiting the relations of modern institutions to the early, if not primitive, forms from which they take their origin. The lecture is written, as becomes a spoken discourse, in a style of great vigor and animation. It contains little that is absolutely novel to the careful student of its author's earlier treatises, but it presents certain important topics in a new light, and opens the way to fruitful fields of enquiry. The lecture is so rich in thought and abundant in suggestion that we cannot attempt a full analysis of it, but must be content to note only some of its most striking passages. After speaking of the circumstance that knowledge of India has deeply affected European thought in many ways, Sir Henry Maine points out the fact that Sanskritic study has been the source of certain indirect effects of prodigious practical importance. "There is no question of its having produced very serious political consequences . . . . for the new theory of language has unquestionably produced a new theory of race." But perhaps the most important of the numerous suggestions contained in the lecture is the following: "India has given to the world comparative philology and comparative mythology, it may yet give us a new science not less valuable than the sciences of language and of folk-lore. I hesitate to call it comparative jurisprudence, because if it ever exists its area will be so much wider than the field of law." And the lecture is mainly devoted to showing that the undertaking to found such a science is conceivable and practicable. Incidentally, Sir Henry Maine touches on a great number of interesting matters, such as the contrast between popular and correct views of Indian civilization, the character of the Brahminical religion, the nature and operation of caste, and, most important of all, the Eastern forms of ownership and their relation to those of the West. This contribution to the history of property would alone suffice to give great value to the lecture. The lecture ought to be reprinted in this country. It is a contribution of no slight worth to the general stock of thought.

—Sir Henry Maine has the courage of his opinions. Here is one of his *obiter dicta:* "Competition is the regulated private war of ancient society gradually broken up into indistinguishable atoms." And here is a striking sentence: "Whenever a corner of the veil which hides from us the primitive condition of mankind is lifted, there are two positions, now very familiar to us, which seem to be falsified by all that we are permitted to see—all men are brothers; all men are equal." "I conceive," says Sir Henry Maine, "that the investigation [into the origin and growth of the social and juridical institutions and conceptions of men] might throw quite a new light on this part of the social mechanism. As one consequence of a new method of enquiry, I believe that some celebrated maxims of public policy and private conduct, which contain at most a portion of truth, might be revised and corrected. Among those I do not hesitate to place the famous 'greatest happiness' principle of Bentham. Great as is the reluctance to accept 'the greatest happiness for the greatest number' as the standard of morality, no observant man can doubt that it is fast taking its place in the modern world as the regulative principle of all legislation. The theory has great imperfections unless some supplementary qualifying principles be discovered, and for these qualifications I look to some new application of comparative methods to customs, ideas, and motives." A stronger plea for the value of abstract studies in a practical community like our own, trying to work out salvation by democracy and equality, could hardly be made.

—One of the latest of Mr. Ruskin's pamphlets is 'Proserpina: Studies of Wayside Fowers, while the air was yet pure among the Alps, and in the Scotland and England which my Father knew. Part I.' Discursive as all Mr. Ruskin's late writing is apt to be, and with indications of weariness and restlessness that give pain to readers conscious of their obligation to the writer, this little book exhibits in a delightful way Mr. Ruskin's unrivalled fineness of perception and truth of immediate vision. It is not a methodical botanical treatise, but it contains much exact information and poetic suggestion concerning plants which every lover of flowers is glad to get and would not easily find elsewhere. The frontispiece is worth study; it represents the common heath blossoming and stricken in days. It is a beautiful piece of draughtmanship, beautifully engraved, and might serve as a lesson to those students of drawing who are beginning to be discontented with the lifeless and ill-drawn patterns of Mr. Walter Smith and the infidelities to nature of Mr. Prang's admired chromolithographs.

—A remarkable etching by Rajon from Watts's portrait of Mill has just been published. It is not only a likeness in which the characteristics of Mill's face are rendered with striking correctness and simplicity, but is also a print of rare merit in technical execution. It may stand comparison with the best engraved portraits. While rendering the fine intellectual forms of Mill's head and the rigid lines of self-discipline which show the force of his moral nature, Mr. Watts has succeeded at the same time in indicating those subtile refinements of sentimental expression, and that peculiar mobility of countenance by which the emotional sensitiveness of his nature was exhibited. Such a portrait is the best possible illustration of the autobiography, outer and inner man being surprisingly illuminative of each other. The background and body of the portrait are too heavily etched for best effect—partly in compliance with a bad passing fashion; partly, no doubt, to reproduce as nearly as may be the deep tone of the picture. But the etching of the head is masterly. There is no waste or random work. It is the work of a man who knows the value of line not less than of tone—a praise that can be given to very few of the modern and popular etchers.

## GENERAL SHERMAN'S MEMOIRS.*

II.

THE story of the campaign of Atlanta is not given with a fulness proportionate to its importance, or quite in keeping with the amount of detailed description devoted to other campaigns. This is, no doubt, in the main an unavoidable thing, growing out of the nature of personal recollections. In narrating his own experience, the writer grows more general as his career widens. As a captain, he speaks of his regimental mess and his company officers. As a brigadier, he tells us of his colonels and their regiments; but when he becomes the commander of a great army, he rarely has occasion to extend his notice beyond the commandants of the wings of his army. There are some points, however, in which we think the book shows haste, and in which it is not yet too late to add profitably to the information given. One of the most essential things to enable a critical reader to understand the movements of a campaign, and one of the most satisfactory, is an analytical table showing the full organization of the command. This General Sherman usually gives, but not always on the same system. The table showing the organization of the army under his command at the time of Johnston's surrender, gives the name of the State and number of every regiment, with names of brigade, division, corps, and army commanders. That which shows the strength of the army with which the campaign of Atlanta was begun is full in numerical parts, but very deficient in description of the subordinate organizations, giving neither regiments, brigades, nor divisions, and names no officers below the grade of corps commanders or commandants of special detachments. It is often cumbersome to embody such tables in the text of a historical book, but either in the foot-notes or in the appendix they should be given with the utmost fulness and on a consistent and definite plan.

The "March to the Sea" will always have a romantic interest to the readers of American history, and Sherman's narrative of it is perhaps the most attractive part of his book. With his quick eye for the humorous, he seized upon many amusing facts, and they are generally so illustrative of events and of the character of the people, both white and black, that they are free from any well-founded objection. This is also true, in the main, of the description of the march from Savannah northward, though in giving his version of the burning of Columbia it would have been in better taste to have avoided offensive reference to Wade Hampton and his part in the controversy. The false accusation of having ordered the burning of the city was well calculated to exasperate a man like Sherman; but the proof of its falsity has long since been public, and a dispassionate statement of the facts was certainly all that was desirable. The circumstances made the charge credible to the whole body of the Southern people, and it was natural that they and their leaders should repeat it till it was both disclaimed and disproved.

The treatment of his personal relations to others is, throughout, the

* 'Memoirs of General William T. Sherman. By Himself.' Two vols. 8vo. New York: D. Appleton & Co.

vulnerable part of General Sherman's book. In all that belongs to the larger discussion of plans of campaign, he is just and fair in allotting the merit of authorship and execution. He gives to Halleck the praise for a comprehensive and correct strategy in the campaign of Fort Donelson and Shiloh; he accords to Grant the conception and execution of the campaign of Vicksburg; and he claims distinctly and without circumlocution, as he had good right to do, the origination of the movement from Atlanta upon Savannah and thence to North Carolina. The correspondence he quotes seems fairly to establish the fact that Lincoln and Grant yielded a rather reluctant consent to this plan of campaign at the outset, and would have preferred to transport his forces by sea from Savannah to the James River rather than have him complete the march of which the very central idea was that it should interrupt the Confederate system of railway communications beyond the possibility of repair.

When, however, the General touches upon relations more purely personal, he too often forgets the rule that the facts should be stronger than the epithets applied to them. Even in a posthumous memoir it should not be permitted to attribute bad character to others, or to belittle them, without giving sufficient evidence. Again, there are personal quarrels and even personal wrongs which the successful man can afford to forget, and which it is not generous to perpetuate. We have already referred to some instances of the former class of mistakes on the part of the author. In the latter will be put by nearly everybody his treatment of his final quarrel with Stanton and Halleck. Stanton, though an ardent patriot, was imperious and often wrong-headed in his judgment of the conduct and character of others. In the midst of the panic created by the assassination of Lincoln, his excited imagination saw wide-reaching schemes for turning victory into defeat by murder and treachery. Sherman's convention with Johnston seemed to him an unpardonable leniency towards the rebels against whom his heart was then hot, and he struck at it with all his force and by every means. Not to be with him in every radical purpose of reconstruction which he had was to be against him, and he acted accordingly. That he was unreasonable, that he was wrong in taking the public at once into the controversy, that he treated Sherman badly in assuming that he was not to be trusted in continued command of the army, is all very true. But as Sherman has the right to a friendly interpretation of his conduct in view of what we now know of the simplicity and straightforwardness of his character and the steadiness of his loyalty to the Government, so Stanton has a right to our remembrance of the wild excitement at Washington, when neither the theatre nor the bed-chamber was safe from the assassin, and when most men felt that the country's crisis was so supreme that neither friendship nor ties of blood should be considered if they seemed to conflict with the swiftest action in whatever was necessary to secure the result that threatened to slip from our very grasp. It is right that Sherman should give every fact, and tell us fully his motives and his feelings at the time, but it is to be wished that he could have brought himself years ago to calm the vehemence of his anger, and, unless there were better evidence of unworthy motives in Stanton than any that has been produced, to admit that he meant well for the country, however harsh was his action toward the General himself.

The offence Halleck committed was in adopting the theory of the Secretary of War, that a different course from Sherman's was necessary, and that as the latter could hardly be expected to act vigorously on a policy opposed to his own, he must be practically though not formally relieved of his command. He was mistaken, for Sherman would have attacked Johnston, if ordered to do so, just as vigorously as if it were his own suggestion. But it was not strange that this should have been viewed differently at Washington, nor that, in the intensity with which all leading men were aiming at decisive results, they should have forgotten even a proper regard for persons. We cannot see in either of these incidents the occasion for an implacable feud.

His careful explanation of the way in which he came to be charged with insanity during his early command in Kentucky is doubly amusing, chiefly so in showing how such arrows have continued to "stick in the side," and what pains the General now takes to remove what he thinks a stain left upon him, but which everybody else laughs at. For war uses, the people soon learned to wish for madness with his kind of method in it, as Lincoln jocosely wished more of his officers drank another general's whisky. The picture of Cameron surrounded by newspaper reporters, whom he retained as confidential friends in a council of war with a department commander, is well drawn, and hits off the political manners of the time in a way they deserve.

In the judgment Sherman passes upon his subordinates, it would be rash to question his justice, though it would seem that the victims of his censure are chosen somewhat at random, as are also the subjects of his praise. When failure in military duty is given as a reason for removing an officer from his command, the presumptions are very strong that it was demanded by the circumstances, and the purpose of a military memoir might not be fully accomplished if mistakes or bad conduct were not held up for blame, even when our sympathies would make us prefer leaving such old sores uncovered. But there are a few cases in which no blame is attributed, where nevertheless the mention is not complimentary. For instance, in giving his reasons for not assigning either Logan or Blair to the command of the Army of the Tennessee after McPherson's death, the General does not say that either had been lacking in courage or in capacity. On the contrary, the implication is a strong one that as division and corps commanders they had done their duty well. The reason actually assigned is curious. It is given in these words: "I regarded both Generals Logan and Blair as 'volunteers' that looked to personal fame and glory as auxiliary and secondary to their political ambition, and not as professional soldiers." As the General has taken pains to say, in his concluding chapter, that at the close of the war "some of our best corps and division generals, as well as staff-officers, were from civil life," it is clear that this should be regarded as one of those instances in which the wrong reason is given for a right action. It is every way unfortunate in expression, not merely in the use of the term "volunteers," but in the apparently implied assertion that the volunteers were actuated by "political ambition" and the regulars by "personal fame and glory." No man would sooner than Sherman claim for our officers and soldiers of all classes the merit of fighting for the noble cause of the Union from purest devotion to the country. The mere politician on the one hand, and the mere soldier of fortune on the other, would be despised by him as by us; and it is unfortunate that careless writing should have given so strange a shape to his statement, and one so tempting to severe criticism.

The publication of the book in the author's lifetime will at least have this advantage: that it gives opportunity for revision and correction. His testimony as to what passed under his own eye, and to so great an extent under his own orders, is too important an element in the history of the time to be allowed to remain in an imperfect shape, and we do not doubt he will prune it of blemishes and add to the fulness and accuracy of its statements of fact before he will be content to leave it for posterity. It deals less with comprehensive views of the "grand strategy" of the war than we wish it did; but this is, in part at least, due to its form as a book of personal recollections.

## LADY DUFF GORDON'S LETTERS.*

LADY DUFF GORDON'S letters may certainly rank among the most delightful in our language. They deserve to become classical. This was apparent when the first series was published, a few years since, and we may say it with equal emphasis on closing the present volume. The letters here contained were written during the last four years of the author's life, beginning on Christmas day 1865, and ending in the summer of 1869. She died at Cairo, in July of this latter year. She had spent seven years upon the Nile, and had become familiar with the river, the localities, and the people in a way that few travellers had ever done. Why and how this was her letters from Egypt abundantly show. They are introduced, here, by a short Memoir, written, with charming simplicity and in the best taste, by her daughter, and they are followed by a collection of letters written from the Cape of Good Hope during the winter of 1862-63. She had gone off alone to this distant region on the same sad errand which subsequently led her to Egypt—with the view of benefiting health. Her last years were spent in a struggle with consumption, which brought her life to a premature close. These letters from the Cape are also extremely entertaining, and if they are less so than those written in Egypt, it is the fault of the subject and not of the writer; for they show the same acute observation, the same strong intelligence, the same genial, sympathetic turn of mind, the same wit and fancy, and, above all, the same happy, easy, natural vividness of style. Like all the best writing of this kind, Lady Duff Gordon's letters are interesting not only for what they tell us of her subjects, but for what they tell us of herself. She was not only a "superior" woman in the usual sense of the word, but a thoroughly charming one: we read between the lines, and feel flattered by the sense of intimacy which we gather there. She was the product, evidently, of fine influences implanted in a grateful soil. She was born and brought up in a circle in which the intellectual tone, the standard of culture, was very high, and she strikes us as a woman of a great natural wit which had been quickened by every social advantage. She was evidently extremely clever; her mind moved lightly and easily

* 'Letters from Egypt, etc. By Lady Duff Gordon.' London and New York: Macmillan & Co. 1875.

through a liberal range of interests, and left an impression wherever it rested. If we were to attempt to describe her in a single word, we would say, we think, that she was remarkably *intelligent*. She understood easily. She has in perfection what the best minds of women have as their strong point—she is singularly appreciative. She divines, she sympathizes, she enters into things at short notice. She has an abundant, spontaneous humor, and though she writes gracefully, as a gentlewoman should, she has a kind of frankness and robustness and breadth of utterance which indicate the distinctively British temperament. Add to this that Lady Duff Gordon had a style which was almost a matter of genius—so colloquial is it, so natural, so perfectly that of homeward-bound letters, and yet so available for every purpose, so vivid, so correct, so apt at imagery, without visible effort. Add also to this, further, that she lived for years an idle, contemplative invalid in the midst of the most picturesque scenery, people, and manners in the world, and you have enumerated the various reasons why her letters should be delightful.

"A. seems to doubt whether he will come," she says in one of her letters, "and to fear that M. will be bored. Was I different to other children and young people, or has the race changed? When I was of M.'s age I should have thought any one mad who talked of a Nile voyage as possibly a bore, and would have embarked in a washing-tub if any would have offered to take me, and that with rapture. All romance and all curiosity, too, seems dead and gone. Even old and sick, and not very happily placed, I still cannot understand the idea of not being amused and interested. If M. wishes to see the Nile," she adds (M. was her young son), "let him come, because it is worth seeing; but if he is only to be sent because of me, let it alone. I know I am oppressive company now, and am apt, like Mr. Woodhouse in 'Emma,' to say: 'Let us all have some gruel.'" Lady Duff Gordon herself never ceased, to the last, to be amused and interested. Her life in Egypt was an exile (she spent her summers—the torrid African summer—as well as her winters there), and, so far as her own family and friends were concerned, a solitude. At the last she was without even a European female servant; she had domesticated herself thoroughly with her beloved Egyptians, and she led her invalid life with such help as they afforded, in spite of the fact that the present daughters of the Pharaohs know neither how to wash, to sew, nor to cook. She loved the Egyptians because, evidently, she had endeared herself to them. If she was an exile from home, she had at least made herself a regular "social position" in Egypt. It was a very high one, too. Her headquarters were for the most part at Thebes, but she was known and admired all the way up and down the river, and by the poor people in especial was regarded as a heaven-appointed Lady Bountiful—a sort of glorified missionary. As to missions in general she had, we believe, her own views; but she performed a constant work of charity and civilization. The people came to her for everything, especially for medicine, and she rendered them every service, from curing their colics to healing their conjugal broils. But with the great people as well she was on the best terms: the pashas and sheikhs seem to have greatly valued her influence and to have taken extreme satisfaction in her conversation. There is something extremely striking in the idea of this lonely English lady, struggling with a mortal disease, secluded, inactive, and apparently without exceptional means of munificence, making herself a sensible influence in this heavily-burdened Egypt by the aid simply of her tact, her generosity of feeling, and her mother-wit. It was the feeling that she was being of use and playing a part which helped her to become so attached to the land and its people, in spite of much that, at best, was dreary in her position. In the autumn of 1868 she attempted a journey into Syria, but wrote on her return that it almost cost her her life. "The climate is absolute poison to consumptive people. . . . . At Beyrout the Sisters of Charity wouldn't nurse a Protestant nor the Prussians a non-Lutheran; at Omar and little Blackie nursed me better than Europeans ever do. I did not like the few Syrians I saw at all." Omar was Lady Duff Gordon's dragoman, the hero of this pretty anecdote: "I am more and more of Omar's opinion, who said with a pleased sigh, as we sat on the deck of the *Urania*, under some lonely palm-trees in the bright moonlight, moored far from all human dwellings: 'How sweet are the quiet places of the world!'"

Lady Duff Gordon writes almost exclusively about Egypt and the people and things that surround her. Her allusions to what is going on in Europe are rare and brief; we do not know whether she made no others, or whether such passages have been omitted. She expatiates on the small details of her daily life, introduces all her acquaintances (always with the happiest vividness), and keeps giving news of her innumerable servants, pensioners, and visitors. We cannot deny ourselves the pleasure of quoting, in spite of its length, a passage about one of her friends. It is an excellent specimen of her style, and an example of what we mean by her being naturally an admirable writer:

"I have been much amused, lately, by a new acquaintance who, in romances of the last century, would be called an 'Arabian Sage.' Sheykh Abdurrachman lives in a village half a day's journey off, and came over to visit me and to doctor me according to the science of Galen and Avicenna. Fancy a tall, thin, graceful man, with a gray beard and liquid eyes, absorbed in studies of the obsolete kind, a doctor of theology, law, medicine, and astronomy. We spent ten days in arguing and questioning; I consented to swallow a potion or two, which he made up before me, of very innocent materials. My friend is neither a quack nor superstitious, and two hundred years ago would have been a better physician than most in Europe. Indeed, I would rather swallow his physic now than that of many an M.D. I found him, like all the learned theologians I have known, extremely liberal and tolerant. You can conceive nothing more interesting and curious than the conversation of a man learned and intelligent, and utterly ignorant of all modern Western science. If I was pleased with him, he was enchanted with me, and swore by God that I was a Mufti indeed, and that a man could nowhere spend time so delightfully as in conversation with me. He said he had been acquainted with two or three Englishmen who had pleased him much, but that if all Englishwomen were like me, the power must necessarily be in our hands, for that my 'akl' (brain, intellect) was far above that of the men he had known. He objected to my medicine, that it seemed to consist in palliatives, which he rather scorned, and aimed always at a radical cure. I told him that if he had studied anatomy he would know that radical cures were difficult of performance, and he ended by lamenting his ignorance of English or some European language, and that he had not learned our 'Ilm' (science) also. Then we plunged into sympathies, mystic numbers, and the occult virtues of stones, etc., and I swallowed my mixture (consisting of liquorice, cummin, and soda) just as the sun entered a particular house, and the moon was in some favorable aspect. He praised to me his friend, a learned Jew of Cairo. I could have fancied myself listening to Abu Sulyman of Cordova, in the days when we were barbarians, and the Arabs were the learned race. There is something very winning in the gentle, dignified manners of all the men of learning I have seen here, and their homely dress and habits make it still more striking. I longed to photograph my Sheykh as he sat in my divan pulling MSS. out of his bosom, to read me the words of 'El Hakeem Lokman,' or to overwhelm me with the authority of some physician whose very name I had never heard."

That is an attractive figure delightfully sketched, and it is one of many pictures, all freely and happily touched. In the singular medley of Dutch, English, Germans, Malays, and blackamoors who constituted society on the southernmost tip of Africa, Lady Duff Gordon found subjects of a very much less delicate picturesqueness; but her letters from Capetown and from the Dutch settlements of the inland country, where she visited, are extremely curious and entertaining. Even during the long, squalid voyage out, she writes charmingly. "Next day we got light wind S.W. (which ought to be S.E. trades), and the weather has been, beyond all description, lovely ever since. Cool, but soft, sunny, and bright, in short, perfect; only the sky is so pale. Last night the sunset was a vision of loveliness, a sort of Pompadour paradise; the sky seemed full of rose-crowned *amorini*, and the moon wore a rose-colored veil of bright pink cloud, all so light, so airy, so brilliant, and so fleeting that it was a kind of intoxication. It is far less grand than northern color, but so lovely, so shiny." We said that these letters deserve to become classical. When a book really deserves this fate, it generally achieves it, and toward it criticism must allow this volume to make its way in its own fashion. But one may at least say, without fear of talking too largely, that Lady Duff Gordon's letters will become classical to the point of being re-read, after a due interval, by any one who has read them once.

## LIFE OF THE EARL OF MINTO.*

LORD MINTO held high offices, and his keen sagacity and rare disinterestedness won the confidence of associates more celebrated than himself. He nevertheless failed to take rank in the first line of statesmen. His memoirs, therefore, owe their historical importance mainly to the light which they throw on the character of his friends, and by far their most interesting feature is the picture which they present of Burke, as seen by a friend and disciple, whose calm good sense prevented him from overlooking the defects of his teacher. In estimating the value of Sir Gilbert Elliot's letters, it should be noted that he belonged to that section of the Whigs which sympathized with every phase of Burke's opinions. He opposed the American war; he lost his seat on the defeat of the coalition; he joined in the prosecution of Hastings; he shared the hopes excited by the prospect of a Regency; and when the violence of the revolution divided the Whigs he followed the guidance of Burke and Portland. He was further united to Burke as much by intimate friendship as by political sympathy. In what-

* 'Life and Letters of Sir Gilbert Elliot, First Earl of Minto, from 1751–1806. Edited by his great-niece, the Countess of Minto.' London: Longmans; New York: R. Worthington & Co.

ever Elliot says of his hero, there is no danger of an underestimate of that hero's merits, and the coolness of Elliot's judgment is a guarantee against errors arising from the bias of affection. From his letters it is possible to see the impression which Burke, by his actual life and acts, made on his associates.

To appreciate what this impression really was is a great step towards understanding Burke's character and towards the solution of the enigma of Burke's career. How did it happen that his virtues and genius, which made him the prophet, never enabled him to become the statesman, of his generation? In the case of Burke, as in that of every other man of pre-eminent genius, there will be found to be a very close connection between the strong and the weak side of his nature. Elliot's letters bring into clear relief the fact which readers of Burke's works forget, that the writer's influence was due even more to moral than to intellectual greatness. "How high," writes Elliot, "does this [*i.e.*, the fact that Pitt had deserted Hastings] set Burke and . . . a few who have discerned between his *single right* and the popular and *universal* wrong. He was called mad and worse by many perfectly well-meaning men on this very subject, and he has now dragged his own party, the King, the Ministry, the Parliament, and all the rest of the world, by the mere force of truth and by his single vigor, into this measure." This capacity for catching the moral aspect of great questions, and for forcing it on the minds of others, was, even more than Burke's eloquence, the source of his influence. When he opposed the American war, or when he denounced the oppressions of Hastings, or inveighed against the Revolution, his "single right" was opposed to prevailing opinion. Few will now assert that in all these instances Burke was entirely in the right, but no one can deny that he seized hold of moral aspects in each question which escaped his contemporaries, and "dragged" the world by his vigor into his measures and policy.

The vividness, both of imagination and feeling, which lay at the basis of Burke's influence was also the cause of that strong personal attachment which gained for him in return the affection in addition to the admiration of his friends. The age was, it is true, rhetorical, and permitted the full expression of sentiment, but, after all allowance is made for this, the vehemence of Burke's affections is very remarkable. Rockingham had been a kind and just patron, but his follower felt his death with the keenness with which few men feel the loss even of their intimate friends. "Burke," says Elliot, "is overcome by the loss of his friend, and in a day or two will, I hope, be able to cry and relieve himself." The same ardor of friendship which appears in this passionate grief over Rockingham's death is constantly visible in Burke's intense admiration for the real or supposed talents, and equally intense desire for the sympathy, of his associates. Elliot was a man of far more than average ability, but Burke's obviously sincere admiration magnified his talent into genius. "You are too tall," Burke writes to his friend, "for the second rank; you *must* not be in it." "Sir Gilbert Elliot," he writes on another occasion, "is not found in the common shop of the diplomatic exchange," and he uses language of nearly equal eulogy with regard to "Elliot of Wells," a gentleman of no marked character and no special ability. The language of Burke's letters is calm when compared with the fervor in which he would speak of his friends' talents to their very face. Sir Gilbert made a speech of some merit, in which he pronounced a eulogy on Burke. The following passage from a letter to Lady Elliot describes Burke's feelings and behavior:

"Burke is quite out of himself on the subject, and I am quite convinced that nobody on earth except yourself can feel as he does about it. His expressions . . . are extravagant, and I will not repeat them. 'The most beautiful thing that ever was heard, divine beyond human sweetness,' and such like. . . . I went home with him afterwards to dinner, and he could not at all contain himself. He was darting every now and then across the room to embrace me. At dinner, without any provocation, he had his hand every now and then across the dishes to take my hand."

On another occasion, conversation turned in Elliot's presence on the power of speaking without interruption for hours. It happened that Elliot had on two or three occasions delivered speeches of three or four hours' length. "This," he writes, "was expatiated on by Burke till I literally begged for mercy, and I was really distressed, whatever you may think of it." The extravagant eulogy was the more absurd, as the occasion for it was one of Sheridan's greatest oratorical triumphs. It is in fact in perusing the account of Burke's exaggerated and often tactless praise of his friends that the reader of Elliot's correspondence first catches a glimpse of the defect which, more than any other intellectual or moral failing, deprived Burke of the weight naturally due to his virtues and capacity. This defect was a marvellous want of tact and of insight into character. Students who are impressed by Burke's prophetic foresight and charmed by his wonderful descriptions and analysis of character, find it hard to believe that the man who was so far-sighted was not equally clear-sighted, and that the writer whose immortal rhetoric has handed down to us the most brilliant pictures of his contemporaries, failed to see far into their character. Yet Elliot's letters alone would be sufficient to prove that Burke's want of tact in minor matters was simply one example of that singular lack of sound judgment which made his advice often more dangerous to his friends than to his enemies.

Two instances in which the good sense of his associates averted deplorable errors are worth special notice. When, in 1789, the King recovered from his illness, the Prince stood in a position which required from him and his partisans a display of the most delicate good feeling and stern self-control. The least want of respect towards his father was certain to ruin him and his friends in the eyes of the nation. He and his brother received, it must be admitted, the gravest provocation from the Queen. Burke was consulted, and "was very much of the Prince's mind for strong measures." The Duke of Portland and Elliot opposed and prevented a course of action the folly of which was at once apparent not only to Elliot but to his wife. "It is lucky," she writes, "that there was a *cool* head in the party like the Duke of Portland's; for, if I may venture to say it, Mr. Burke's advice was the worst possible. It is certainly material for the Princes to keep up an intercourse with the King, and the only means by which they will ever be able to justify their conduct during his illness." In 1791 the "Old Whigs" were compelled to decide what should be their attitude towards Fox. Burke prepared a memorandum to guide the Duke of Portland in an interview with the great Whig statesman, of whom Burke had till a year or two before been the ardent friend and admirer. The noticeable point is that the memorandum goes on the supposition that Fox was a liar. The absurd injustice of this supposition is apparent, but, even were it true, it would be fatal to Burke's insight, for his view of Fox's character in 1791 would, if well founded, show that he had for years revered as a patriot a man who wanted even the honorable feelings of a gentleman. Elliot refused to deliver the memorandum, which could only have turned a misunderstanding into an envenomed quarrel. Of the intemperance of Burke's anti-Revolutionary policy more than enough has been said and written, but it is startling to find him disgusting even the partisanship of Lady Malmesbury by the proposal to retaliate on prisoners of war for the execution of *émigrés* bearing arms against their country. These traits explain in part why the Whigs preferred in a leader the good sense and feebleness of Portland to the genius and passion of Burke, and make at least intelligible the dictum of Thurlow, that Burke "was a man of genius without wisdom."

A deficiency in judgment would not have debarred Burke from the highest posts had the consequences of this defect not been aggravated by a peculiarity in his external circumstances. To call him an adventurer in the ordinary sense of the word is the grossest injustice, since no man ever made greater sacrifices of interest to principle. It is nevertheless true that he pursued politics as a profession, and could not be indifferent to legitimate professional gains. Hence, even his friends considered that his services might be rewarded by pecuniary remuneration. In 1789, the Whigs expected to come into power, and Portland and Elliot considered "how to arrange Burke and his family in a manner equal to Burke's merits." The following was the arrangement contemplated: Richard, his brother, was to be Secretary to the Treasury, with a salary of £3,000 a year, and it was the intention of the Duke to give him on the resignation of the Secretaryship an office in the customs of a £1,000 a year for life. The arrangement as to Burke himself is thus described by Elliot:

"Edmund Burke is to have the Pay Office, £4,000 a year; but as that is precarious, and he can leave no provision for his son, it would be doing little or nothing of any real or substantial value unless some *permanent* provision is added to it. In this view, the Duke is to grant him a pension on the Irish Establishment of £2,000 a year *clear* for his own life, with the reversion of half of it to his son for life, and the other half to Mrs. Burke for her life."

No one will maintain that these or far greater rewards were adequate payment for the dedication of Burke's talents and industry to the public service. Looked at as professional pay, the pay is small, but the need for this payment not only tempted his friends to repay Burke in money rather than by high office, but also produced the more serious effect of making him appear to the public not a statesman of the rank of Chatham, North, or Fox, but a professional politician, who, if he did a good day's work, looked for fair wages. Nothing but the most scrupulous tact and the exercise of the soundest judgment could have saved Burke from the discredit attaching, in his case

most unfairly, to the character of an adventurer; and tact and judgment were exactly the qualities in which he was wanting. He surrounded himself with a body of relations and dependents who might have discredited a statesman of assured position. On this point an extract from a letter of Elliot's is conclusive:

"Burke has now got such a train after him as would sink anybody but himself: his son, who is quite *nauseated* by all mankind; his brother, who is liked better than his son, but is rather oppressive with animal spirits and brogue; and his cousin, Will Burke, who is just returned unexpectedly from India, as much ruined as when he went many years ago, and who is a fresh charge on any prospects of power Burke may ever have. Mrs. Burke has in her train Miss French, the most perfect *she-Paddy* ever caught. Notwithstanding these disadvantages, Burke is in himself a sort of power in the state. It is not too much to say that he is a sort of *power* in *Europe*, though totally without any of those means, or the smallest share in them, which give or maintain power in other men. Mirabeau said, like a true Frenchman, but with some truth, at one time, 'Ma tête aussi est une *Puissance*.' The same thing is almost true with regard to Burke, who does not, however, say it of himself."

In these sentences lies the secret both of Burke's failures and of his power.

*Abraham Lincoln:* sa Jeunesse et sa Vie politique. Par Alphonse Jouault. (Paris: Hachette; New York: F. W. Christern.)—If this little book is the work of a Frenchman who has only visited this country, as its opening paragraphs indicate, it is creditable to the author. It is commonly said that Frenchmen know little and care little about men and things beyond the limits of France, and it is gratifying to find a French press issuing a book so full of accurate knowledge and cordial appreciation of a man who, great as he was, was distinctively and exclusively American. The first part of the book treats of the youth of Lincoln, the second of his political career up to the time when he became President, and the third of his life at Washington, from his arrival there till his death. The first part contains a fuller account of Lincoln's early life than we recollect to have met with elsewhere; it is interesting, and appears to be authentic. The matter of the rest of the book is more familiar; it is well selected, well arranged, and clearly presented. The author knows our great President well, and admires him cordially. The following sentences show the spirit of his work. He says that his "principal dessein est surtout de montrer l'honnête homme dans le grand citoyen." Again: "à le voir, vous n'auriez pas reconnu de suite ce qu'un Anglais nomme un *gentleman*, mais vous n'auriez point osé affirmer qu'il n'en fut pas un, parcequ'on trouvait en lui cette absence de prétention et ce désir d'être courtois et affable envers chacun, qui sont l'essence sinon l'enveloppe des gens bien nés." The noticeable errors are few, and sometimes droll, as when our conventions are introduced to the French people under the name of *concusses*, and the famous Brooklyn preacher under the name of "le révérend Beecher Stove." The Indian Black Hawk becomes "le Faucon Noir." The statement that the Northern troops at Bull Run attacked "le camp du général Beauregard *solidement retranché*"—that Grant succeeded in placing his troops beyond the James River "par d'habiles manœuvres qu'il effectua *sans être inquiété*"—and that the assassin Booth was overtaken and put to death "dans les marais de Mary's County, *dans l'Illinois*," are the most serious mistakes that we have noticed. The absence of the Gettysburg speech of Mr. Lincoln is also, for the sake of French readers, to be regretted.

NEW

## *VALUABLE PUBLICATIONS*

SUITABLE FOR

## *Text-Books and Works of Reference*

In Academies, High Schools, Colleges, and Theological Seminaries.

1. *EPOCHS OF HISTORY.* Each 1 vol. 16mo, with outline maps. Price per volume, in cloth, $1.

"This series is worth almost its weight in gold."—*London Spectator.*

"This method of presenting history is well adapted to the exactions of the present age, and the series, if the forthcoming volumes shall answer the expectations raised by the volumes already issued, will form a cheap, compact, and valuable constituent of the library of any student or intelligent family."—*Boston Daily Advertiser.*

"Well printed, neatly bound, liberally illustrated with maps, convenient in size, and very well written, these dollar volumes ought to obtain a wide circulation."—*Phila. Press.*

The following volumes are now ready:

1. *THE ERA OF THE PROTESTANT REVOLUTION.* By F. Seebohm, author of 'The Oxford Reformers —Colet, Erasmus, More,' with appendix by Prof. Geo. P. Fisher, of Yale College, author of 'History of the Reformation.'
2. *THE CRUSADES.* By Rev. G. W. Cox., M.A., author of the 'History of Greece.'
3. *THE THIRTY YEARS' WAR*, 1618–1648. By Samuel Rawson Gardiner.
4. *THE HOUSES OF LANCASTER AND YORK;* with the Conquest and Loss of France. By James Gairdner, of the Public Record Office.
5. *THE FRENCH REVOLUTION AND FIRST EMPIRE:* an Historical Sketch. By William O'Connor Morris, with an appendix by Hon. Andrew D. White, President of Cornell University.

2. *ANCIENT HISTORY FROM* the Monuments.

In this series we have a compact but popular presentation of the highly important results of recent archæological investigation. The annals of Egypt, Assyria, and Persia, as derived from the monuments, and from the cuneiform inscriptions generally, are of the greatest importance to understanding the development of human civilization and the tendency of religious thought. Besides this, there has been brought out a mass of evidence and illustration on manners and customs, language and literature, tending to throw light on the earlier books of the Bible, a knowledge of which is indispensable to every well-informed man. This has heretofore been practically inaccessible because of the recondite manner in which it has been discussed. Each of these volumes has been prepared by specialists who are masters of their respective departments.

Now Ready:

1. *EGYPT.* From the Earliest Times to B C. 300. By S. Birch, LL.D. 12 illustrations.

Will be published immediately:

2. *ASSYRIA.* From the Earliest Times to the Fall of Nineveh. By Geo. Smith, of the British Museum. 13 illustrations.
3. *PERSIA* From the Earliest Period to the Arab Conquest. By W. G. W. Vaux, M.A. 5 illustrations.

Each 1 vol. small 12mo, cloth, price $1.

3. *MURRAY'S MYTHOLOGY.* Manual of Mythology. For the use of schools, art-students, and general readers Founded on the works of Petiscus, Preller, and Welcker. By Alexander S. Murray, Department of Greek and Roman Antiquities British Museum. With 45 plates on tinted paper, representing nearly 100 mythological subjects. 1 vol. crown 8vo, cloth, $2 25.

"A correct, useful, and sensible manual of mythology adapted for popular use, and also for use in higher schools and academies. It has the great merit of being perfectly intelligible, and at the same time that it is very scholarly."—*Christian Intelligencer.*

"Every reader of classical literature will find this an invaluable hand-book. It is comprehensive, and is particularly valuable because of the handsome plates that are given with the sketch of every prominent character in mythology."—*Buffalo Commercial Advertiser.*

4. *DR. GILLETT'S WORKS ON* Natural Theology.

*GOD IN HUMAN THOUGHT;* or, Natural Theology Traced in Literature, Ancient and Modern, to the Time of Bishop Butler. With a closing chapter on the Moral System, and an English Bibliography from Spenser to Butler. By Prof. E. H. Gillett, of the N. Y. University, author of 'Life and Times of John Huss,' etc. 2 vols. 8vo, cloth, $5.

"The great feature in this work is the wide extent which characterizes the discussion. Particular portions of the field have been often investigated, but we know not where to look for a work so complete and exhaustive as this of Professor Gillett. But it is not only the richest contribution yet made to the literature of the subject; it is of greatest importance as an effective weapon against the materializing and sceptical tendencies of the present period."—*Watchman and Reflector.*

*THE MORAL SYSTEM.* With a historical and critical introduction with special reference to Butler's 'Analogy.' Designed as a text book for schools and colleges. By Prof. E. H. Gillett, D.D., of the New York University. 1 vol. 12mo, $1 25.

UNION THEOLOGICAL SEMINARY,
NEW YORK, April 13, 1875.

*Scribner, Armstrong & Co.:*

GENTLEMEN: I have read Prof. Gillett's 'Moral System' with much interest, and gladly add my testimony to that of Dr. Atwater and others to its solid value. The historical survey which introduces the subject is a model of lucid and comprehensive statement. I do not know where more information can be obtained in so small a compass.

The analysis of Butler's 'Analogy' is thoroughly done, and the additional matter by the author is in the same line with that of this standard production, and adapts it to the needs of the present time.

The circulation of such a treatise in our academies and colleges will be highly useful.

Yours truly, WM. G. T. SHEDD.

SCRIBNER, ARMSTRONG & CO. will send their Catalogue of Educational Publications to any address on application.

*Any or all of the above sent, post-paid, on receipt of the price, by the publishers,*

SCRIBNER, ARMSTRONG & CO.,
743 and 745 Broadway, New York.

No. 5. Tam O'Shanter (R. Burns), To the Unco Guid (R. Burns).
No. 6. Death of Arthur (A. Tennyson).
No. 7. The Raven (E. A. Poe), Lucy Gray (W. Wordsworth).
No. 8. The Yarn of the Nancy Bell (W. S. Gilbert), The Lost Heir (T. Hood), John Anderson my Jo (R. Burns), Faithless Sally Brown (T. Hood).
No. 9. Make Way for Liberty (J. Montgomery), The Charge of the Light Brigade (A. Tennyson), On the Loss of the Royal George (W. Cowper), The American Flag (Joseph Rodman Drake).
No. 10. Songs of Seven (Jean Ingelow).
No. 11. The Brook (A. Tennyson), Our Dead (Miss A. A. Procter).
No. 12. Mother and Poet (Mrs. E. Browning), The Horn of Egremont Castle (W. Wordsworth), Mary Morrison (R. Burns).
No. 13. The Diver (Schiller), "Break, Break, Break" (A. Tennyson), Illusion (Miss Procter), Death's Final Conquest (J. Shirley).
No. 14. To the Skylark (P. B. Shelley), The Cloud (P. B. Shelley), Ode on a Grecian Urn (John Keats).
No. 15. The Death of the Old Year (A. Tennyson), The Old Year (Francis Turner Palgrave), Dirge for the Year (P. B. Shelley), New Year's Eve (A. Tennyson), Sonnet from the Portuguese (Mrs. Browning), Midnight Mass for the Dying Year (H. W Longfellow), Song of the Silent Land (H. W. Longfellow).
No. 16. The Power of Poetry (Matthew Arnold), The Cotter's Saturday Night (R. Burns), The Banks o' Doon (R. Burns), Bonnie Lesley (R. Burns).
No. 17. Elegy Written in a Country Churchyard (T. Gray), Hallowed Ground (T. Campbell), Is there, for Honest Poverty (R. Burns).
No. 18. The Red Fisherman (W. M. Praed), Ode on a Favorite Cat Drowned in a Tub of Gold Fishes (T. Gray).
No. 19. The Miller's Daughter (A. Tennyson), To Blossoms (Robert Herrick).
No. 20. Hart-leap Well (William Wordsworth), How they Brought the Good News from Ghent to Aix (Robert Browning), A Canadian Boat-Song (Thomas Moore).
No. 21. A Legend of Bregenz (Adelaide Procter), The King of Denmark's Ride (Caroline Norton), Gentle River, Gentle River (Thomas Percy).
No. 22. The May Queen (Alfred Tennyson).
No. 23. Dora (A. Tennyson), Alexander's Feast (John Dryden.)
No. 24. Look at the Clock (Thomas Ingoldsby), The Friar of Orders Gray (Thomas Percy), A Charade—"Campbell" (W. M. Praed).

To each purchaser of a complete set of above is given a copy of 'EDWARD OSBORNE.'

*EDWARD OSBORNE.*

By the author of 'Mary Powell.' A short story of the Stuart and Elizabethan Times.
*TWENTY-FIVE CENTS.*

*RAB AND HIS FRIENDS.*

With two fine Illustrations.
*TEN CENTS.*

KILBOURNE TOMPKINS,
16 Cedar Street, New York.
☞ Will be sent, post-paid, on receipt of price.

## *Auction Sale at Richmond, Virginia,*

ON THE FOURTEENTH OF JULY, 1875,
OF THE
*VALUABLE LIBRARY*

of the late *Hon. THOS. H. WYNNE*, Corresponding Secretary of the Virginia Historical Society. Rich in American Private Prints and Local Histories, Confederate States Publications, etc., etc.

Orders filled by the Auctioneer. Catalogues sent on application.

J. THOMPSON BROWN, AUCTIONEER,
1113 Main Street.

## *The National Series.*

This Series, numbering nearly 400 volumes, is the most extensive, the most complete in every branch of instruction, the most uniformly excellent, and the most universally popular Series of School and College Text-Books ever issued by a single publishing house. It includes among others the following:

### *Standard Books of National Series.*

Parker & Watson's National Readers.
Parker & Watson's National Spellers.
Monteith & McNally's Geographies.
Davies's Complete Mathematics.
Clark's English Grammars.
Emma Willard's Histories.
Beers's Round-hand Penmanship.
Peck's Ganot's Philosophy.
Jarvis's Physiology and Laws of Health.
Porter's Chemistries.
Wood's Botanies.
Cleveland's Compendiums of Literature.
Pujol's French Course.
Chapman's American Drawing.

### *Newest Books of National Series.*

Watson's Independent Readers.
Watson's Independent Spellers.
Monteith's Independent Geography.
Peck's Short Arithmetics.
Clark's Brief, and Normal Grammar.
Barnes's Brief History of the United States.
Steele's 14 Weeks' Course in each Science.
Wood's Botanist and Florist.
Peabody's Moral Philosophy.
Worman's French Echo.
Worman's German Series.
Searing's Virgil's Æneid.
Jepson's Music Readers.
Folsom's Logical Book-keeping.

The whole crowned by the unique collection of professional manuals known as

*THE NATIONAL TEACHERS' LIBRARY.*

In 30 volumes, headed by Page's 'Theory and Practice of Teaching.'

A Descriptive Catalogue and Price-List of all A. S. Barnes & Co.'s Publications will be sent free to the address of any Teacher or School Officer applying for it.

The "National Teachers' Monthly" commands in its editor and contributors the best professional talent the country affords. Subscription, $1 per annum.

A. S. BARNES & COMPANY,
EDUCATIONAL PUBLISHERS,
111 and 113 William Street, New York.
113 and 115 State Street, Chicago.
112 Camp Street, New Orleans.

# The Nation.

*NEW YORK, THURSDAY, JUNE 24, 1875.*

## The Week.

THE celebration of the Bunker Hill Centennial in Boston, though a great success as a spectacle, was remarkable most of all for the enthusiasm with which the Southern military visitors were received, a large majority of whom had served in the Confederate army. The cordiality of their reception not only took them, but took the Bostonians themselves, by surprise. They passed along the streets amidst a storm of applause, were overwhelmed with invitations, and encountered nowhere the shadow of old enmity or suspicion. General Fitzhugh Lee, in particular, was the object of the warmest attentions; one eminent physician, who in old days, it is said, would not permit his respirators to be sold at the South, being unwilling to stop the progress of tubercles in pro-slavery lungs, went out of his way to shake the rebel soldiers warmly by the hand. The Charleston company went out to Harvard College, were received and addressed by the President, who reminded them of the honorable place Southern names bore on the roll of graduates; showed them over the Memorial Hall, and received an expression from the Colonel of a wish that the college might hereafter promote, as in the past, not the greatness only but the unity of the nation. Ben Butler figured largely in the procession, as a kind of a soldier, being the commander of the State militia, and General Devens delivered the oration at the monument; but the two State Senators made no appearance, Mr. Dawes being doubtless overcome by the horrid massacres of negroes which he thinks are going on, and Mr. Boutwell being occupied with preparations for the second civil war which he believes to be impending. The political importance of the occasion can hardly be overestimated, because if Boston be disposed to forgive and forget, the rest of the country may be fairly presumed to be in the same mood; and we have at last the assurance that the period of hostile, coercive, and unconstitutional legislation is at an end—that we have seen the last of electioneering "outrages."

---

The Ohio Democrats have held their Convention and nominated William Allen for Governor and General S. F. Cary for Lieutenant-Governor. The platform is an out-and-out inflation document, denouncing the "contraction" of which the Republican party has been guilty, and "the further contraction proposed by it," declaring that this contraction has already brought "disaster to the business of the country" and threatens it with "general bankruptcy and ruin," demanding that this policy be abandoned, and "that the volume of currency be made and kept equal to the wants of trade, leaving the restoration of legal-tenders to par with gold to be brought about by promoting the industries of the people and not by destroying them." Another resolution—

"That the public interest demands that the Government should cease to discredit its own currency and should make its legal-tenders receivable for all public dues, except where respect for the obligations of contracts requires payment in coin, and that we favor the payment of at least one-half of the customs in legal-tenders"—

seems to be intended to "meet the views" of the repudiationists, since it either looks their way or means nothing. Another resolution denounces all sumptuary laws. It seems hardly credible, but it is nevertheless true, that Mr. Allen, the candidate for Governor on this platform, is an old "hard-money" man, and that "General" Cary is an old prohibitionist, besides being under charges of fraudulent dealing in the sale of a mine. To complete the tale, it need only be added that Senator Thurman, who has been playing the part of Old Roman among the Democrats for the last few years, and always, when an opportunity offers, bewails the depravity of the times, and is a great enemy of paper-money, made a ratification speech in which he admitted that some mistakes might have been made by the convention, but urged his hearers to remember that there are times when "demands upon us are so great" that it is the duty of every man to "put his shoulder to the wheel" and "let time correct whatever errors have been committed," and begged them to sink "all minor differences" and go to work for the common cause—"victory in Ohio" and the "death-knell of the Republican party."

---

Some of the newspapers have discovered that this platform has at least the merit of being honest, in advocating inflation in so many words, but this is a mistake. Take it all in all, with its fabrications about "general ruin and bankruptcy," the old talk about exceptional cases in which "the obligations of the contract" may require payment in coin, and its candidates, the work of the convention is about as rascally a piece of "politics" as we have seen in a good long time. It is the first serious mistake the Democrats have made since the elections last fall, and, unless we are greatly mistaken, will do more to injure them in the East and on the Pacific coast than it can possibly do them good in Ohio. The talk of Mr. Thurman about "minor differences," when he and everybody else knows that the currency is the great question of the day, places him in a very humiliating position. The Republican platform is non-committal as to this subject, and its candidates are good. Under these circumstances, we have no hesitation in advising any one who thinks our advice worth taking to vote the Republican ticket. We should give this advice exactly on the same grounds on which we should have advised any one in New York a year or so ago not to vote for "Jimmy" Hayes as a reformer.

---

During the week there have been several heavy failures in London in the East India and the metal trade, and these have involved the suspension of several bill-brokers and minor firms. So generally were these failures expected that they caused little uneasiness and no serious apprehension. They were the results of remote causes, the East India trade having been unprofitable for several years, and in the last two almost ruinously so. Since the panic of 1873 in this country, the market for English iron and steel has suffered badly, and it has been felt that it was simply a question of time when large concerns in this line of business would suspend. More failures are expected, but there are no indications of a panic, the conditions for one not existing. Gold continues to flow to London, the shipments from this country during the past three weeks having been over $15,000,000, which is the largest amount ever sent from here in so short a time. These shipments had little reference to the mercantile troubles in London, but nevertheless are timely, and cannot fail to have a good effect. When the unsound houses are discovered, and all which cannot go on suspend, money in London ought to become very cheap, and hopes are entertained that American securities will again come into favor to the extent of favorably affecting the exchanges between New York and London. Already this year we have exported $46,800,000 specie, which is the largest amount for a corresponding time on record; the largest previous shipment having been in 1866, when at this date $45,125,000 had been sent. The banks of the whole country have not gold enough to continue for a month shipments at the rate of the past three weeks, but the gold does not come out of the banks. It is sent to pay for five-twenty bonds called in and redeemed by the Treasury, and the gold is taken thence and put on shipboard. While the banks are losing gold, they are gaining in legal-tender notes, the New York banks having now about $69,000,000—which is more than they have held for years. A good part of the recent accumulation of these notes comes from the redemptions of national-bank notes which drift to New York during the dull season,

At the Stock Exchange, speculation was tame, but generally directed to depressing prices, until late in the week, when the tide was turned. United States bonds, both here and in Europe, have been strong, and at times enough higher in Europe than here to justify exports from New York. The outlook in regard to the crops was never better, particularly in the Southern States, where the cotton-fields now bid fair to yield a crop of 3,900,000 to 4,500,000 bales. All through the South more corn and grain have been put in, and it is thought that this part of the country will have, beyond its own wants, a large amount to export, which is something unusual. General trade continues dull, but it is "between seasons." Encouraging views are taken of the fall trade, there being good reasons for believing that the coming season will show more recuperation than any since the panic of 1873. At the present time manufacturing interests are depressed, production has been curtailed, and the only demand which can be looked for is that which arises from the necessities of consumption; in other words, no speculative demand is expected for any class of goods this year. But the necessary demand ought to be larger than last season; credits are not extended—in fact, were never more restricted. There will undoubtedly be a good many mercantile suspensions, but of firms which were weakened by the panic, and have since been using their past credit, and waiting, like Micawber, for something to turn up which would help them out.

---

The railroad war has been settled by the ratification, on the part of the respective directors of the Baltimore and Ohio and Pennsylvania Railroad Companies, of the terms agreed to by the representatives of these companies at the meeting in this city last week. The precise stipulations are not known; but it is known that the general passenger and freight agents of the two companies have been at work preparing a new schedule of rates; that the rivalry hereafter is to be kept within reasonable bounds—in other words, that rates are not to be reduced below actual cost, as they had been before the close of the "war." The roads were then carrying wheat from Chicago to the seaboard as low as two and a half mills per ton per mile—scarcely enough to pay for the coal burnt on the engines. The most significant and satisfactory feature of the settlement is the provision which permits no change without the sanction of the directors of each company. This puts a check on the assumption of irresponsible power by the president of each company. It had become too much the custom for Mr. Garrett to assume that he was the Baltimore and Ohio Railroad Company, and of Mr. Scott that he was the Pennsylvania Railroad Company. Each managed as if there were no directors, much less stockholders. By the settlement, a peril which threatened railroad credit and, beyond that, general disaster, has been averted. The prominent stock speculators were opposed to the settlement.

---

Investors who are looking about for nice, quiet railway securities into which to put their money, will find a good deal of food for reflection in the history of the railroad war, throwing, as it does, much light upon the management of trust-property. Mr. Tylor, in his interesting work on "Primitive Culture," has shown how many cases of institutions, or ideas, or theories, or feelings there are in modern society which are simply the result of "survival." They do not correspond to the facts of the present time, but they have lasted over from the past. We are inclined to think that the idea of the "trustee" must be one of these cases. The trustee, as he is described in musty old law-books published ten or fifteen years ago, is a prudent, thoughtful, sagacious man, generally of advanced years, and long trained in a profession which carefully discriminates between rights and duties flowing from conflicting pecuniary interests. The trustee as we know him in actual life, however, is generally a young, thriving man of business, who made his money by "operations," is generally known among his friends as "Tom" or the "Commodore," is generally profoundly ignorant of the existence of any rules of law or morality which forbid a trustee from speculating with trust-funds, and, in fact, generally regards trust-funds of which he has the management as a convenient means of "extending his lines," "building up commerce" in one direction or another, or breaking down some "combination." The presidents of the trunk-lines to the West seem to be good illustrations of the modern idea of the trustee, and we know of nothing more stimulating to the fancy or calculated to lend an interest to the daily life of the "small capitalist," than the sight of placards such as have been put up in the streets lately in all directions, with "Let the war go on," "Down with monopolies," etc., etc, printed upon them. To be sure, his property may disappear in the operation, but then he has the satisfaction of knowing that "Tom" has beaten the "Commodore" or the "Commodore" has beaten "Tom," as the case may be.

---

General Porter, of the Board of Public Works, has taken strong ground in the dispute with the laborers about the reduction of pay. In his reply to a Tammany committee which recently visited him on the subject, he declared that the taxpayers of the city should not be compelled by any act of his to pay more than the market prices for anything; that wages paid by Government to laborers in excess of the current wages "would appear to be mere gratuities"; and that he did not know what justification he could find for "giving away public moneys." And he added the significant remark, that he understood at the time the reduction was made a number of taxpayers, observing the great difference between the city and the current rates, were "actually in consultation with counsel with a view to proceedings in the courts" to enjoin the departments from paying wasteful rates. This, no doubt, was very startling news to the committee; but it ought not to have been. Indeed, an injunction ought to be the regular and normal way of stopping such abuses. The city is, so far as public works goes, exactly like any other corporation. The stockholders are the taxpayers, and the latter ought to have exactly the same right to restrain wasteful expenditure that the former have in a railroad or a factory. Particularly is this so since the reformed charter gives taxpayers general authority to set in motion an enquiry into the expenditures of money by the city officials. A legal opinion on this subject by counsel would be very interesting.

---

The last number of the *Christian Union* contains an article by "Mr. Beecher's editorial associates" upon the Brooklyn trial, which says in substance, and truly, that whatever the issue of the legal proceedings may be, public opinion will decide sooner or later, without doubt or disagreement, whether Mr. Beecher's life has "been rotten to the core or grounded in sincerity." "Men may hereafter question how far he was wise," they say, "how far he fell short in prudence or insight, or in rightly fitting his acts to the requirements of circumstances," but "it will not remain an open question whether his whole work was a fraud." They then ask those who blame him for going so far in his efforts to prevent an outbreak of the scandal to consider the injury which the outbreak has actually wrought to the community, and to ask whether, in view of the magnitude of this injury, he was not justified in his efforts to keep it quiet. This, however, suggests the obvious reply, that the "outbreak" consists almost wholly in an investigation of the ways and means employed by him and his friends to secure secresy. Had he shown at the outset the courage he preaches to other men in the pulpit, and collared Tilton when he accused him of debauching his wife, there would have been nothing, or very little, to examine or expose. Had he not made a bosom friend of Moulton, Moulton's iniquities would never have been laid before the community. The article concludes by calling on those who stand by Mr. Beecher to show their love for him by "doing whatever helpful and Christian deed lies nearest their hand." We go further, and call on the Tiltonites to show their love for that eminent man in the same manner. In fact, we advise both sides to display their fiery zeal in good works. Mr. Beecher's associates also

add that "we are members of one another, and living and dying we are the Lord's," which is true, with limitations. The devil, we fear, has a large interest in some of us, as will appear clearly at the right time.

'Ginx's Baby' has again been getting Mr. Edward Jenkins into trouble. Had he never written it, he would have remained in some obscure position, in which his duties and temptations would have been suited to his powers. On the giddy eminence on which it has placed him, he comes to grief nearly every week. After making a ferocious attempt to settle the question of copyright offhand, he took up the relations of France and Germany, and let out the important secret that a bloody war between these two powers was prevented by a tract of the Peace Society, which was opportunely caused to fall into the hands of the Prussian military men. He then took up, in the House of Commons, the working of the Commission which has been charged with the financial part of the process of disestablishing the Irish Church—a difficult question, requiring considerable knowledge of Ireland, of the Church, and of accounts to deal with it satisfactorily. Mr. Jenkins accordingly blundered grossly in his facts, cast foul and unwarrantable imputations on honorable men, and so thoroughly disgusted the House, that though there is a strong case against the Commission, only 34 members voted with him, against 148. The *Pall Mall Gazette* says that "no member of the House of Commons has yet succeeded in arousing feelings of antagonism and irritation in the same degree as Mr. Edward Jenkins, and no other member could have so completely frittered away a strong case as he did" on this occasion. A speedy return to the composition of little philanthropic novelettes would, indeed, seem to be the course which all the signs of the times press on this statesman's attention.

The right of Mr. Keet, the Wesleyan minister, to put the word 'Rev." before his name on his daughter's tombstone in the churchyard of Owston Ferry, in England, has been solemnly argued by counsel before the Chancellor of the Diocese of Lincoln, who is a young man and the bishop's son. The facts in the case are already familiar to our readers, and the report of the proceedings in court reads very much like a caricature by some satirist who hated the clergy. The Chancellor has solemnly delivered judgment in the case, refusing the citation asked for directing the vicar to allow the obnoxious inscription to be made. It is difficult to read the decision with a grave face. It holds that, if the use of the term "Reverend" implies that the person bearing it is entitled to administer the sacraments, it would be against the laws of the Church to apply it to a Wesleyan minister; moreover, the use of the title was forbidden by the teachings of John Wesley and the rules of the Wesleyan Conference, which it appears, on a pinch, the Chancellor thinks himself bound to enforce. If, on the other hand, it was admitted, as had been contended at the bar, that the epithet "Reverend" was a title of courtesy, and might be given to all persons "worthy of reverence," it must still be denied to Mr. Keet, because, though he might be a very estimable person in private life, and though there might be some strong excuse for his being so bad a thing as a Wesleyan, yet the Church could not admit that a Wesleyan minister was, as such, "worthy of reverence," because he was a schismatic. Besides this, if he was allowed to call himself "Reverend" on his daughter's tombstone, "it might be the means of disseminating doctrines inconsistent with those of the Church." After turning the matter over thoroughly, the Chancellor could see no way of granting the application unless the inscription were so worded that it would show that it was only "an asserted title," or in other words, we suppose, unless Mr. Keet would make it "The so-called Rev. Henry Keet," or the "soi-disant Rev. Henry Keet," or the "alleged" or the "self-styled Rev. Henry Keet"—which he is hardly likely to do. He has given notice of an appeal from the Chancellor's decision, and the case will probably go to the Judicial Committee of the Privy Council, but no doubt is entertained as to the final result. He will certainly be allowed to call himself "Rev." on his daughter's tombstone if he pleases. The decision of the Chancellor, who is a rather light-headed young man who holds the place as his father's son, is commented on in the *Times* in terms of not unmerited severity, as it is only prevented from being exasperating and insulting to Dissenters by being very absurd.

There is just now a curious controversy going on in Germany as to who is responsible for the late "scare," the official press being apparently disposed to throw the blame on the "semi-official," which got up the talk about the French *cadres*, and was supposed to be "inspired" by the Foreign Office. A report, however, that the Press Bureau of the Foreign Office, which supplied information to well-behaved newspapers, was suppressed, has been denied, inasmuch as there is no such bureau attached to the Foreign Office, while there is one attached to the Ministry of the Interior, which remains. The official paper says there never was any intention at any time of addressing a request to the French Government to reduce its forces or discontinue the reorganization of the army. The bulk of the work of mediation seems to have been done by England, Austria having refused to participate in it, and accordingly a somewhat acrid tone is taken by the German press towards England, on the assumption that her intervention took place rather in the interest of France than in the interest of peace. The conclusion to which all the pros and cons of the affair seem to point most clearly is that there *was* talk about calling on France to suspend her armaments or to restrict the size of her regimental *cadres*, and that it was allowed to get into the newspapers as a "feeler," and that it probably originated with the military men, who felt it to be their duty to act on military considerations solely, and that the remonstrances of England, and of the Emperor of Russia, and the shock which it evidently gave to the moral sense of the world, led to its being promptly dropped and repudiated—a course which was made all the easier through a frank disavowal of hostile intent on the part of France; and this France was enabled to make without loss of dignity, through the interference of England.

The Committee of Thirty have been busily engaged in the revision of the constitutional bills, and especially those on Public Powers. The important changes made in the first draft, of which we have already given a summary, are that a third instead of a bare majority of the Legislature is to have the power of requiring the President to call an extraordinary session, and both Chambers are to assemble as a matter of course on the death or resignation of the President, and the consent of the Assembly is to be necessary to a declaration of war. The most excitement prevails over the question whether departmental elections shall take place by general ticket, or by arrondissement, the Left being in favor of the former method and the Government of the latter, as offering greater facilities for the exercise of that supervision of the election which every French Government seems to consider one of its first duties.

Garibaldi has had another of those extraordinary tributes to his popularity with which his life has been crowded, and which he bears with such unshaken modesty and good sense. He has, with the picturesqueness by which his whole career has been marked, taken up the improvement of the bed of the Tiber as the work of his closing years, and on the 25th ult. brought his scheme before a crowded sitting of the Italian Parliament. His bill was passed by a unanimous vote, followed by a storm of applause from the galleries. It was declared "urgent" by another unanimous vote, and with another burst of applause. The enterprise is to cost $12,000,000, of which a portion is to be assessed on the property to be benefited by the change; two-thirds of the rest of the expense is to be borne by the Government, but not more than $6,400,000 in all; and the remaining third by the City of Rome. The improvements are to consist of a canal to aid the discharge of the Aniene, one of the most important tributaries of the Tiber, and of the surplus waters of the river itself, and the construction of embankments within the city for the latter, and the discharge of the overflow into the marshes of the Maccarese and Ostia, so as to help to fill them up by the sediment; and last, not least, a port and a railroad connecting the city with it.

## THE CREDIT OF SOVEREIGN STATES.

MR. HUGH McCULLOCH has, in a recent letter to the *Tribune*, in commenting on the condition of American credit in Europe, declared his belief that the only thing now which prevents its "being of the very highest character" is the default of which many of the States have been guilty with regard to their public debts, and he cites the repudiation of her bonds by his own State, some forty years ago, as an example. These old repudiations by Mississippi, Pennsylvania, Indiana, and other States about that period are for the most part forgotten in this country. A new generation has come on the scene, which found all old liabilities "wiped out," and which has had a very pleasant time in riding on the wave of prosperity which came in with the railroads and has been rising steadily ever since; and it has troubled its head very little about the griefs of its fathers' creditors. But then the creditors have not forgotten, as Mr. McCulloch points out. They, for the most part, live in countries where it is not easy to forget the past and begin anew, and they belong largely to a class which finds great difficulty in restoring its fortunes if once impaired, and which cherishes with bitterness the memory of bygone losses. One still finds representatives of it among the old men, who look on Americans as swindlers and all American enterprises as humbugs, and keep their old bonds, with a certain cantankerous affection, as good things to swear over after dinner. Some of them, like the one Mr. McCulloch describes, might have "converted" their bonds, or got something in payment of them, if they had chosen to bestir themselves, but they preferred to avoid everything which might in any degree lessen the moral blackness of the transaction.

The memory of these mishaps might have died entirely out by this time, however, and would indeed have been buried by the financial success of the United States, if the misfortunes of the war, and the change which it wrought in the character of the electoral constituencies in several of the Southern States, had not caused a renewal of the frauds and defalcations on a greater or less scale. The carpet-bag régime was a terrible thing to follow close on the waste and destruction of the armed struggle, because on no side was it so mischievous as on the financial side. If the most upright and skilful men in the community had taken charge of the Southern State finances after the peace, they would have found their restoration a task of extraordinary difficulty, even if the voters had been intelligent and far-sighted. As things went, with very ignorant constituencies, led by the lowest order of adventurers, the wonder is that even greater havoc was not wrought with the public credit, and that any Southern State should now be in a position to offer any terms to its bondholders. Nothing can be more melancholy, in fact, than the condition of the Southern State securities. The Alabama Fives can be had for about 34; the Arkansas Sixes for 28, and the other obligations of the State for 15; Georgia, owing to the flight of the carpet-bag governor and the early passage of the State government into good hands, has her bonds at about 90. North Carolina bonds can be had, at prices varying with the description, from 51 down to 3½; those of South Carolina average about 33, and the "non-fundable bonds," or, in other words, those that are virtually repudiated, at 6¼. One denomination of Virginia Sixes reaches 64, the rest figure at about 36, and the "deferred bonds" at 8½; Tennessees, old and new, bring about fifty. Louisiana bonds of various kinds range from 37 to 25.

Of course the London Council of Foreign Bondholders is very gloomy over this state of things. We gave some account of their wailings two months ago. We have little doubt that many of the debts in this country of which they are disposed to take a dark view at present, will turn out better than they expect; but then we do not see much sign of improvement in the manner in which foreign money-lenders seek to protect themselves against deception and loss in their pecuniary transactions with governments. All the loans of this class put on the European Exchanges owe their success largely, if not entirely, to the traditional impression, which the promoters studiously strengthen, that the credit of a state may fairly be looked at from what may be called the standpoint of international law—that is, that as in the eye of the law all states are equal, however widely they may differ as to resources and population, and have the same rights, and are entitled to the same immunity from coercion or insult, so also their commercial honor may be treated as about equal also, and it may properly and safely be presumed that a "sovereign" state will not cheat or lie. We do not mean to say that the case is ever put in this bald way, or that it is ever asserted broadly that it is as safe to lend money to Ecuador as to France or England; but the mere terms of "sovereign" and "independent," the mere fact that the borrower is a government which has a treasury and levies taxes, are allowed to have a most deluding effect on the understanding, and to lead people to dispense with precautions which, in dealing with individuals, no one thinks of neglecting. In lending money to an individual, even though he be wealthy, and though the lender knows that if there be any default he can call the law to his aid, he places his main, or indeed almost his entire, reliance on character. He considers not simply what are the debtor's resources, but in what manner he is likely to manage them, what amount of will or zeal he is likely to bring to the discharge of his obligations. In dealing with a government, there is hardly ever any such careful weighing of the facts. The banker who disposes of the loan of course puts the best face possible on the matter, and makes urgent parade of the state's ability to pay, and the small subscriber, who is eager for his seven or eight per cent., takes it for granted that a government which is able to pay if it pleases is sure to please.

Now, there can, even from the moral, to say nothing of the commercial point of view, be nothing more deplorable than the ease with which badly-governed or dishonest communities get loans. It corrupts nations, as well as men, to be able to get money without trouble, and by the aid of fine words, and by making a parade of their mines and their revenues; and the matter becomes more serious when we consider that the accumulations of capital seeking an outlet are increasing rapidly at all the great moneyed centres, that simultaneously with this there is all over the world a rage for "public improvements," which finds vent in the assumption of heavy charges on future earnings. We are, therefore, likely to witness incessant borrowing for an indefinite period, but if there is to be any end to fraud and complaints of fraud, bodies like the Council of Foreign Bondholders must devote more time to prevention and less to cure. The best time to give advice to an investor is before he invests, and advice about loans to governments must now be based, more than ever before, on prolonged and recorded observation of the character of the borrowing community, as displayed in its financial legislation and the mode of administering justice. Fifty years ago, if you knew the character of one small class of public men, in most communities you could tell pretty well how any given political and financial problem would be dealt with. In our day this is no longer possible. The influences which determine the course of legislation are more subtle and varied, and come from a much greater number of sources, and the speeches and promises of "prominent men" mean much less.

When, for instance, an American State wishes to borrow money, lenders would do well to consider that, in the first place, although it is called a "Sovereign State," this term must be construed with considerable limitation. It can borrow like a sovereign, but, if it fails to pay, it stands in a very different position from any other sovereign state of similar resources and population, and no forcible redress can be obtained from South Carolina and Louisiana, for example, without encountering the whole power of the Union. This does not, perhaps, and ought not to make any substantial difference in the security, but it does, more or less, increase the popular indifference to foreign opinion, and is therefore to be taken note of in dealing with States whose population is below the average of intelligence. Another thing to be taken into account is, that in States in which the commercial element is not strong and influential, the sense of the value of commercial honor is apt to be small. An agricultural community, for instance, is apt to be more impressed by any legal or constitutional flaw in the making of a loan, than by the inexpediency

of taking advantage of this flaw. In the present condition of politics, too, when the changes in public offices and in the men who figure prominently in public life are very frequent, and all political careers are likely to be short, political traditions are apt to be very weak, and the knowledge of recent political history very poorly diffused, so that, as Mr. McCulloch has pointed out, the credit of a State may have received serious damage a very few years ago without the present generation of voters knowing much, if anything, about it.

For all these reasons, the best thing that could be done for the prevention of defaults and frauds by States would be what we may be allowed to call the accumulation of moral rather than material statistics. A record ought to be kept of the recent financial history of each State, showing in a plain way the mode in which former loans or guarantees were met; the tendency of legislation in financial matters, such as usury laws, stay laws, and all laws intended to interfere with the execution of contracts about money; the mode of appointing the judiciary, and the precautions taken or not taken for the preservation of judicial independence—which are generally a very good test both of popular morality and intelligence. A man who thinks a judge ought to be the exponent of popular opinion for the time being is apt to be, financially considered, an unsafe man, and it matters little whether he be a knave or a fool. We might multiply these suggestions indefinitely. It will be easily seen that they touch matters far more important to investors than the extent of the material resources. Everything that can be done ought to be done by the moneyed men to make the new classes into whose hands the governments of the world are passing see the importance of character to communities as well as individuals, that it is as wrong and dangerous to cheat by thousands as by ones or threes, and that the peaceful agriculturist has no more right to turn rascal than the hardened stockholder.

## POLITICS AND THE POLICE.

AN Albany committee appointed to investigate a supposed increase of crime in this city is now sitting here and examining witnesses. From evidence already published with regard to the comparative number of indictments and convictions before and since the success of the attack upon the Ring, it seems probable that there has been no positive increase of crime, but, on the contrary, a positive increase in the prosecution of criminal offences. Nevertheless, the condition of the police in this city is not such as to command universal confidence, and there can be little doubt that a searching investigation would bring to light many practices and customs of the constabulary which are of a most corrupting and demoralizing nature. One witness has been brought before the committee, himself formerly employed on the force, who swears that with regard to certain classes of habitual crime the police live upon them, levying upon the keepers of gambling-shops, "panel-houses," and "fences" a regular tribute, in consideration of which these are allowed to carry on their business, and entitled to receive notice of any intended descents ordered by the city authorities. How much of this story is true and how much an exaggeration we do not pretend to say, but it is not on its face improbable, and the results of investigations into police forces in other cities than New York have made most people ready to believe a good deal. An investigation into the police of Cincinnati, for instance, was made some years ago which brought to light the most astounding degree of intimacy between the police and the criminal classes—one police officer going so far as to have a regular place of deposit with a receiver of stolen goods, the two being in a kind of partnership. The State-Police scandals in Massachusetts showed a similar condition of affairs, though not so bad. In Brooklyn, when we hear of the policemen whose negligence enabled a burglar to enter a house and nearly murder a man being punished with the remarkable sentence of a three days' stoppage of pay, we cannot help feeling that the presumptions are rather against than in favor of the good administration of any police force.

There are peculiar reasons why the Albany Legislature should undertake this investigation, one being that it is itself the body which is responsible for the actual condition of the police. The Police Commission which has charge of the protection of life and property in this city is the direct product, and one of the most striking products, too, of the peculiar system of government to which this city has for the past generation been subjected. With regard to the other boards, such as that which has charge of the public works, or the parks, or the docks, there might be some pretence that their administration by a legislative commission was merely a matter of convenience and effectiveness; but this cannot be said of the Police Commission, because it is not merely a board charged with the duty of protecting life and property, but is also a political body as well, the control of which may in a critical time determine the fate of the Republican or the Democratic party. Through the Commissioners' hands all the votes cast in the city pass, and on their efficiency and integrity depends the fairness of an election. It is unnecessary to say that this is an un-American and extraordinary power to put in the hands of the police; that it makes of every man in the force a politician; that it makes his term of office dependent on political influences; that it makes it for the interest of each party as it comes into power to "rotate" the old Commissioners out of office—not necessarily because it wants to commit frauds, but in great measure because no politicians of common sense, who could in any way prevent it, would trust such machinery out of their own keeping. Nominally, the system has now been changed, and, under the present charter, the city government is to have control of its own commissions, but the cause of this is the fact that the same party happens to be in control at once of the administrative machinery in this city and at Albany. Were the Republicans to come into power in the State next year, they might be relied upon to make it "warm" for Democratic Commissioners. It does not require much imagination, for example, to foresee the terrible fury of the attack which would be made on such a Commissioner as Fitz John Porter.

The recent history of the Board which is charged with the duty of protecting life and property most of us have forgotten, but it is worth recalling. When the Reform party got control of the city by the election of Havemeyer three years ago, one of the first acts of the Custom-house politicians—the connection between Federal, State, and municipal politics is worth noticing here—was to prepare a charter for the city and convey it to Albany. Of course, being reformers, the first thing to be done was to remodel the Police Board as it had existed under the Ring, by turning out objectionable characters; one of the worst of these was a man named "Hank" Smith; yet, for reasons which it is not necessary here to go into, but which were solely political, Murphy, Bliss, Gardner, and Davenport decided that it was necessary to retain "Hank" in office, and he was so retained by a special act of the Legislature. The next step was for Mayor Havemeyer to appoint to act with "Hank" Mr. Oliver Charlick and Mr. Hugh Gardner; and Gardner's first official act was to move the appointment as Police Superintendent of a man named Matsell. Matsell had been an officer of police for many years prior to 1857, when the police was a band of roughs, constables, and politicians, and in 1857 supported Fernando Wood in armed resistance to the law. He then retired into private life, and occupied himself with publishing the *Police Gazette*, a paper which probably does more to stimulate the commission of crime of every kind than any single hardened criminal could do by his example in a lifetime, and which ought not to be allowed to be sold in the streets or to pass through the mails. The appointments now being complete, the Board went to work; and so well did they do their work that, before many months had passed, Gardner and Charlick were both indicted for fraudulent election practices, and obliged to resign their offices after conviction by a jury. Matsell, who is now in the Board, becomes President of it, and we find him called in, by the same body that regularly sets in motion the machinery which brings him and his kind to the surface, to aid them in their enquiries into the condition of the machinery for the repression of crime. To make the thing com-

plete, we should not omit to notice that on being summoned he comes in with his counsel, like a shrewd old man as he is, and on the first important enquiry is directed by his counsel not to answer —evidently on the ground that it is he himself who is under investigation, and therefore needs to be guarded against the danger of exposing himself to a criminal prosecution.

No one can expect to have a good police force so long as the administration of it is put in such hands, and the administration of it will certainly be so lodged as long as the connection between politics and the police is kept up. If we were to enquire into the cause of the increase of the number of indictments and convictions alleged to have taken place, we should unquestionably find that whatever there is of it is due to the increased efficiency of the judges and district-attorneys, brought about by the fact that the effect of the reform movement was to break up, in a measure, the connection between them and politics, while their professional dignity and social importance have been increased by a more secure tenure of office or increased salaries. If we had attempted to reform the Bench by "rotating" Barnard and Cardozo out, and rotating in their doubles, by means of special acts of the Legislature, we should have done something very like what we do now in attempting to get a good police while we make it a political body and hand it over to the Legislature to "fix." The experiment has been tried pretty thoroughly, not only in this State, but in Massachusetts as well, where the reformers, in their determination to put an end to the liquor-traffic, took a last farewell of all American traditions of civil self-government, and in Massachusetts, of all places in the world, introduced what was called a State Police—a sort of *gendarmerie* deriving its power from the central authority, but having a jurisdiction over the entire State, and in the execution of its peculiar duties of preventing the sale of liquor entirely superseding the local constabulary. What was the result? Nothing but corruption or charges of corruption on every side, while the sale of liquor went on very much as before. The experiment confessedly failed, as it ought to have failed. In New York, the Legislature have never gone so far in a centralizing direction as they have in Massachusetts, but have contented themselves with undertaking the management of the internal affairs of a single city. We have seen the result in the recent history of the Police Commission. We trust the Legislative Committee will not overlook this branch of the subject, for it concerns the body which they represent quite as deeply as it does the inhabitants of New York; and we may add that, unless they look into it, their investigation will be quite futile.

## THE DIPLOMATIC SITUATION IN EUROPE.

PARIS, June 4.

THE Government of the 24th of May was very severe towards the foreign press; a Vienna paper, the most important organ of Austrian journalism, the *Neue Freie Presse*, was prohibited in France, probably on account of its extraordinary zeal in behalf of M. Thiers. The Duc Decazes a short time ago put an end to this prohibition, and he has done well to allow the French public to become acquainted with the contents of the *Neue Freie Presse*, at least that part of the French public which understands the German language, and I must confess that it is not very large. It is well known in Vienna that the *Neue Freie Presse* is in constant communication with the Geheimer Rath Aegidi, the director of the press department in the *Kanzlerei* of Prince Bismarck.

It is certainly one of the most remarkable features of the situation that the most literary, the most popular paper of Vienna should be placed under this patronage. I would call attention to an important communication just made to it, which bears the mark of Berlin, though it is dated from Paris (under the date of May 17); it has for its title: "Retrospective View of the Berlin Interview, by a German Diplomat." This article affects the most authoritative tone; it is the work of one who does not conceal that he is behind the scenes, and knows all the secrets of the gods. The key-note of this review is the necessity, the force, and the durability of the Prusso-Russian alliance. This alliance is now more than a century old; it dates as far back as the death of the Empress Elizabeth; it has borne the trial of the greatest misfortunes; it has lasted during the most opposite circumstances, "from Lutzen to Tilsit, from Tilsit to Leipzig and Sedan"; the friendship of Russia and of Prussia has never had any long eclipse, while the quarrels of France and of Austria have been periodical. The personal relations of the two Emperors, William and Alexander—the latter represented as a "soft (*weiche*), amiable, and unprejudiced nature"—have in themselves something almost romantic. The nephew looks with pride on the achievements of his uncle. Between the two Emperors stands Prince Bismarck, who is, says the German diplomat, a *spiritus rector* There is no jealousy in the noble mind of the Emperor of Russia, no more than in the soul of the German Emperor, and both are ready to recognize in Prince Bismarck one of those leading minds who must be obeyed. There is even much personal affection in the sentiment which draws the Emperor Alexander towards Prince Bismark. The geniality, the robust good-nature, the manliness of the German Chancellor have gained his friendship. He knows that Prince Bismarck, strong as he is, will undertake nothing important without securing his good-will. In fact, the Prusso-Russian alliance has become the centre of all European politics.

As for Austria, she is now reconciled with Russia, but this reconciliation has been the work of Prussia, and Bismarck knows that "the new *rapprochement* has not yet borne the proof of fire." He looks upon the great difficulties of the Austrian Empire, and feels, like every impartial observer, that "Austria must renounce all independent initiative in the general affairs of the Continent and follow in all circumstances the new German Empire. The least deviation from this line of conduct, either in political or in religious matters, would alienate Germany and expose Austria to immense dangers." Our wise German diplomat observes like a philosopher of antiquity that true wisdom consists in submitting "to the inevitable, to the reality."

This picture is not much overdrawn as far as Austria is concerned. There are, to be sure, some Archdukes, such as the Archduke Albert, the conquerer of Custozza, and young Archduke Salvator, who think of a revenge of Sadowa, but the Austrian people bear no ill-will to Germany. Austria did not lose a province, not even a village, in the war of 1866. Public opinion in Vienna and in Pesth is completely engrossed with the financial question; the great *Krach* of two years ago is still the only subject of conversation. The Austrian people was somewhat of a novice in speculation; trade does not revive; the depression is extraordinary. For such places as London and New York the effects of a crisis are not permanent, but the Austrian financiers have been completely demoralized. Society has suffered much in Vienna from the effects of the *Krach*, and many people have been ruined. The Austrian state finances have always been in a miserable state; but Hungary, who wished after Sadowa to play the part of a great power, has now learned at her expense that it is a very costly pleasure. The deficit of the Hungarian budget is enormous, and Hungary has entered the great road which is marked by less and less remunerative loans.

The financial situation of Austria is pressing very heavily on her; it is not so in England; but all the wealth of Great Britain produces no effect on our German diplomat: he has discovered that in this nation "the flat Celtic element is getting more and more the best of the old, energetic Anglo-Saxon element." If Goldwin Smith heard this, what would he say? England becoming Celtic! England is described as now humbly paying court to the German Emperor in order to secure his mediation or his help in case of a conflict with Russia in Central Asia.

At the time when our German diplomat expressed so much contempt for Russia, England had not yet given any signs of a new policy. We have been led now to believe that she assumed at Berlin a new attitude, and Lord Derby's answer to Lord Russell in the House of Lords gives indications of a little more spirit than was expected from England. The *Times* has written some leaders in the old, proud style. It is quite evident that English pride suffers at the idea that her Continental influence is not felt as it used to be. But she did not take this new attitude without ample precautions. When Count Shuvaloff returned to London from St. Petersburg, he passed through Berlin, and he told Prince Bismarck that the Czar would have no unprovoked war between Germany and France. The conversation was long and stormy, and Count Shuvaloff was not, it seems, perfectly reassured by it, for as soon as he arrived in London he invited Lord Derby to send a pacific note to Berlin at the time of the arrival of the Czar. Prince Bismarck knew at once that Count Shuvaloff's hand was behind Lord Derby's writing, and he was so angry that he did not go to the railway station to meet the Emperor Alexander on his arrival, though his health had allowed him to go the day before to see his own Emperor. Alexander is generous, and not only did he pardon this fault of etiquette, he called on

Prince Bismarck a few hours after his arrival, and they had a long conversation, which was the true "interview of Berlin."

The German diplomat tries to unravel the mystery of this interview. What we all know is that peace was decided for the season. Prince Bismarck, feeling that war was impossible, said that he had never entertained the notion of it—that all this wild talk about war was the work of the newspapers. This was simply making a virtue of necessity. Whatever Prince Bismarck may aim at in the large field of European politics, he will never proceed without securing the neutrality of Russia. This neutrality is the key-note of his policy, the one thing which gives him constant preoccupation. He has shown little respect for the powers of the old Continent. Russia alone has always been the object of his solicitude. His Borussian blood may draw him towards the great power of the North; perhaps he feels that Russia is the great danger of the new united Germany, and that the danger ought to be averted as long as possible.

Prince Gortchakoff, the Russian Chancellor, likes to be considered as a rival of Prince Bismarck; he reached power as the representative of purely Russian ideas—almost as the enemy of Germany. Bismarck knows that Prince Gortchakoff would be very happy and very proud to outwit him. The Russian Chancellor preserves all the old traditions of diplomacy; he writes his despatches in French, and may be justly proud of the great purity of his style. Some of his despatches have become quite famous, as well as some of his sentences. I will only cite the despatch which he wrote to ask for the revision of the Treaty of Paris, made after the Crimean war. The professional jealousy of the two Chancellors has often been a difficulty for Prince Bismarck, but he has always contrived to use his Emperor as a *Deus ex machinâ*. Whenever a difficulty was created by Prince Gortchakoff, it was solved at Ems or at some other watering-place. In fact, Prince Gortchakoff, who had entered the lists as a *Slavophile*, had to become the witness and sometimes the tool of Germany; he allowed Bismarck to move quite freely in the labyrinth of the Schleswig-Holstein question; he could do nothing to hinder Sadowa; he saw the re-establishment of the new German Empire.

The German Chancellor worked while the Russian Chancellor wrote, or made delicate allusions, or said *bons-mots* in his conversation. Prince Gortchakoff could not well undo now what his adversary has done; but he is probably at the bottom of this new *rapprochement* between England and Russia which has been made manifest by the recent speech of Lord Derby, and which at once inspired the English press with a degree of confidence which it had not shown for a very long time.

I could add further details: not only has the Russian Chancellor invited his sovereign to draw a little nearer England, some advances have also been made to Austria. A military attaché who enjoys the personal friendship of the Czar was despatched after the Berlin interview to Vienna, and saw the Emperor of Austria. Some advice was given about the attitude of Archduke Albert, the conqueror of Custozza, who talks too openly and too freely about Prince Bismarck and the Prussians; about Archduke Salvator, who wrote a military pamphlet which did not please the Prussian staff: this young archduke is now in apparent disgrace, and has been travelling in France. Great prudence was recommended to Austria; at the same time, this recommendation was the mark of a real interest, and assurances of this interest were tendered in the most distinct manner.

The alliance of Russia and Prussia, which has been since the Crimean war the centre round which Prince Bismarck formed all his plans, is not yet on the point of being dissolved, but it is gradually losing its force. Bismarck felt that Russia had been injured by Europe, harshly treated, outlawed. He knew that Russia would think of nothing but the preservation of her Polish provinces and the revision of the Treaty of Paris. He steadily kept this in view, and if you study by the light of this single idea the history of the Polish insurrection, of the Danish war, of the war with Austria, of the war with France, you will, I believe, hold the thread of German diplomacy. The situation is now different. Russia is no longer a sort of outlaw in Europe; she is perfectly secure; she has revised the Treaty of Paris, and herself dictated the terms on which she would have the revision made. She is courted not only by Germany, but by all the powers of the Continent. A Russian princess of great intelligence, the favorite of her father, has entered the English royal family. Russia can choose her friends; and she may find that Germany has perhaps become too dangerous a neighbor. The moderation and the personal feelings of the Russian Czar will in all probability keep things as they are, and peace is not likely to be broken for a while. Yet, it is well to study the new directions of the great political forces. Germany has abused her victory; she has done what Napoleon the First did in his time; and the whole world is silently protesting against the despotic temper of the new masters of Europe.

# Notes.

G. P. PUTNAM'S SONS have in press, by arrangement with the English publishers, 'The Abode of Snow,' a record of travel in Thibet and Upper Tartary, from *Blackwood*. They will also publish, when prepared, a 'History of Transcendentalism in New England,' on which the Rev. O B. Frothingham is engaged.——The Boston *Medical and Surgical Journal* (Hurd & Houghton) for June 17 is a noticeable number. It contains a sonnet to Joseph Warren, by Dr. Holmes; a description of Warren's day-book; an account of the identification of his body on the battle-field by Dr. John Jeffries (contributed by the latter's son); an excellent engraving of his portrait by Copley; and papers on the sick and wounded at Bunker Hill, the medical profession in Massachusetts during the Revolution, by Dr. Geo. B. Loring, the diseases of America (by a Hessian surgeon), etc., etc.——A correspondent writes us: "Brachet's little French Grammar, mentioned in your issue of June 10, is inaccurate on many points, and any one who intends to use it should first take his pencil and correct its mistakes by means of the detailed review in the *Revue Critique d'Histoire et de Littérature* for December 19, 1874."——The prospectus of a new French quarterly has been handed us, to appear January 1, 1876, under the title of the *Revue Historique*. The conductors of it are to be MM. Gabriel Monod and Gustave Fagniez, and the catholicity of their management is inferrible from the fact that their staff of contributors embraces men of such opposite theological opinions as Tamizey de Larroque, Littré, and Renan. Other well-known writers engaged for the *Revue* are Fustel de Coulanges, Paul Meyer, Gaston Paris, Taine, etc., etc. Two features of this publication which deserve special mention are an historical bulletin of new books, discoveries of MSS., proceedings of learned societies, etc.; and an analysis of French and foreign periodicals. The attention of the *Revue* will be chiefly confined to the history of Europe during the period from the death of Theodosius (A.D. 395) to the downfall of Bonaparte (1815). F. W. Christern is the American agent.

—In the death of Samuel Gardner Drake at Boston, on the 14th inst., the students of American history have lost a writer who has contributed largely to their instruction. Mr. Drake was born at Pittsfield, N. H., in 1798, and when thirty years old removed to Boston, where for a great many years he continued in business as a bookseller. During that period he not only sold old and curious books, but he collected and studied them, and published many interesting and valuable works. His two hobbies were genealogy and the history of the Indians of New England. In relation to the latter subject, he published 'The Book of the Indians,' 'Indian Captivities,' 'Indian Biography,' 'The Old Indian Chronicle,' and also most carefully edited editions of Church's 'King Philip's War,' Mather's 'Relation of the Wars with the Indians,' and Hubbard's 'Indian Wars.' He also edited Mather's 'Wonders of the Invisible World' and Calef's 'More Wonders,' besides publishing 'Annals of Witchcraft in the U. S.' In 1870, he issued a 'History of the Five Years' French and Indian War.' Mr. Drake was also the author of the best history of Boston yet produced; and he made great collections for his work. It was not, however, a success either financially or as a local chronicle. Projected on too large a scale, it might better be termed a history of Massachusetts from a Bostonian point of view. Still, it contains a great deal of local history not elsewhere to be found, and possesses a solid value as a contribution to the history of the times. Some three years ago, the city voted a subscription of $5,000 towards the completion of the work, but the infirmities of age compelled the author to decline the tardy recognition of his services. It was as a genealogist, however, that Mr. Drake gained his most enduring fame. He was the real founder of the New England Historic-Genealogical Society, for he established and conducted its quarterly magazine—the *Register*, and thereby placed the association on the high road to success. For many years he edited the magazine, and though he wrote few elaborate genealogies, he revised and amended many, and he most cheerfully gave from the stores of his knowledge to all enquirers. To the disinterested enthusiasm of such men as Drake, and the still living Joel Munsell, of Albany, and John Ward Dean, of Boston, the credit is due of having kept alive the spirit of enquiry, or rather of having planted and protected the little twig which has now grown to be a vigorous tree. Mr. Drake's principal publication in this branch was entitled 'Result of Researches among the British Archives,' giving all of the information, as we pointed out a few months ago, to be found in Hotten's more pretentious volume, recently issued. As a collector of rare books, Mr. Drake was indefatigable. His first collection was sold, we believe, to Mr. George Brinley, of Hartford, a

second mainly to the British Museum, and a third w a in his t the time of his death. He was the recipient of many honors from learned societies, but at home certain unfortunate asperities in literary discussions prevented perhaps an adequate reward. He was enthusiastic in defence of his own beliefs in historical matters, and an unnecessary sharpness of language aroused enmities which now seem strange and senseless. Still, no man asked less of the public than he did, and the sum of his long labors is enough to keep his memory green for many years.

—It is announced that a Philadelphia inventor has discovered a new mechanical force, which, named for its discoverer, is called the "Keeley Motor." An instrument of moderate dimensions, called a "multiplicator," is fed with a small quantity of water, and from this water and the air there is developed a force of wonderful power, whose nature would seem to resemble the expansive power exerted by a condensed gas, and whose energy is measured by tons per square inch. If one-tenth of what is claimed for this motor be true, we are on the brink of a revolution equal to that which was brought about by the introduction of the steam-engine. Steam and water-power will become valueless, coal will be in demand only for domestic and metallurgical purposes ; and waterfalls will be left in their native wildness, where the lover of nature can enjoy their beauty unscarred by the workshops of men. It is not yet time to pass on the merit of this invention, the sight of which has as yet been accorded only to a privileged few ; but there is one thing which we may be certain of—it does not develop a remarkable mechanical energy without the expenditure of an equivalent amount of fuel of some kind, and the success or failure of the motor, assuming it to be an honest invention, will depend upon the cheapness of this fuel. The conservation of forces is as much a physical fact as the inertia of matter ; neither force nor matter can be created or destroyed—the most that can be done is to make an exchange of equivalents. The fuel consumed chemically in cells of the battery is as essential to the telegraph or the electric engine as is the fuel consumed by the fire in a locomotive fire-box ; and, in the same way, the "Keeley Motor" is either an ingenious mechanical fraud, or a device by which some new method of consuming fuel is applied to produce mechanical results.

—Two noticeable articles in *Harper's* this month are "A Glance at the Island of Lewis," with sketches taken on the spot, by Mr. William Black ; and one on "Caricatures of the Revolutionary Period," by James Parton. The latter reproduces some of the caricatures of Gilray, so many of which are just as good, or at any rate just as amusing, as they were a hundred years ago. In the other, Mr. Black, who seems as clever with his pencil as he is with his pen, takes us over a good deal of the ground with which the readers of the 'Princess of Thule' are already familiar, and gives a more detailed account of the lives and manners of the inhabitants of "The Lewis," the stalwart islanders, the "remarkably robust" young women with their picturesque costumes, the thriving port of Stornoway, the dull, desolate interior of the island, the half-Esquimaux bee-hive huts, without chimneys, but with their roofs of straw covered with turf, and, inside, the peat-fire saturating with its pungent smoke this straw, which is afterwards pitchforked off and distributed over the fields for manure—the value of the manure really standing in the way of a thorough-going chimney-reform in the interior of the island, where other manure is difficult to get. The songs of the Hebrides are plaintive, generally turning on the love of a young maiden who is deserted, or in some other way loses her lover ; and as the only native instrument permitted on the island is the jews-harp (the bagpipes having been tabooed by the Free Kirk) it may be imagined that the dance music cannot, as Mr. Black says, have "too much madness" in it. Those who are fond of tracing the genesis of pleasing fictions may be interested in a sentence which Mr. Black throws out with much apparent ingenuousness, as if he rather hoped the hint would be acted on by some new writer : "Here on the right lies the great island of Bernera, presided over by a worthy farmer and fisherman, who is called its King. Might not one by accident shorten Bernera into Borva, and begin to wonder whether, supposing the King of Borva has a daughter, she is as beautiful as the beautiful scenery in which she dwells ?"

—Mr. W. C. Brownell, a writer with whose name we are not familiar, though from the way in which he handles a pen we should be inclined to think him no tyro, contributes to the *Galaxy* for July an entertaining article on "English Lecturers in America." Going back to the lecturing days of Dickens, who may be said to have set the fashion in this matter, Mr. Brownell says very justly that since his time a notion seems to have prevailed among the literary class in England that America is the Atlantis of lecturers, where the third-rate littérateur may refurbish his reputation, better his social standing, and replenish his pocket. Going over the long list, however, of those who have come over to try their fortunes, including as it does Dickens, Thackeray, Edmund Yates, George Macdonald, Froude, Charles Kingsley, Mr. Edward Jenkins, Mr. Gerald Massey, Mr. Wilkie Collins, Mr. Charles Bradlaugh, a certain Dr. Porteous, of whose visit we must confess ourselves hitherto ignorant, and Mr. Proctor and Mr. Tyndall, Mr. Brownell shows very conclusively that many of these made a great mistake in coming at all, and that of the whole list only those succeeded who had really something to say or do (for it requires some latitude of expression to bring all these gentlemen in as "lecturers") in public which they knew how to say or do. For example, to hear or see Tyndall was a real pleasure and excitement even to an audience absolutely guiltless of scientific knowledge or capable of forgetting whether water was a compound or elementary substance ; but to hear many another of this throng of lecturers gave us no food for thought, and neither made us laugh nor weep, but only put us into the frame of mind in which the waiter to whom was pointed out the "great Thacker" must have been when he asked, "And what did *he* do ?" So, to look at the matter from another point of view, there was no particular reason to suppose that because the public had enjoyed reading the 'Moonstone' they would hunger and thirst for readings from it or other stories by the same author ; nor because they had read Froude's histories, and wondered whether they were true, that they should particularly care about the controversy raging between the historian and Father Tom Burke. Of course, what some of these gentlemen counted on when they came over here was the curiosity of the public about their personal appearance, for it seems that as long ago as Thackeray's ventures in lecturing he was aware of the possibility of a *succès de curiosité*, and plaintively observed to a friend of Carlyle that "*he* would not go around the country exhibiting himself for so much a night as I am doing" ; but they seem to have forgotten the important fact that the enormous increase of great men in these latter days has really created a glut in the market, and that the jaded curiosity of the public on the subject requires much stimulation. Great men for the last generation have multiplied so fast, and the agencies for manufacturing them have become so widespread, that lecture-goers have become satiated. Probably the best way that a man of real eminence could now find for making a genuine sensation out of his appearance would be to bruit it abroad in every direction that he never either read, lectured, or appeared in public. By this simple device we have no doubt that in a few years he would have the whole civilized world at his feet, begging him to come out and just let it "have one look." The general conclusion to which Mr. Brownell arrives is that the public in America is much like other publics, and that what it likes it is willing to pay for, and what it dislikes it cannot be persuaded into paying for. Minor celebrities abroad should reflect that there are a great many European reputations which are insufficient for a lyceum outfit on this side, just as there are many eminent Americans who would find themselves in like case in Europe.

—We summarize from an article in the *Pall Mall Gazette* certain particulars concerning the fair of Nizhni-Novgorod. In European Russia, there are at least 6,500 fairs, and new ones are constantly springing up. Since the emancipation of the serfs the demand for articles of luxury at these places of popular resort has been steadily increasing. The Nizhni fair surpasses all others in the numbers that attend it and the extent of its transactions: merchandise to the value of $300,000,000 is stated to be annually warehoused for it in the Russian Empire. This fair is in fact probably the largest and most important fair in the world, due mainly to the circumstances of its favorable situation at a point where the Oka flows into the Volga, thus connecting the industrial provinces of Central Russia with the Baltic, Western Europe, and Central Asia. The Kama, a tributary of the Volga, also connects Nizhni with the most remote Northern districts, the Ural, and Siberia. Cotton fabrics are the goods most dealt in. Since our civil war Asiatic cotton has been a staple at the fair, the nomadic tribes having commenced buying the calicoes expressly manufactured for them, in large patterns and glaring colors, in Russian factories. The woollen trade is here but of subordinate importance. Russian silks are offered at reasonable rates, owing to foreign competition ; raw silk, however, only comes to the fair in small quantities, the great bulk being forwarded direct to Moscow. Furs prepared for use are in constant acceptance. Moscow and Siberian merchants bring sables from the Yakutsk territory, and squirrel fur from the shores of the Obi, Yenisei, and Lena, and the north-west of European Russia ; Polish Jews coming to Nizhni to exchange beaver, river-otter, and musk-rat skins for squirrel skins. Dressed skins of hare, cat, fox, marten, squirrel, and lamb are in the market. Dyed cat-skins are sent in large quantities to China, but the export of other furs to that country has greatly diminished. Goat-skins come

from the Armenians of Nakhitchevan, and undressed leather, principally from Samara, Siberia, Perm, and Kazan, while Kostroma, Vladimir, and Nizhni furnish the fair with cheap shoes, the demand for which has greatly increased since the emancipation. Foreign iron is unable to compete at Nizhni with that of home manufacture, and only finds its way there in the form of nails. One-third or one-half of the value of the iron disposed of is paid for in cash, the remainder standing over until the following fair. Wooden trunks are sold in immense numbers to Asiatic dealers, at prices varying from four to seventy-five roubles. The Moscow money-boxes sent to the fair have locks containing a multiplicity of springs, which give forth musical sounds whenever they are opened.

—The business in corn has grown rapidly since the opening of the railway from Moscow: St. Petersburg can now be more readily satisfied. The last week in August, bringing news of the general harvest, is the most important to the trade; while the fair is being held the grain is stored in boats in the large corn dock on the right bank of the Volga. Astrakhan sends the whole of its train-oil and from fifteen to twenty thousand puds of caviare to Nizhni. Among liquors the greatest sale is of new wine, known as "tchikhir," coming principally from Kisliar. It soon spoils, and has generally to be purified with charcoal; wines of Russian growth are sold under foreign names. Grape brandy abounds since the remission of the duty. St. Petersburg sends sugar, which costs a rouble the pud more than that from Moscow; the Ukraine sugar is the cheapest. The demand for tobacco increases, but only the better kinds are dealt in. Drugs worth five millions of roubles are annually brought to Nizhni. Among the remaining commodities colonial produce occupies the next place, then come articles of dress, cosmetics, watches, china, glass, and earthenware. Tea, which used to be the most important article of all, still meets with a large sale. The chests on their arrival are piled up on the banks of the Siberian dock, and covered with bast matting. The entire stock never reaches Nizhni at the same time, a large proportion being frequently delayed until within a few days of the closing of the fair. The Russian tea trade is extremely complicated; tea is brought in the first instance to Kiakhta by Chinese merchants, who exchange it for Russian goods; the buyers sell it to merchants in Moscow, Irbit, and Nizhni, and these again dispose of it to traders who visit Nizhni, purchasing hundreds of chests at a time; there are, moreover, commission agents and middlemen, the latter of whom convey the tea from Kiakhta to Nizhni. As every one engaged in the trade levies his percentage, the tea is very dear by the time it reaches the consumer. Dealings are based exclusively on the invoices, which give so correct an account of the weight, class, and quality that the purchaser never thinks of having a chest opened; recently, Canton tea has begun to compete with that from Kiakhta. The transactions in commodities of all descriptions at the Nizhni fair ordinarily amount to about 125,000,000 of roubles, or about 90,000,000 dollars. The fair is held from the 25th of July to the 25th of August.

—A very curious literary fraud (as it really seems no more than just to call it) has lately been perpetrated by Captain J. A. Lawson, author of 'Wanderings in the Interior of New Guinea.' We read his book shortly after its appearance, and found it a remarkably entertaining record of travel. There was a certain vagueness about some of the author's statements, and many of his stories bordered closely upon the marvellous; but his manner of narration seemed most plausible, he gave, first and last, a good deal of detail, his work was published by a most respectable house (Messrs. Chapman & Hall), and, above all, the things he had seen and done were so curious that, if they were not true, the more was the pity. New Guinea (or at least its innermost recesses) has remained, in spite of the actual mania for exploration, very much of a *terra incognita*, and the author had, we confess, a capital accomplice in the vagueness of our own information, as also in that of most other readers. We say accomplice advisedly, for it now appears that Captain Lawson is an inordinate romancer—a Baron Münchausen who never so much as winks at you, to save his conscience. His volume has been attacked by several specialists—travellers, mountaineers, and naturalists, with the London *Athenæum* for their mouthpiece—all clamoring for proof of his extraordinary assertions. These have been so riddled by criticism that it is hard to see what remains as pure fact. We suppose it is a fact that Captain Lawson did repair, in the spring of 1872, from Sidney in New South Wales to the New Guinea coast (although even this fundamental statement has been seriously impugned), and that at Houtree, in the latter region, he did engage four servants and parties to accompany him into the interior. His own story is that, with three companions and a moderate amount of baggage, he dived into the unknown, and in the month of February following reappeared at his starting-point, exhausted, despoiled of his luggage, and with but two companions surviving. In the interval, he had apparently faced every peril that can beset a traveller in a country where men and beasts are equally objects to be avoided, and he had finally escaped only with his life from a terrific combat with the diabolical Papuans. We cannot enumerate the remarkable phenomena that came under his observation, but we must mention his great achievement—his discovery, namely, of the highest mountain in the world. Captain Lawson and his Papuan servant walked one autumn day up Mount Hercules—not indeed to the summit, which he sets down as 32,783 feet high, but to an altitude of 25,314 feet, where their physical sensations prohibited further advance. If Captain Lawson's story about Mount Hercules is true, it involves one of the most momentous geographical discoveries of our day, and one of the most extraordinary physical feats; if it is largely intermingled with fiction, it is of course a proportionately audacious imposture. The story has apparently created a breeze in the Alpine Club, whose members are naturally desirous to make the acquaintance of a mountain more than twice the size of Mont Blanc, and yet assailable without ropes, ice-axes, hobnailed boots, guides, or any of the usual Alpine accessories. Captain Lawson is apparently keeping quiet, either because his case is hopelessly bad, or because he desires to annihilate all his critics at a single stroke. The principal fact in his favor is that it is inconceivable a man should pull so long a bow in the face of almost immediate and certain discovery. Unless he makes a very telling rejoinder, we shall be obliged to class his book, in virtue of the quite heroic scale of its fabrications, with the first-class curiosities of literature. But even if it is demolished as a record of fact, it may have a certain fortune as a competitor of Münchausen and Poe's 'Arthur Gordon Pym'; though this would be doubtless, morally speaking, a better fortune than it deserves.

—The most popular of living Italian poets is perhaps Giosuè Carducci, better known by his pen-name of Enotrio Romano, who is pronounced by competent authority the best lyrical poet of Italy. Carducci is, however, no less renowned as an orator and scholar, and is a professor in the University at Pisa. His oration at Arquà on the occasion of the Petrarch festival we have already noticed. He has, moreover, found time to edit most admirably many of the Italian classics, and has been an industrious writer for various periodicals. Some of the more valuable of these contributions have been lately collected, and published under the title 'Studi Letterari' (Leghorn, 1874). The volume contains articles on the development of the national literature, Dante's minor poems, Dante's various fortune, and music and poetry among the cultivated world in Italy during the XIVth century. The first and longest article gives a history of the literature of the *cinquecento*, and is a fine specimen of the fruits of the new method in literary history. Other articles are also excellent, and will be welcomed by all students of early Italian literature.

## JAMES'S TALES AND SKETCHES.*

WHOEVER takes an interest, whether of mere curiosity or of critical foreboding, in the product and tendency of our younger literature, must have had his attention awakened and detained by the writings of Mr. James. Whatever else they may be, they are not common, and have that air of good breeding which is the token of whatever is properly called literature. They are not the overflow of a shallow talent for improvisation too full of self to be contained, but show everywhere the marks of intelligent purpose and of the graceful ease that comes only of conscientious training. Undoubtedly there was a large capital of native endowment to start from—a mind of singular subtlety and refinement; a faculty of rapid observation, yet patient of rectifying afterthought; senses daintily alive to every æsthetic suggestion; and a frank enthusiasm, kept within due bounds by the double-consciousness of humor. But it is plain that Mr. James is fortunate enough to possess, or to be possessed by, that finer sixth sense which we call the artistic, and which controls, corrects, and discontents. His felicities, therefore, are not due to a lucky turn of the dice, but to forethought and afterthought. Accordingly, he is capable of progress, and gives renewed evidence of it from time to time, while too many of our authors show premature marks of arrested development. They strike a happy vein at starting, perhaps, and keep on grubbing at it, with the rude helps of primitive mining, seemingly unaware that it is daily growing more and more slender. Even should it wholly vanish, they persist in the vain hope of recovering it further on, as if in literature two successes of precisely the same kind were possible. Nay, most of them have hit upon no vein at all, but picked up a nugget rather, and persevere in raking the surface of things, if haply they may

* 'A Passionate Pilgrim, and Other Tales. By Henry James, jr.' Boston: J. R. Osgood & Co.
'Transatlantic Sketches.' By the same author.

chance upon another. The moral of one of Hawthorne's stories is that there is no element of treasure-trove in success, but that true luck lies in the deep and assiduous cultivation of our own plot of ground, be it larger or smaller. For indeed the only estate of man that savors of the realty is in his mind. Mr James seems to have arrived early at an understanding of this, and to have profited by the best modern appliances of self-culture. In conception and expression he is essentially an artist and not an irresponsible *trouvère*. If he allow himself an occasional carelessness, it is not from incaution, but because he knows perfectly well what he is about. He is quite at home in the usages of the best literary society. In his writing there is none of that hit-or-miss playing at snap-dragon with language, of that clownish bearing-on in what should be the light strokes, as if mere emphasis were meaning, and naturally none of the slovenliness that offends a trained judgment in the work of so many of our later writers, unmistakably clever as they are. In short, he has *tone*, the last result and surest evidence of an intellect reclaimed from the rudeness of nature, for it means self-restraint. The story of Handel's composing always in full dress conveys at least the useful lesson of a gentlemanlike deference for the art a man professes and for the public whose attention he claims. Mr. James, as we see in his sketches of travel, is not averse to the lounging ease of a shooting-jacket, but he respects the usages of convention, and at the canonical hours is sure to be found in the required toilet. He does not expect the company to pardon his own indolence as one of the necessary appendages of originality. Always considerate himself, his readers soon find reason to treat him with considération. For they soon come to see that literature may be light and at the same time thoughtful; that lightness, indeed, results much more surely from serious study than from the neglect of it.

We have said that Mr. James was emphatically a man of culture, and we are old-fashioned enough to look upon him with the more interest as a specimen of exclusively *modern* culture. Of any classical training we have failed to detect the traces in him. His allusions, his citations, are in the strictest sense contemporary, and indicate, if we may trust our divination, a preference for French models, Balzac, De Musset, Feuillet, Taine, Gautier, Mérimée, Sainte-Beuve, especially the three latter. He emulates successfully their suavity, their urbanity, their clever knack of conveying a fuller meaning by innuendo than by direct bluntness of statement. If not the best school for substance, it is an admirable one for method, and for so much of style as is attainable by example. It is the same school in which the writers of what used to be called our classical period learned the superior efficacy of the French small-sword as compared with the English cudgel, and Mr. James shows the graceful suppleness of that excellent academy of fence in which a man distinguishes by effacing himself. He has the dexterous art of letting us feel the point of his individuality without making us obtrusively aware of his presence. We arrive at an intimate knowledge of his character by confidences that escape egotism by seeming to be made always in the interest of the reader. That we know all his tastes and prejudices appears rather a compliment to our penetration than a proof of indiscreetness on his part. If we were disposed to find any fault with Mr. James's style, which is generally of conspicuous elegance, it would be for his occasional choice of a French word or phrase (like *bouder, se reconnaît, banal*, and the like) where our English, without being driven to search her coffers round, would furnish one quite as good and surer of coming home to the ordinary reader. We could grow as near surly with him as would be possible for us with a writer who so generally endears himself to our taste, when he foists upon us a disagreeable alien like *abandon* (used as a noun), as if it could show an honest baptismal certificate in the registers of Johnson or Webster. Perhaps Mr. James finds, or fancies, in such words a significance that escapes our obtuser sense, a sweetness, it may be, of early association, for he tells us somewhere that in his boyhood he was put to school in Geneva. In this way only can we account for his once slipping into the rusticism that "remembers of" a thing.

But beyond any advantage which he may have derived from an intelligent study of French models, it is plain that a much larger share of Mr. James's education has been acquired by travel and through the eyes of a thoughtful observer of men and things. He has seen more cities and manners of men than was possible in the slower days of Ulysses, and if with less gain of worldly wisdom, yet with an enlargement of his artistic apprehensiveness and scope that is of far greater value to him. We do not mean to imply that Mr. James lacks what is called knowledge of the world. On the contrary, he has a great deal of it, but it has not in him degenerated into worldliness, and a mellowing haze of imagination ransoms the edges of things from the hardness of over-near familiarity. He shows on analysis that rare combination of qualities which results in a man of the world, whose contact with it kindles instead of dampening the ardor of his fancy. He is thus excellently fitted for the line he has chosen as a story-teller who deals mainly with problems of character and psychology which spring out of the artificial complexities of society, and as a translator of the impressions received from nature and art into language that often lacks only verse to make it poetry. Mr. James does not see things with his eyes alone. His vision is always modified by his imaginative temperament. He is the last man we should consult for statistics, but his sketches give us the very marrow of sensitive impression, and are positively better than the actual pilgrimage. We are tolerably familiar with the scenes he describes, but hardly knew before how much we had to be grateful for. *Et ego in Arcadia*, we murmur to ourselves as we read, but surely this was not the name we found in our guide-book. It is always *Dichtung und Wahrheit* (Goethe knew very well what he was about when he gave precedence to the giddier sister)—it is always fact seen through imagination and transfigured by it. A single example will best show what we mean. "It is partly, doubtless, because their mighty outlines are still unsoftened that the aqueducts are so impressive. *They seem the very source of the solitude in which they stand;* they look like architectural spectres, and loom through the light mists of their grassy desert, as you recede along the line, with the same insubstantial vastness as if they rose out of Egyptian sands." Such happy touches are frequent in Mr. James's pages, like flecks of sunshine that steal softened through every chance crevice in the leaves, as where he calls the lark a "disembodied voice," or says of an English country-church that "it made a Sunday where it stood." A light-fingered poet would find many a temptation in his prose. But it is not merely our fancies that are pleased. Mr. James tempts us into many byways of serious and fruitful thought. Especially valuable and helpful have we found his *obiter dicta* on the arts of painting, sculpture, and architecture; for example, when he says of the Tuscan palaces that "in their large dependence on pure symmetry for beauty of effect, [they] reproduce more than other modern styles the simple nobleness of Greek architecture." And we would note also what he says of the Albani Antinoüs. It must be a nimble wit that can keep pace with Mr. James's logic in his æsthetic criticism. It is apt to spring airily over the middle term to the conclusion, leaving something in the likeness of a ditch across the path of our slower intelligences, which look about them and think twice before taking the leap. Courage! there are always fresh woods and pastures new on the other side. A curious reflection has more than once flashed upon our minds as we lingered with Mr. James over his complex and refined sensations: we mean the very striking contrast between the ancient and modern traveller. The former saw with his bodily eyes, and reported accordingly, catering for the curiosity of homely wits as to the outsides and appearances of things. Even Montaigne, habitually introspective as he was, sticks to the old method in his travels. The modern traveller, on the other hand, superseded by the guide-book, travels in himself, and records for us the scenery of his own mind as it is affected by change of sky and the various weather of temperament.

Mr. James, in his sketches, frankly acknowledges his preference of the Old World. Life—which here seems all drab to him, without due lights and shades of social contrast, without that indefinable suggestion of immemorial antiquity which has so large a share in picturesque impression—is there a dome of many-colored glass irradiating both senses and imagination. We shall not blame him too gravely for this, as if an American had not as good a right as any ancient of them all to say, *Ubi libertas, ibi patria*. It is no real paradox to affirm that a man's love of his country may often be gauged by his disgust at it. But we think it might fairly be argued against him that the very absence of that distracting complexity of associations might help to produce that solitude which is the main feeder of imagination. Certainly, Hawthorne, with whom no modern European can be matched for the subtlety and power of this marvellous quality, is a strong case on the American side of the question.

Mr. James's tales, if without any obvious moral, are sure to have a clearly defined artistic purpose. They are careful studies of character thrown into dramatic action, and the undercurrent of motive is, as it should be, not in the circumstances but in the characters themselves. It is by delicate touches and hints that his effects are produced. The reader is called upon to do his share, and will find his reward in it, for Mr. James, as we cannot too often insist, is first and always an artist. Nowhere does he show his fine instinct more to the purpose than in leaving the tragic element of tales (dealing as they do with contemporary life, and that mainly in the drawing-room) to take care of itself, and in confining the outward expression of passion within the limits of a decorous amenity. Those who must have their intellectual gullets tingled with the fiery draught of coarse sensation must go elsewhere for their dram; but whoever is capable of the aroma of the more delicate vintages will find it here. In the volume before us

"Madame de Mauves" will illustrate what we mean. There is no space for detailed analysis, even if that were ever adequate to give the true impression of stories so carefully worked out and depending so much for their effect on a gradual cumulation of particulars each in itself unemphatic. We have said that Mr. James shows promise as well as accomplishment, gaining always in mastery of his material. It is but a natural inference from this that his "Roderick Hudson," now going on in the *Atlantic Monthly*, is the fullest and most finished proof of his power as a story-teller. Indeed, we may say frankly that it pleases us the more because the characters are drawn with a bolder hand and in more determined outline, for if Mr. James need any friendly caution, it is against over-delicacy of handling.

## SARGENT'S POLITICAL REMINISCENCES.*

MR. SARGENT'S book belongs to that useful and popular class of works which consist mainly of personal reminiscences, and which thus rank among the best of historical materials. It is at the same time so arranged and so combined with other materials as to form a pretty complete political history of the period which it embraces, thus justifying its more comprehensive title. We think, however, that most readers will wish that its compass had been a little different. The history of the American Republic before the civil war falls into two distinct epochs, the one ending with John Quincy Adams's Administration, the other with Mr. Buchanan's. The events and the issues of Mr. Monroe's and Mr. Adams's Administrations—except those connected with the alleged Coalition—stand by themselves in Mr. Sargent's narrative, and have for the most part passed out of the thoughts and associations of the present generation. But with General Jackson began a new set of causes and influences, which only reached their full effect in the civil war. It is natural enough that Mr. Sargent should not have been "disposed to enter upon that tempestuous Kansas-Nebraska period." Nevertheless, the unity and completeness of his work demanded it, and it is precisely what his readers would have especially enjoyed. After all, we may be grateful for what we have. The book is very readable, trustworthy so far as we can judge, fair in its tone, well fitted to serve as a political history of the years which it covers.

Absolute impartiality the author disclaims. He was an "Old-Line Whig," and writes always from this point of view. This, of course, we could not wish to have otherwise. The sentiments and prejudices of any period, as they have powerful influence at the time, so form an important element in the historical aspect of that period, and the Whig party was one whose sentiments and prejudices cannot fail to inspire a considerable degree of respect even since its overthrow. It was in a large degree the party of culture and refinement, it embodied the traditions of English and American political life, it opposed as well as it could the vulgar and intolerant partisanship of the dominant party. For there is no question that the Democratic was the dominant party—the party that represented the principles and policy which then actuated the American people.

We have recently read an interesting anecdote in illustration of the historical treatment of Guizot, the constitutionalist, and Michelet, whose principle of working was "to seek life wherever it was to be found." "One day, as M. Monod tells us, Guizot was criticising the exuberance of the poetry of India. Michelet, who was present, burst in with, 'Vous ne pouvez le comprendre, vous avez toujours haï la vie.'" The Whig party, as we have said, embodied the old English traditions—the traditions, that is, of historical liberty—traditions of a great, heroic life of constitutional development; far be it from us to say, of a dead conservatism, but of features of liberty which were essentially conservative. The Democratic party represented, we will not say progress—for it was often disastrously retrogressive—but the *life* of the nation; a young, rude, grasping nation, whose life was coarse, callow, and violent, but still exuberant. Had the Whig party, with its culture and integrity, possessed also courage and clearness of vision, it might have tempered the rank and aggressive temper of the Democratic party, and the two would have united to create a lofty and wholesome national life. It was no doubt because of its possession of this prime quality of courage that the Democratic party was selected as the organ of the slavery propagandism of the day. Mr. Calhoun and the South Carolina school of statesmen had no natural affiliation with a party led by men like Van Buren, Cass, Woodbury, and Buchanan. But they had definite purposes of their own, and shrank from no act and from no consequence. The Democratic party of the North had a sufficient intellectual ground of sympathy in the doctrines of State-rights and Strict Construction: it had, too, abundance of courage, and a strong if not a high ambition; the partnership was effected; and nothing is more striking in Mr. Sargent's pages, as nothing was more astounding at the time, than Mr. Calhoun's deliberately attaching himself to Mr. Van Buren's fortunes at the very moment that they seemed desperate.

The circumstances of the political revolution of 1840 must impress every observer as possessing a strong resemblance to the present political aspect of the times. The Democratic party had been in power for twelve years, doing the work which the community demanded to have done, just as has been the case now under the long régime of the Republican party. It was swept out of power by the indignation of the same community, through a party which represented the conservative element in politics, but which at the same time recognized a higher standard of political integrity—the quality felt to be most needed. At the present day, it is the Republican party that has embodied the life of the nation for now sixteen years, and has by virtue of this maintained its hold of power. But it is the Democratic party that is now the mouthpiece of traditional English liberty, local self-government, freedom from arbitrary arrest and illegal acts of power, maintenance of parliamentary privileges, supremacy of the civil over the military authority. When to this is joined a degree of dishonesty in official circles which reminds one strongly of "Price and Swartwout," one is at no loss to explain the reaction of 1874.

The interest of a book like Mr. Sargent's consists largely in personal anecdotes, of which there are a great many good ones, very well told. This incident in relation to Judge McLean is instructive; he was, it will be remembered, Postmaster-General under Monroe, Adams, and Jackson:

"As Mr. McLean had always refused to make appointments and removals on the ground of party affinities, and had strongly condemned such a practice, the enquiry was naturally made: 'If General Jackson adopts this policy, what will Mr. McLean do? Will he carry it out or refuse?' This question was so often put, and so emphatically answered by his nearest friends in the negative, that the General deemed it proper to come to an understanding with, and sent for, Mr. McLean, to whom he stated that he should adopt the policy of removing from office such persons as had, during the canvass for President, taken an active part in politics, and asked whether he had any objection to this line of action. To this Mr. McLean replied in the negative; 'but,' said he, 'if this rule should be adopted, it will operate as well against *your* friends as those of Mr. Adams, as it must be impartially executed.' To this General Jackson made no reply; but, after walking up and down the room several times, as if cogitating with himself, he said, 'Mr. McLean, will you accept a seat upon the bench of the Supreme Court?' This was answered in the affirmative; and he was in due time nominated" (vol. i., p. 166).

This incident was related to the writer the following day by Gen. Cass. In the second volume we have an account of the efforts made in 1840 to put an end to this mischievous practice. Possibly they might have succeeded but for Mr. Tyler's accession to the Presidency and to the Democratic party.

The style of the book can be seen from the extract just given. It is not free from faults, but, on the whole, it is in good taste, as we might expect from a literary representative of the cultivated and conservative Whig party. Mr. Sargent belongs to a school of newspaper writers who did not think it necessary to express emphasis by picking out striking phrases from the middle of a sentence at due intervals and printing them in small capitals as if they described divisions in the subject. There are two or three instructive points of comparison suggested by this book between the manners and usages of this former generation and the present time. Everybody knows, for instance, what a disgraceful scene was presented at Gen. Jackson's inauguration by the mob, when it took possession—as well literally as metaphorically—of the White House. Here we have certainly improved, even although the etiquette of the White House has been infringed, as, for instance, in respect to the rule (vol. ii., p. 24) "established by Washington, and observed by every President down to Mr. Johnson, of never being the guest of others." Indecent and reckless calumny was certainly never more rank than in those early days of the Republic; no doubt for the reason that politics were more earnest then than now. The Democratic period of 1829 to 1841 was as notorious for dishonesty and maladministration as the recent Republican one; the difference, if any, would seem to be, in fact, that its long continuance and the connivance of almost every Administration have made it harder to rouse the public indignation, and have resulted in an almost listless and despairing acquiescence in corruption.

We will close with an incident which will be remembered by many who have forgotten the name of the person concerned. After Mr. Adams's stroke of paralysis at his house in Quincy, he did not make his appearance in the

* 'Public Men and Events, from the Commencement of Mr. Monroe's Administration in 1817 to the close of Mr. Fillmore's Administration in 1853. By Nathan Sargent, late Commissioner of Customs (formerly known as a political writer under the *nom de plume* of "Oliver Oldschool").' Philadelphia: J. B. Lippincott & Co. 1875. 2 vols. 8vo.

House of Representatives until February 13, 1847. The debate was at once interrupted :

"Mr. Moseley of New York, and Mr. Holmes of South Carolina, advanced to Mr. Adams, and, each taking him by an arm, conducted him to the seat he had for many years occupied, and which had been taken at the opening of the session by Mr. Andrew Johnson, who declared at the time that he took it to surrender it to Mr. Adams if they should again have the pleasure of his presence in that hall. Mr. Johnson now gracefully surrendered it ; members gathered around the venerable man, with congratulations on his return ; and after two or three minutes' pause, much affected by the tender cordiality of his reception by the House, he rose, and, in a feeble voice, briefly tendered his heartfelt thanks" (vol. ii., p. 310).

---

*Personal Reminiscences of Cornelia Knight and Thomas Raikes.* Bric-à-Brac Series. Edited by R. H. Stoddard. (New York : Scribner, Armstrong & Co. 1875.)—Always premising that we are not fond of books of extracts, which give us a disagreeable sense of being fed with a spoon, we may admit that Mr. Stoddard is doing a tolerably useful work. "Useful," indeed, is perhaps strong language, for Mr. Stoddard's process converts his authors into gossip-mongers pure and simple, and his compilations appeal especially to that class of readers whose first glance in their morning paper is always for the "personal" column. Mr. Stoddard undertakes to furnish them with as much gossip as possible, at the least possible trouble to themselves. He not only does their reading for them, but he does their skipping, or most of it, and saves them all necessity for the exercise of discrimination. It often seems to us, we confess, that the art of reading-made-easy is going a trifle too far. The resolving of literary matter into gelatinous broth, warranted to demand none of the onerous labor of mastication, is a practice which doubtless keeps the literary *cuisine*, as we may say, in a thriving state, but which can hardly fail in the long run to have a relaxing effect on the literary appetite. Triviality is at a premium and gravity is at a discount ; books on serious subjects have to apologize for taking a serious tone, and shrewd publishers are observed to slip in hints that things have been so arranged that such works do not really require the reader to think so very hard as might be feared.

We must not preach a sermon out of season, however, for it is doubtless not an unpardonable desecration to chop up into convenient morsels the voluminous prose of Miss Knight and Mr. Raikes. Miss Knight's 'Memoirs,' published in London some fifteen years ago, have a livelier interest than the Reminiscences of her companion. It is often said that the average bright woman tells a better story and talks to better purpose than the average clever man ; here, perhaps, is an example of it. The strong point with both of these venerable gossips was rather in their remarkable opportunities than in any great natural wit. Miss Knight, indeed, had evidently plenty of good sense, and Mr. Raikes was, we should say, a trifle purblind—witness, for example, the extreme vapidity of his account of the last years of Beau Brummel. But they were both spectators of the social game, not players. Miss Knight's chief title to distinction was her having been for some time lady-companion to the Princess Charlotte, daughter of George IV. and heiress presumptive to the crown. Of this Princess Miss Knight gives an interesting account, and, indeed, as the hapless daughter of George IV. and that poor Queen Caroline who was deemed of inadequate virtue even to be *his* consort, she is a figure that appeals to one's sympathies. Miss Knight, during her attendance upon the Princess, was frequently in contact with the Regent, whom she evidently did not like, though it is curious to observe in what respectful terms she conveys her impressions of him. It mattered little to the Regent himself, presumably ; but on one occasion he must have perceived that he was not in favor with his daughter's *dame de compagnie*. He had suddenly broken up the Princess Charlotte's household. "He repeated," says Miss Knight, "his apology for putting a lady to the inconvenience of leaving the house at so short a notice, and I replied that, my father having served his Majesty for fifty years, and sacrificed his health and fortune to that service, it would be very strange if I could not put myself to the temporary inconvenience of a few hours" This sounds like a speech of one of Thackeray's women. Miss Knight's style is generally rather dry, but there is here and there a touch in the way of portraiture which reminds one of the manner of the clever French memoirs. "The good Duchess of Leeds had no inclination to quarrel with anybody. Provided that she might ride two or three times a week at Hall's—a second-rate riding school—on an old quiet horse for exercise, get into her shower-bath and take calomel when she pleased, dine out and go to all parties when invited, shake hands with everybody, and touch her salary, she cared for nothing more ; except when mischievous people, to plague her, or envious gossips, to find out what was going on, talked to her about Princess Charlotte's petticoats being too short, of her Royal Highness nodding instead of bowing, or talking to the maids of honor at chapel between the prayers and the sermon." Miss Knight had lived many years in Italy before living with the Princess Charlotte, and on the death of her mother, at Naples, in 1798, had placed herself under the charge of the famous Lady Hamilton. It was with the Hamiltons and Lord Nelson that she returned to England—rather singular auspices for a young woman who was to become a custodian of the proprieties near a young princess. Miss Knight, however, was apparently not a Puritan ; she regarded the Countess of Albany, wife of the Pretender, whom she had left to live with Alfieri, as a person quite as good as she should be. Miss Knight saw much of society in Rome in the last years of the last century, and her reminiscences are sufficiently amusing. "At supper his Majesty (Gustavus III., King of Sweden) was seen to scratch his head with his fork, and also with his knife, and afterwards to go on eating with them." Of the philanthropic Emperor of Austria, on the other hand (Joseph II.), who was in Rome at the same time, her anecdotes are in the highest degree complimentary.

Mr. Raikes's reminiscences, as here extracted, relate principally to the Duke of Wellington, Talleyrand, and the Orleans family—Louis Philippe being with him a pet object of aversion. It is mostly, as we have said, rather thin gossip, and not redeemed by any very acute perception of character on the author's part. Here is a *mot* of Talleyrand which we do not remember to have seen before. A person asked him "to explain to him the real meaning of the word non-intervention." His reply was : "*C'est un mot métaphysique et politique qui signifie à peu près la même chose qu'intervention.*" Another, perhaps, is better known. A gentleman complained to Talleyrand of having been insulted by a charge of cheating at play, and a threat of being thrown out of the window on a repetition of the offence. Indignant and smarting, he asked for advice. "I advise you," said Talleyrand, "never to play again but in the basement." Of the various unflattering memories of George IV. that have lately been given to the world, one that Mr. Raikes quotes from the Duke of Wellington is perhaps the worst : "I found him in bed dressed in a dirty silk jacket and a turban night-cap, one as greasy as the other ; for notwithstanding his coquetry about dress in public, he was extremely dirty and slovenly in private." If even this monarch's personal elegance was a humbug, there is but little left to him.

---

*A Summary of Modern History.* Translated from the French of M. Michelet, and continued to the present time, by M. C. M. Simpson, translator of 'Napoleon Bonaparte's Letters to King Joseph,' 'Memoir, Letters, and Remains of Alexis de Tocqueville,' etc. (New York : Macmillan & Co. 1875. 16mo, pp. 376.)—Probably there is no historian of equal eminence whose merits are so hard to estimate fairly, or who is the subject of such various judgment, as Michelet. For native genius we should hardly know whom to place above him, and his acquirements were certainly surpassed by few. Add to this an unquestioned sincerity and a style remarkably brilliant and graphic, and we have a rare combination of great qualities. Unfortunately, he gives the impression of one whose imagination and theories ran away with him, and it must be confessed that his most plausible theories—as in his Roman history and in regard to the contest of Austrasia and Neustria in the first volume of his 'History of France'—are not supported by the solid scholarship of later enquirers. Naturally, he has got a somewhat suspected name, as not always and altogether sound. Then, again, his style is one of those that easily fall into manner, a tendency which grew upon him in his later years, so as to be positively unpleasant at times, as was also his fondness for generalities, as well as a certain vague habit he had of talking round a thing instead of telling it directly. In short, while his merits have gained him the most enthusiastic admiration, these faults have procured him the heartiest and most disdainful censure.

The book before us, written in his early years, possesses all his merits with few of his faults. It is a very small book to contain the history of four hundred years (from 1453), and yet it would be hard to find this same period told in double the number of pages with anything like the vividness and attractiveness that we find here. His statements of the general current of events are every way admirable ; and in the treatment of the details we have little fault to find on the score of fairness and impartiality. We would instance the sketches of the Reformation and the religious wars, in particular the account of the introduction of the Reformed religion in the countries of the North, and, in connection with it, the interesting career of the disreputable Christian II. Altogether, his selection of

detail shows the hand of a master. Neither are his French prejudice so conspicuous and offensive as one would expect from a Frenchman, and from Michelet above all. Still, he has no words of censure for the ravaging of the Palatinate and the seizure of Strassburg; and one would gather from this book that it was solely owing to Richelieu's influence that Gustavus Adolphus entered into the Thirty Years' War. For the same reason, doubtless, the character given of William III. is far less favorable (p. 250) than we are accustomed to. There are some admirable summaries of leading events and dates, arranged under the heads of the several countries, and inserted as foot-notes in finer type. Good as they are, however, they would be improved by being spread out in separate lines and more carefully grouped. They are sometimes compressed to the point of obscurity, for instance: "1688, Election of the Archbishop of Cologne"; "1705, confiscation of Bavaria." What can the student suppose these dates to mean? for they are not explained in the text. Neither are the details always well-selected or accurate. In the reign of Charles II. (p. 241), the Cabal is said to continue from 1670 to 1683, instead of from 1667 to 1674, and nothing is said of either Danby, Temple, or Halifax. The Declaration of Rights is given, but not the Bill of Rights, and the Act of Settlement is called the Act of Succession. On page 243 we have some very wild American dates: "Foundation of the State [!] of Massachusetts, 1621; of the town of Boston, 1627; States of Maryland, 1632; of Rhode Island, 1634; of New York [!] and of New Jersey, 1635; of Connecticut, 1636" —every one of them wrong, and Virginia omitted. On page 195, the Great Elector is called the son instead of the grandson of John Sigismund, and, by the way, we can find no account of the Great Elector at all commensurate with his importance, and no clear statement of his relations with Sweden and Poland. Charles II. of Spain is called (p. 262) Charles VI. The death of President Lincoln is placed (p. 347) at Boston, and on the next page the Geneva award is said to have excited the "amazement of all sober judges." This, of course, is in Mr. Simpson's continuation. The translation is excellent; only the statement (p. 242) that in 1706 England and Scotland were *reunited* bears traces of the original *réunis*.

---

*Nature and Life.* Facts and Doctrines relating to the Constitution of Matter, the new Dynamics, and the Philosophy of Nature. By Fernand Papillon. Translated from the second French edition by A. R. Macdonough, Esq. (New York: D. Appleton & Co. 1875.)—This is a collection of essays on various physiological subjects. The author, recently dead, was one of that little band of "*vulgarisateurs*" whom the *Revue des Deux Mondes* employs to serve up to the general reader a nicely-prepared account of the most recent discoveries and speculative tendencies in the various branches of human knowledge. All readers of that worthy periodical know the style of article: a little flourish at the beginning, about a page long, containing some nicely-said generalities, which form an introduction; then a series of sections headed I., II., III., which always give a well-digested and, above all, well-composed account of the facts, written with that fatal polish and fluency which make the work of one contributor to this periodical absolutely indistinguishable in style from that of all the rest; then, to conclude, a little gush of enthusiasm, moral or philosophic, *bien senti;* the whole bedewed at intervals with those graceful tributes, dear to the ears of Frenchmen, and which none can pay with so light a hand as they, to the great names in science or to the great principles in philosophy which every well-conditioned reader is expected to salute as it were in passing, if only for the sake of showing that he too belongs to that part of society which is not ignorant of the "bonnes et saines traditions," and which knows where respect is due. This excessive urbanity, with the diffuseness that accompanies it, is a little tedious to the English reader. If he disagrees with a philosopher, for instance, it annoys him to have to avoid the appearance of rude manners by saying: "The certain and enduring fame of Descartes is great enough to permit us, without fear of dimming its deserved lustre, to pronounce sentence of impotence upon false principles borrowed from his teachings," etc., etc., after the fashion of our author.

Of their class, we may say that M. Papillon's articles are among the very best. The essays on life, in its relation to light, heat, electricity, odors, medicaments, with those on animal grafts, ferments, epidemics, death, and heredity, in addition to their charming style, contain facts and theories which the non-special reader is not likely to meet with elsewhere, and which are calculated to interest every intelligent person. The first hundred pages of the volume are taken up with the author's views of the philosophy of nature. Concerning them few words must suffice us, not because they seem to us to be in themselves of no importance, but because they await a robuster expounder than they have received as yet in France. A rewatering of the well-watered thoughts of Janet, Lévêque, and Vacherot can hardly yield much mental pabulum. These writers, adopting recent scientific theories about the conservation of energy and the constitution of matter, spiritualize the latter by identifying its force with the will-force, which is the only one of which we have any immediate personal experience. Matter is motion, motion is force, force is will. "The science of motions and of the form they take shows us only the outside of the energy of the universe. The science of life, on the contrary, unveils to us its throbbing heart and its splendid plan." M. Papillon works out with these data a sort of Leibnitzian monadism. One of the most interesting articles in the book, in fact, is that entitled Leibnitz's Ideas. To many readers, no doubt, this philosophy will be very suggestive.

We have only to add that the translation is not wholly freed from Gallicisms, especially in proper names. Some mistranslations of scientific terms (as, *e.g.*, the conjunctiva tissue, instead of connective tissue) occur; and on the bottom of p. 327 the translation of the word *perçoit* by "perceives" entirely obscures the sense. It means here "is touched by" or "responds to."

---

*The History of Lawyers, Ancient and Modern.* By William Forsyth, author of 'History of Trial by Jury,' 'Life of Cicero,' etc., etc. With Illustrations. (Boston: Estes & Lauriat.)—Those who have read Mr. Forsyth's 'Life of Cicero' know the author as an extremely clever writer. Whatever may have been the merits of the view of Cicero's character presented by him, there can be no doubt that the picture was vivid and interesting, that the book was well written, and made the men and scenes described live and move again with a real life and motion. Mr. Forsyth is a classical scholar, and at the same time no pedant. He is as thoroughly at home when he gives an account of a forensic contest in Greece or Rome as when he is describing a trial in an English court. Indeed, we should be inclined to say almost too much at home, for he is one of that band of classical scholars who insist on giving vividness to their translations from Greek and Latin words by finding exact English equivalents for technical or professional words, for which there are really no exact equivalents in English. For instance, Mr. Forsyth thinks it pedantic to translate ὦ ἄνδρες δικασταὶ by "O Dicasts," and that it gives a more lively idea of the scene in an Athenian court if we render it "Gentlemen of the jury." Unquestionably it gives a more lively idea, but, unless we are greatly mistaken, much of the liveliness comes from the sense of novelty and sharp contrast between the notion called up by the word "dicast" and that called up by "gentlemen of the jury." When we think of the former, it is of a large popular body, five hundred at the least in number, swayed by every sort of popular passion and prejudice, discriminating very vaguely between fact and law and various degrees of evidence, or even between matters of a civil and criminal nature; in many cases, as Mr. Forsyth himself admits (p. 31), becoming a "mob"; on the other side, we have a small body of twelve men, surrounded on every side with safeguards and limitations, presided over by a judge of whom they are generally in dread, never allowed to consider evidence which may be even supposed to influence their weak minds improperly, permitted to be judges only of facts, and absolutely prevented by our forms of procedure from confounding civil with criminal charges. It is difficult to believe that the "dicast" caricatured in the 'Wasps' would feel at all at home in the jury-box described by Blackstone or Kent. This may seem a small matter, but it is really a vice which runs through all Mr. Forsyth's discussions of classical subjects—as where (p. 36) we find him extending his notion of the similarity between Grecian and Anglo-Saxon procedure so far as to say that "we may call a vote of the Ecclesia that an accused person shall be put upon his trial 'the finding of the grand jury.'" Yet the author does not deny that there are limits to this sort of license, and is very doubtful as to the taste of the Dutch commentator who always translated "consul" by "burgomaster." But we must allow the Dutch the same liberty we allow ourselves in these matters. After all, the main thing is that we should know what a dicast was, not that we should translate the word by some remote English analogue.

Mr. Forsyth has confined his attention in the present volume to Greece and Rome, France and England; and his object has rather been to make a popular account of the subject for the laity than to write a thorough-going history of the bar. In this he has certainly succeeded. For Greece, Rome, England, and France he has given a summary outline of the origin and power of the courts of law and systems of procedure, with abundant references to well-known cases as illustrating the condition of the profession at particular times and places. We do not find many things in the book that are new to lawyers; the chapter on the French bar contains more out-of-the-way information than any other.

Though great innovations have been introduced into the practice of the law in this country, it is probably as yet too soon to estimate their full effect or to expect the United States to furnish an additional chapter for a genuinely philosophical treatise, though it certainly might for a popular work like this. The influence, social and political, of the bar in America shows that the connection between the prosperity of the profession and free institutions is no mere fancy suggested by the history of Rome, Greece, and England, but a general fact, and it has been pretty clearly proved, too, that all attempts to destroy the exclusiveness of the profession, whether by breaking down the barriers in the way of admission or by making the methods of selecting judges popular, have a bad tendency on the *morale* of the bench as well as the bar. What will be the verdict of posterity on more technical questions, the union of the duties of attorneys and barristers, the abolition of the rules of pleading, and so on, remains to be seen.
